THE

WORKING MAN:

A Weekly Record of Social and Industrial Progress.

"ALL LABOUR IS SACRED."

VOLUME I.

LONDON:
CASSELL, PETTER, AND GALPIN, LUDGATE HILL, E.C.

1866.

[ALL RIGHTS OF TRANSLATION AND RE-PRODUCTION ARE RESERVED.]

CASSELL PETTER, AND GALPIN
LA BELLE SAUVAGE YARD

PREFACE.

The completion of the First Volume of the Working Man affords us an opportunity of acknowledging the cordial co-operation and support with which our readers have seconded our earnest endeavours to establish a Journal having for its aim the realisation of the bright prospects so eloquently alluded to by Mr. Gladstone, when he said that "the nineteenth century is undoubtedly, in a new and peculiar sense, the century of the working man; it is the century which has seen his position raised, his circumstances improved, new means organised for his benefit, new prospects opened for the future; and he has before him a prospect which, as I trust, nothing can mar, of increased weight, increased consideration, increased usefulness, increased happiness, in the generations to come."

Our undertaking was, at the outset, surrounded with numerous difficulties. We had, in a great measure, to become our own pioneers, and to ascertain whether or not the time had arrived when the people of the United Kingdom were prepared to welcome the advent of a Journal intended to assist in the promotion of the intellectual, social, and industrial welfare of the various classes of workers, whether with the hand or the brain. Our programme was of the most comprehensive character, embracing, as it did, the whole range of subjects affecting the industrial community, and we have zealously attempted to carry it out, with what degree of success we leave the pages of the Working Man to testify.

We have made our readers familiar with the characteristics of some of the great Workshops of the World; told them of the leading Working Men's Industrial Exhibitions, Working Men's Recreations, and books for the Working Man's Library; informed them of the progress made by Working Men's Clubs, Co-operative Societies, and similar associations; besides furnishing much useful information respecting Emigration and the Labour Market in the Colonies. We have also devoted considerable space to the Working Man's Means of Education and Self-Improvement, the Working Man at Home, Unhealthy Trades and Occupations, the Investment of Savings, Provision for Sickness and Old Age, Wages, Trade Disputes, Strikes, Lock-outs, and other important topics. Art and Science have likewise found a place in our pages. The Art Workman has been both encouraged and instructed, while the Students of Chemistry and Mechanical Science have found much that was interesting and novel. In the department of Biography we have given portraits and illustrative memoirs of the more celebrated Men who have risen from the Ranks, as well as of those who have, by their example, adorned the station in which they remained.

These and many other features of the present volume of the Working Man all tend to show the wide range of subjects embraced by our programme.

In our next volume we shall aim at an even wider sphere of usefulness, by combining political topics with social and industrial questions, and thus rendering our Journal the true reflex of the British Working Man; aiming to be not only his favourite by the household hearth, his friend in the workshop, and his advocate in the social and political world, but the fearless and enlightened exponent of those glad and happy aspirations which bid him regard the present as the stepping-stone to the future, when the dream of labour shall be realised, and the pathway of the worker become less clouded and less beset with difficulty and care.

La Belle Sauvage Yard, London, June, 1866.

THE MANUFACTURE OF GOBELINS TAPESTRY AND CARPETS.

The Imperial Gobelins Factory.

THE Gobelins Factory at Paris holds the first rank among the workshops of the world, both on account of the magnificence of its productions, and the influence it has exercised on certain important branches of art-manufacture. In these particulars it is emulated by the Imperial Porcelain Factory at Sèvres.

The renown of the Gobelins factory is based on the production of tapestry of the highest artistic excellence: the manufacture in the loom, with silk and wool, of fac-simile copies of paintings by the most renowned artists of Europe. The degree of excellence, not to say perfection, to which this art manufacture has been carried, was well shown in the specimens exhibited at the Great Exhibition of 1851, which astonished and delighted all who took the pains to examine them.

The Gobelins tapestry is, in truth, a royal manufacture: it stands alone, unrivalled and unimitated. Its products have no market; money cannot buy them. They figure only as presents to crowned heads and favourite subjects, and, as presents, are unique.

The existence of the Gobelins dates from the middle of the seventeenth century. It bears the name of a family of dyers from Rheims, who established themselves on the banks of the Biévre. Jean Gobelin, the head of the family, acquired much wealth and land on the banks of that river, and bought letters of nobility.

When the Gobelins quitted their factory, they sold it to the Messrs. Cauceye, who, to the dyeing-works of their predecessors, added the weaving of tapestry, with the aid of Flemish workmen, directed by one Jans. Gluck, a Hollander, succeeded them. Lastly, Colbert acquired from one Leleu the building rightly called the Gobelins; while the Gluck family united with another family named Julienne, and they continued, in the adjacent buildings, a dyeing-works, which was still in existence at the beginning of the present century.

At the commencement of the reign of Louis Quatorze, France was dependent on the rest of Europe for its art-manufactures. Louis was a munificent prince, and lavish in his expenditure. He built palaces, which required to be royally furnished. He conceived the idea of establishing a model workshop for the benefit of the artisans of his kingdom, in which skilled labour should be guided by the highest talent in art, not with the view of rivalling or destroying private industry by disproportionate competition, but to stimulate and direct it in its labours. In proceeding to carry out this view he established the royal workshops at the Gobelins.

But it was not merely a tapestry-factory that could satisfy the monarch's wants: he made the Gobelins a vast workshop, where everything that constituted furniture was designed and executed. Two hundred and fifty artisans wove the rich hangings, for which the king's chief painter furnished the designs, and for which the renowned Jacques Kerkoven dyed the silks and wools. Workers in gold and other metals cast and chiselled chandeliers and candelabra, the designs of which harmonised with those of the hangings; while cabinet-makers, carvers, and gilders turned, carved, and gilded the wooden furniture. Florentine artists, directed by Ferdinand Meglioriní, collected marble, agate, and lazulite, to compose those precious mosaics adorned with birds, fruit, and flowers, upon the tables of the palaces built during the reign of Louis XIV., which excite admiration to the present day. Not a bar to a window or a lock to a door but was a masterpiece of execution, from the designs furnished by the universal artist, Lebrun, who seemed to multiply himself, in order to satisfy all the monarch's demands upon his talent. What activity and harmony prevailed in the Hotel des Gobelins! Never before nor since has the world seen such a workshop.

Louis was liberal to those who pleased him, and the artisans of the Gobelins had no reason to complain that their labours were ill-requited.

Lebrun was director of the Gobelins from 1663 to 1690, the date of his decease. This was the most prosperous era the royal factory ever enjoyed. Several of this artist's best pictures, besides those of contemporary painters, were copied in tapestry. At his death Miguard was appointed his successor as painter to the king, and director of the Gobelins. The first years of his rule were fruitful in important works. A drawing-school was established in connection with the factory. But the reverses that befell the king during the latter part of his reign, compelled him to husband all his resources for the defence of his country. He was driven to the painful necessity of dismissing the greater portion of the workmen whom he had been at so much trouble and expense to get together and instruct. But the territory of France was invaded by a foreign foe, and art and luxury were as nothing in the presence of the dangers of the country. The marvels of art created by the goldsmith De Launy, were doomed to the melting-pots of the Mint, while the youngest of the tapestry-weavers were compelled to serve in the ranks of the army, and another portion, among the most skilful, was dismissed.

When peace was again restored, activity at the Gobelins was resumed; but from this date the Royal Furniture Factory gradually lost its cha-

racter, and eventually became only a factory for tapestry and carpets. The painters, sculptors, goldsmiths, and mosaic-workers disappeared one by one. No longer a school of arts, as it was under the directorship of Lebrun, its operations were at length limited to copying pictures, some of them being specially designed to serve as patterns for tapestry, while others were chosen for the sake of their subjects. When completed, the king gave them to other monarchs, or to those of his subjects to whom he wished to testify his satisfaction and esteem. At times, he made presents of those whose subjects were suitable to the clergy, to adorn their churches. There are tapestries of "Esther," and of "Jason and Medea," at Windsor Castle; and the Duke of Northumberland, with other wealthy English connoisseurs, were graciously permitted by the French monarch to acquire possession of some of these magnificent and rare products of the royal looms.

During the reigns succeeding that of Louis XIV. the tapestry looms of the Gobelins continued steadily at work, until the breaking out of the political struggles at the end of the last century threatened even the very existence of these admirable creations. The Gobelins, the Savonnérie, and Sèvres were no longer regarded as establishments of public utility, founded to oppose the importation of foreign products, and aid national industry deprived of models and examples; which not only prevented money leaving the country, but also attracted specie from rival nations. The republicans saw in them only establishments of useless luxury, the relations of which to external commerce they could not comprehend. On the 17th August, 1793, Marat wrote these lines in the *Ami du Peuple*:—"They have no idea abroad of fine art establishments, or rather of manufactories at the expense of the State. The honour of this invention belongs to France. Such are, among others, the manufactories of Sèvres and Gobelins. The first costs the public more than 200,000 francs annually, for a few porcelain services which the king makes presents to ambassadors: the other costs 100,000 francs annually, we do not well know for what, unless it be to enrich intriguants and rogues."

These were perilous times for the arts when they dared to lay violent hands on the masterpieces of past times, under the pretext that they contained emblems recalling the old form of government. One director of the Gobelins asked of the Home Minister, under whose prerogative were placed the former royal manufactures, permission to publicly burn, with great ceremony, some admirable pieces of tapestry representing *fleurs de lis*, and the former arms and ciphers of France. To the destroyers from zeal succeeded methodical destroyers, and a jury of *arts* was nominated to sit in judgment on works in progress, and condemn those that were offensive to the eyes of a republican.

The Gobelins factory comprises a dye-house, a chemical laboratory, schools of drawing and tapestry, a repairing workshop, and exhibition galleries, and the rooms in which the tapestries and Savonnérie carpets are made. The works of this *atelier* have a special character, which demands a new apprenticeship on the part of the dyers who have learned their art elsewhere. From 1804 to 1816, when the directorship of dyeing was temporarily suppressed, a practical school for the art of dyeing existed at the Gobelins. In 1824, M. Chevreul—to whom the arts are so deeply indebted for his researches upon colour—assumed the direction of this branch of the Gobelins, and from that date its usefulness has gone on steadily increasing, until the art of dyeing has become as profoundly studied as any branch of applied chemistry. Every year the director delivers a course of lectures upon the laws of colour, and their applications to the arts.

The two schools of drawing and tapestry are under the direction of a professor of drawing, assisted by a retired tapestry-weaver in the capacity of overlooker. Out-door pupils, in considerable numbers, are admitted to the drawing-school, which includes elementary drawing, the study of the antique, and of the living model.

It is scarcely possible to estimate the advantages conferred by this establishment on the important art of dyeing, an art that, in common with many others dependent on chemical principles, has made such immense progress during the present century, but which is now undergoing so complete a revolution as to render past experience nugatory.

All that we recognise as French art, which has so strongly influenced the taste and fashion of European and American communities, doubtless owes its origin to the first establishment of the Gobelins by Louis XIV.

Glasgow Industrial Exhibition.

GLASGOW is full of noble streets; yet it has no finer parallelogram of the commercial kind than its mile-long street from Cross to Anderson, composed of the ancient Trongate and Argyle Street. In the best part of Argyle Street is now opened the new Industrial Exhibition, thoroughly well arranged, and as attractive as any of which the public have heard. The interior of the building, with its three stories of galleries, presents a completeness and appropriateness of effect very pleasant to the eye. The works of art loaned to increase the allurements of the place, are worth several visits to see and study. Of the contents and quality of the articles that properly constitute the industrial portion of it, we must at another time speak.

The opening was more than usually ceremonial and characteristic of Scotland. All the members of Parliament and city magnates available were present. There were readings from the Scriptures, prayers, a song expressly written by Mr. Roy, and a procession over the Exhibition, headed by the Duke of Argyle, followed (we do not mean on foot, but in order of event) by speeches neither too long nor too many.

In the evening, in the City Hall, to accommodate the thousands who attended, his Grace the Duke of Argyle, delivered amid well-deserved applause, the inaugural address. The duke is popular in Glasgow, as indeed he is everywhere. Whatever his grace pleased to say in Glasgow would be sure to be applauded; but what he did say was so discriminating, so racy of the Scotch soil, and so appropriate, that the applause was due to the matter apart from the coronet. Whether the Duke of Argyle speaks as President of the British Association, at a Working Man's meeting, or at an Industrial Exhibition, he always makes himself master of his subject, however high, and is genial and attentive to it, however humble it may be. A short time ago, when his grace took the chair at Exeter Hall in the metropolis, at the Discussions of the Working Men's Club and Institute Union, he really watched the course of the debate with the integrity of a private gentleman, and reviewed, replied to, and summed up the remarks of the workmen present, speaking as one who had given actual attention to the subject only could have done.

In his inaugural address at Glasgow, he not only explained what the Exhibition was, but what such an Exhibition should be. His grace said—

Although I have had a comparatively cursory glance of the Exhibition, I can say that it contains a very much larger and fuller collection of objects of ingenuity, of beauty, and of art, than I for one was at all prepared to see on this occasion, and I rejoice specially to be assured that it is not merely an industrial exhibition opened for the benefit of the club connected with the working classes of Glasgow, but that it is *bonâ fide* an exhibition in which the greater part of the objects are contributed, and have been made, by working men. I am told that out of a total of 500 exhibitors, there are upwards of 400 who belong to the working classes. Now, gentlemen, I need hardly say that in some points of view it may be said that the whole Exhibition has come from the hands of working men, in the same sense that all that we have, and all that we enjoy, are the products of labour—the houses which shelter us, the raiment that covers us, the railways by which we travel, the ships which convey our commerce, almost all the objects, in short, of luxury or of art—all that dignifies and adorns our life, comes through the hands of working men. (Cheers.) But this is in somewhat a lower and more mechanical sense. Those objects which have been brought forward and made by the hands of working men in this Exhibition are theirs in a much higher sense than this, because they not merely come from the hands of working men, but they come from their heads also; theirs are not merely the hands that made them, but their minds have conceived and invented them; and every one of the objects that have been exhibited there to-day, combine both the work of the head and the heart, and they, therefore, in a higher sense than the objects I have named, belong to the working men, and have come from them.

After a very relevant and very readable historical sketch of the history of working-class progress, the inaugural speaker turned to city questions and country anecdotes. We quote a further passage:—

I rejoice to see that it is proposed to sweep away a great part of those habitations in Glasgow which are the dens necessarily of misery and vice, and to supply them by model lodging-houses for the superior class of artisans in the city. I have no doubt that a great part of the drunkenness often charged upon Glasgow comes from the persons who are lodged in those dens of wretchedness and vice, and also that the drunkenness of their habits has, to a great extent, arisen from the misery of the dwellings in which they are lodged. The sickness and fever rate in this district have been from 25 to 26 in the thousand per year—that is, in every thousand persons there are 25 to 26 laid up with fever every year; while, in the more healthy districts, the proportion of fever cases is less than 4 in the thousand. Fancy what an enormous difference in the health of a population—the difference between 4 and 25 or 26 in the thousand—simply owing to bad construction and defective ventilation of miserable dwellings. I don't know whether any gentleman present may be inclined to think that as one of the proprietors of houses in the country, I also have been neglecting my duty to the habitations of the poor. It is only of late years all of us have wakened up with regard to our duties in this matter. There are wretched habitations in the country, but still the more open they are, and the worse sheltered, the more free the supply of fresh air and fresh water. (Loud laughter and cheers.) I may illustrate what I have said about houses in the country by an anecdote of what happened to myself a few weeks ago. A poor woman came to complain to me very much of the condition of her house, which it appears that she or her husband—she was a widow—had placed in a spot of ground not very far above high tide, and occasionally when there was an unusually full tide the water invaded the house. The house, I may say, looking at it from the opposite arm of the sea, seemed a whitewashed and very comfortable cottage. But she came to me and said, "It's a very bad hoose." (Laughter.) "Well," I said, "my good woman, what's the matter with the 'hoose?' it looks to me a very fine 'hoose.'" "Oh," she said, "it's a vera fine hoose if I could keep the ocean oot." (Renewed laughter.) Now, at high tide, I have no doubt, it was a very uncomfortable "hoose;" but I would rather live in that "hoose," with the ocean coming into it, than in any of the wynds of Glasgow. The great agency capable of acting, and acting well, upon the conditions of labour, is the agency of individual thought and action. (Hear, hear.) The truth is, that this is the source, if we come to think of it, of all good in the world: after all, it is thought that rules the world, and it is generally the thoughts, the happy thoughts, the ingenious thoughts, the virtuous minds which give stimulus and impulse to the convictions of the community amongst which they live.

All this is gaily, nobly, and thoughtfully said, and no doubt will be read with profit and pleasure by the class for whose use these words are spoken.

Working Men's Clubs.

TO THE WORKING MEN OF THE UNITED KINGDOM.

THE noble words of Mr. Gladstone, quoted in the prospectus of this Journal, recognise a great truth, and in themselves remarkably confirm it. His must be a cold heart which does not warmly respond to the appeal, coming from all quarters, on behalf of the great industrial population of this country. An earnest desire pervades the wealthier classes to enable the hand-workers of the kingdom to enjoy a larger portion of the various blessings of that civilisation and progress which their toil so mightily promotes, to help them to enter more fully into that rich inheritance of literature, learning, science, and art, which has been accumulated by the genius and wisdom, the faithfulness and self-sacrifice of past and present generations.

The Working Men's Club and Institute Union was formed for the purpose of aiding in this great movement, by arousing the energies of working men, stimulating and helping them to help themselves by the formation of societies for procuring social enjoyment and intellectual improvement, as well as the means of bettering their pecuniary condition. Hitherto they have been entirely dependent upon the public-house as a place of meeting alike for business, amusement, and social intercourse, with very unsatisfactory results. And among all the signs of that brighter era which is now dawning, among all the aids for its realisation, we see none (of course, subordinate to the highest influences and agencies) more hopeful and more efficient than these working men's social clubs and institutes.

In a succeeding number of the WORKING MAN

we propose giving a brief sketch of the origin and nature of these societies. At present we confine ourselves to explaining to the members of our Union, and the public generally, that the proprietors of this Journal have offered to the Council of the Union a certain portion of their space, for communicating to the members and friends of working men's clubs, as well as to the public at large, information, advice, and intelligence respecting those institutions. The Council have accepted this offer, instead of continuing to issue their own periodical—*The Working Men's Club and Institute Magazine*—because they believe that this Journal will give them far greater facilities for communicating their views and information than they could obtain in any other way. They feel warm sympathy with its objects; they have confidence in the spirit and way in which those objects will be sought to be accomplished; and they believe that, by thus co-operating with the proprietors and editor of the WORKING MAN, they will be best carrying out the objects they have in view.

We propose, therefore, to make the WORKING MAN the principal organ of our Union, and we confidently, as well as earnestly, appeal to the members of working men's clubs and institutes, to the members and friends of our society, to all interested in the promotion of working men's clubs, and to all the subscribers to our late magazine, to accept and support this Journal. We ask it not merely for its own merits, considerable as we believe these will be, but specifically also as the principal organ of this important working men's club and institute movement in all parts of the kingdom.

On behalf of the Council of the Working Men's Club and Institute Union, HENRY SOLLY.

150, *Strand, W.C.*

[Mr. Solly's Address to Working Men will appear in our next number, to be followed by the History of the Origin and Growth of Working Men's Clubs.]

The Temperance Question.

IN ITS ECONOMIC ASPECTS.

SOME five-and-thirty years ago the Temperance question was a novelty to the busy multitude. Little was known in this country concerning any of its aspects. It is different now, yet not so different as to make it needless to call attention to some of its more practical and salient features. Our present observations will be limited to its economical phases; and we shall endeavour to strike the golden mean, equally removed from extravagant partisanship and prejudiced opposition. Nothing is eventually gained by exaggeration or undue depreciation. Assuming that the object of the inquirer is the attainment of truth upon this subject, his pursuit of it ought not to be unproductive; for the facts are not scanty, are not far to seek, and are not difficult to interpret. It is our business to set forth these facts in an intelligible form, and the candid reader's business will then be to found his own conclusions upon them.

That the Temperance question has economic aspects we must at the outset take for granted; and it will simplify our inquiry if we first of all consider these aspects as they relate to the individual; next, as they regard the family; and lastly, as they concern the nation—the body politic.

Economy, in its personal relations, is very much the same as the frugality so often mentioned and eulogised by our older writers. Negatively, it involves the avoidance of waste; and, positively, it includes a wise appropriation of one's resources. We are even accustomed to talk of "economising time;" but "economy" and "economical" are terms restricted to the careful husbanding of material means, and the judicious regulation of expenses. Economy might be described under the figure of a triangle, its three sides answering to intrinsic value, market cost, and pecuniary capacity. Economically viewed, every transaction is subject to three inquiries—What is a thing worth? What is its price? What can I spare? If it be worth nothing, or if it be high-priced considering its worth, or if it would cost more than I can afford, though the price does not exceed its worth—in each and all of these cases economy would not sanction its purchase.

The Temperance movement, as every one knows, aims to promote abstinence from alcoholic liquors of all sorts. The reasons assigned for this course are very various; but it is obvious that the economical question can be separately discussed without prejudicing the ultimate verdict. In applying to the purchase of intoxicating drinks our threefold economic test, we have to ascertain their value.

For ages they were popularly classed among articles of food, and were supposed to constitute a diet peculiarly nutritive and strengthening, necessary to health, and contributing to length of days. This estimate of their properties and effects has undergone a very extensive change. Liebig long ago admitted that the nutritive value of the best beer was insignificant; and a century earlier, the young American printer, whose subsequent contributions to social economy added new lustre to the name of Franklin, demonstrated the same truth to his fellow-journeymen, "who," to quote his own words, "wondered to see that the Water-American, as they called me, was stronger than themselves, who drank strong beer. . . I endeavoured to convince my companion at the press that the bodily strength afforded by beer could only be in proportion to the grain or flour of the barley dissolved in the water of which it was made; that there was more flour in a pennyworth of bread; and, therefore, that if he would eat that with a pint of water it would give him more strength than a quart of beer." Scientific analysis confirms this statement, for it shows that in 100 parts of beer the extract or solid matter is not quite equal to 4 parts, while the alcohol forms 5 parts, and the water 91 parts. An imperial gallon of Allsop's pale ale, containing 70,000 grains, showed, on analysis—of water, 63,370 grains; of alcohol, 3,540 grains; of solid matter, 3,090 grains—$\frac{1}{23}$rd part of the whole. So far as nutriment goes, then, it is evident that there can be no economy in paying 2s., or even 1s., for an amount of aliment in the form of beer, which can be obtained for 1d. in the form of bread. The utility of the alcohol contained in intoxicating liquors, by which they are rendered intoxicating, has been warmly contested. Liebig thought that, though not nutritious, alcohol was decomposed, and used inside the body for animal heat; but it was contended, at the time, that such fuel was very expensive, and, therefore, not economical; and more recent experiments have served to prove that alcohol is not decomposed at all, but ejected from the body in the same state as when consumed. It is also urged by Temperance advocates that pure alcohol being a poison, its dilution does not transform, though it modifies its effects; and that the habitual use, even moderately, of beverages containing it must, in the long run, be hurtful to the constitution. To admit this inference is, of course, to strengthen the economical argument against strong drinks, though a concession that strong drinks produce little or no benefit is all that that argument requires. Medical men of the highest eminence have asserted that health and longevity can be secured equally well, or better, without the use of these liquors; and all the ascertained facts in reference to the rate of sickness and mortality among abstainers serve to bear this *dictum* fully out.

It may be argued that bare utility is not what is expected or derived from the use of alcoholic beverages, and that the pleasure they impart is to be taken into account. This plea deserves to be considered (along with the counter-plea of abstainers as to their superior equanimity and general cheerfulness) in weighing the *collective* argument for and against the use of intoxicating drinks; but it is not relevant to the economical branch of the discussion.

The price of fermented and distilled liquors may be compared, on the one hand, with their intrinsic value, and, on the other hand, with the means of the consumer. What is not economical at any price, cannot be economical at the market price; but in calculating the comparative economy of purchases, attention must be paid to the class of articles and the kind of utility we are in quest of. Man is a creature having wants of a physical, mental, moral, and religious nature, and he is under obligation to seek his happiness by the development of his entire being. Strong drink must be classed among articles of consumption; and whether its use is economical must depend in a measure upon its relative utility and cost, compared with the relative utility and cost of other articles of diet. If not a necessary, but a luxury—and such is the decision of leading economists and statesmen—the comparison must lie between it and other luxuries; and the question arises, does it cost more than they, considering their relative prices and utility? It is to be remembered that the price of intoxicating liquors, especially ardent spirits, is artificially and highly raised by revenue imposts; yet this element of expense must be regarded as permanent, since, on moral grounds, Mr. Gladstone and all our fiscal authorities object to any large remission of duty, which would stimulate the consumption of such drinks.

Most needful is it, however, in an economic sense, to compare their value and cost with the means of the purchaser. A rich man is not justified in paying more for an article than it is worth, but his extravagance may exert no sensible effect upon his power of providing for his welfare in every other respect. The same cannot be said of persons with more moderate incomes; still less can it be said of the working myriads of the land. Every anti-economic act tells upon their well-being, by palpably limiting their ability of providing other things of which they stand in need. "Can I spare it? Can I afford it?" is the first question, or, at least, the second, that starts to the lips of a wise man when urged to buy anything, however pleasant, and even plainly useful. He knows, by painful experience, that there are many good things he cannot justly obtain, and a warfare is ever sustained between his desires and the purchasing power of his purse. Intoxicating liquors are not to be had gratis—or, if they are, it is often under circumstances that make them very dear in their results; and the cost of a small daily proportion will, in the course of a year, swell to a goodly sum. We are now looking at the point as appropriate to the individual only, and cannot be accused of excess in naming 6d. per day as a moderate expenditure on all kinds of intoxicating liquors; yet 6d. multiplied by 365 is £9 2s. 6d. per annum. Take even 3d. a day, and the amount is £4 11s. 3d. The average adult expenditure in the United Kingdom lies between these estimates; and among working men and women the proportion cannot be put down lower than £4 11s. 3d. per head. Now, if a person has himself alone to provide for, he is undeniably bound to answer satisfactorily the question whether he can spare several pounds a year for intoxicating liquors? The self-respect which a working man ought to cultivate as studiously as any other man, enjoins upon him the purchase of good clothes, residence in a decent house, familiarity with healthy literature, and a thousand other things, all of them "costing money." There is also provision to be made for times of slackness and sickness, and a shilling at hand for assisting some poorer brother. It is only right that each should ask himself, "Can I obtain all these things, and have as much of them as I ought to have, and yet lay out money on intoxicating drinks?" Liberal men who use liquors are likewise apt to buy them for others in return for similar offers, and to provide them for the visitors they entertain. This much increases the annual cost. Is it venturing too far to state that, in cases without number, a comparatively small expenditure on strong drink is only possible by foregoing personal comforts and means of improvement which should be preferred, on the score of economy, by every reasonable man?

But individual profit is not alone to be consulted. The family tie exists, and economy is a word of profound significance in regard to the family circle.

(To be continued.)

WORKING MEN'S HOUSES IN SCOTLAND.

IT is more than twenty years since attention was first seriously called to the unsatisfactory state of the houses of the working classes in Scotland. At first the matter excited little interest, but gradually, as speeches and pamphlets succeeded each other, all indicating a very unsound state of matters, both in town and country, a decided impression was made on the public mind, and some imperfect measures in the way of remedy proposed and adopted. At length it occurred to a few friends of the cause that the taking of the census of 1861 presented a most favourable opportunity for having the whole reality of the evil ascertained and exhibited. A representation was accordingly made to Sir G. Cornewall Lewis, then Secretary of State for the Home Department, and, after a little difficulty, he consented to have an additional column placed in the census schedules for Scotland, intimating the number of rooms or apartments in every inhabited house, and stating whether the house or room had a

window or not. The men who urged this were anxious that a similar return should have been made for England and Ireland also, but in this they did not succeed. It is to be hoped that when the next census is taken, in 1871, this and other important information will be obtained uniformly for the three kingdoms. Meantime, the result, in regard to Scotland, is curious and instructive. Here is the general outline of it:—

HOUSE ACCOMMODATION IN SCOTLAND.

Rooms without windows	7,964
Houses of one room	226,723
,, two rooms...	246,601
,, three rooms	75,933
,, four rooms	37,186
,, five rooms...	19,910
,, six rooms	15,278
,, seven and more rooms...	37,191
Total houses in Scotland	666,786

From this it appears that, exclusive of the houses or *dens* without windows, there are 226,723 houses of only one apartment, or about one-third of the whole houses of Scotland. Any man of the least intelligence may judge what the social state of the people so accommodated must necessarily be. The sick and the whole, the living and the dead, must thus be huddled together without the possibility of separation; and the feelings and moral perceptions of the young must be blunted from their very earliest years. But this—bad as it is—does not represent the full amount of the evil, for 40,703 of these one-roomed houses have each from *six* to *sixteen* persons residing in them, as will be seen by the following table—

18,983	One-roomed houses have	6	persons in each room.	
11,770	,,	,,	7	,,
5,994	,,	,,	8	,,
2,538	,,	,,	9	,,
936	,,	,,	10	,,
295	,,	,,	11	,,
123	,,	,,	12	,,
40	,,	,,	13	,,
11	,,	,,	14	,,
9	,,	,,	15	,,
4	,,	,,	16	,,
40,703				

The report gives also the details of this in two great cities, setting forth the state of house accommodation in Edinburgh and Glasgow; in both representing a state of matters equally, if not more, unsatisfactory than the general result implies. But into this we do not enter at present. It must be evident to all that such an authentic report of this true state of matters, under the authority of Parliament, is well fitted to alarm all who have the best interests of the population at heart. It must, also, be evident that if it were made universally for Great Britain and Ireland, and repeated at every decade, with the taking of the census, it would enable all not only to judge of the actual social state of the population, but to determine whether this state was improving, or the reverse.

We do not enter at present into the active means which have been employed, and are about to be employed, in Scotland to remedy this great social mischief. This may probably form the subject of future articles. JAMES BEGG, D.D.

The Land of Promise.

"THE throngs of emigrants that crowd to our shores are witnesses of the confidence of all peoples in our permanence. Here is the great land of free labour, where industry is blessed with unexampled rewards, and the bread of the working man is sweetened by the consciousness that the cause of the country 'is his own cause, his own safety, his own dignity.' Here every one enjoys the free use of his faculties, and the choice of activity as a natural right. Here, under the combined influence of a fruitful soil, genial climes, and happy institutions, population has increased fifteen-fold within a century. Here, through the easy development of boundless resources, wealth has increased with two-fold greater rapidity than numbers, so that we have become secure against the financial vicissitudes of other countries, and, alike in business and in opinion, are self-centred and truly independent. Here more and more care is given to provide education for every one born on our soil. Here religion, released from political connection with the civil Government, refuses to subserve the craft of statesmen, and becomes, in its independence, the spiritual life of the people. Here toleration is extended to every opinion, in the quiet certainty that truth needs only a fair field to secure the victory. Here the human mind goes forth unshackled in the pursuit of science, to collect stores of knowledge, and to acquire an ever-increasing mastery over the forces of Nature. Here the national domain is offered and held in millions of separate freeholds, so that our fellow-citizens, beyond the occupants of any other part of the earth, constitute in reality a people. Here exists the Democratic form of Government, and that form of Government, by the confession of European statesmen, 'gives a power of which no other form is capable, because it incorporates every man with the State, and arouses everything that belongs to the soul.'

"Where, in past history, does a parallel exist to the public happiness which is within the reach of the people of the United States. Where, in any part of the globe, can institutions be found so suited to their habits, or so entitled to their love as their own free Constitution? Every one of them, then, in whatever part of the land he has his home, must wish its perpetuity. Who of them will not now acknowledge, in the words of Washington, that 'every step by which the people of the United States have advanced to the character of an independent nation, seems to have been distinguished by some token of Providential agency.' Who will not join with me in the prayer, that the Invisible Hand which has led us through the clouds that gloomed around our path, will so guide us onward to a perfect restoration of fraternal affection, that we of this day may be able to transmit our great inheritance of State Government in all their rights, of the general Government, in its whole constitutional vigour, to our posterity, and they to theirs through countless generations?"—*President Johnson's Message.*

TO MEN.

MEN, the time draws on to action—
Draws, with sternest-voiced demand;
Who would bear its strain and traction
Must be strong in heart and hand.
Who shall grapple double-handed
With it shall have manhood's name;
Who shall falter shall be branded
With unchanging mark of shame.

Toil, oh! Forgeman, damp and sooty,
At the shapes, that one by one
Grow, wherewith the iron duty
Of the season shall be done.
Toil; the time is loud with clamour,
And it striketh palm with thee,
In the ringing of thy hammer,
For the good that is to be.

Speed, oh! Ploughman; let not thistles
Prick out from the loaded wain;
On full many a field there bristles
Crop of steel instead of grain.
Speed; the soldier's orphan children,
Who in mercy shall not see
Where their father's grave is filled in,
Turn their hungry eyes to thee.

Strike, oh! Soldier, once and ever
For the right that grows apace;
Every blow of thine endeavour
Brings a glory to thy face.
It shall be a newer birthright
If the death-bolts hurtle by;
It shall brighten, though the earth-light
Fade before it from thine eye.

Sing, oh! Poet—be thy minor
Holy-sweet to match the wreath
Of the cypress, grown diviner
Now upon the brow of death.
And thy major's revelation—
Let it upward rise and roll
To the heights of aspiration
Of a nation's lifted soul.

Pray, oh! Christian—God is nearer
In the storm than in the sun;
And His will is growing clearer—
Pray His waiting will be done.
Done triumphant, as when Moses
Walked through night and death to see
Far in Sharon's vale the roses
Waiting ages for the free.

Toil, fight, sing, pray, men unshrinking,
With a high, heroic will;
And the good the time is thinking
To the perfect orb shall fill—
Orb of life for feet uplifted,
While calm brows are yet above
In new sunlight round them drifted
By the winds of broader love.

FROM LABOUR—noble, fruitful labour, growing ever nobler—will come forth the grand, sole miracle of Man, whereby Man has risen from the low places of this earth, very literally into Divine heavens. Ploughers, spinners, builders, prophets, poets, kings, Brindleys and Goethes, Odin's and Arkwrights, all martyrs, and noble men and gods, are of one grand host: immeasurable, marching ever forward since the beginnings of the world. The enormous, all-conquering, flame-crowned host, noble every soldier in it, sacred and alone noble. Let him who is not of it hide himself—let him tremble for himself.—*Thomas Carlyle.*

Art and Handicraft.

[The series of articles commenced in our present issue on "Art and Handicraft," is intended to embrace the question of artistic design in its application to the whole circle of art-manufacture and decoration.

The name of the writer will be a sufficient guarantee to the many to whom he is already known as an earnest and successful worker in London, Manchester, and Birmingham, in this field of national education, ever since the first general establishment of Government "Schools of Design," or, as they are now called, "Schools of Art," about 1840.

Regarding the WORKING MAN as a medium by which the writer is most likely to influence the thought of those directly interested in this question, he wishes us to assure our readers of his desire to render this series of articles illustrative of the principles of design as applied to industry as practically useful as possible, alike to the workman and manufacturers as *producers*, and the general public as the national *consumers*.]

I.—INTRODUCTION.

IT would be neither an easy nor a pleasant task to undertake to show the relation which Art bore to Handicraft thirty years ago. Within that period changes of so important a character have been effected in public sentiment, as connected with art in all its phases, that whatever may be the shortcomings in public taste, one thing is perfectly clear—all classes of society profess an interest in the great question of artistic design in some form. Thus, from something like an utter neglect of or inattention to the subject, a strong sentiment in favour of the artistic and the decorative has become the rule instead of the exception. The British artist-painter of pictures gets an amount of encouragement now-a-days which, in 1835, would have been looked upon as something outrageously absurd to calculate upon as likely to arise within a generation; whilst the British art-workman has begun, at least, to take something like an analogous position to his fellow-worker on the Continent, and will undoubtedly do very much more in the same direction, exactly in proportion as he fits himself by an intelligent appreciation of the value of art and art-knowledge, when applied to the ever-varying handicrafts in which beauty of form and decoration plays a prominent part.

It is something to have got a large and growing body of consumers, as forming an important portion of the general public, to recognise the value of sound principles in decorative art; as also to have convinced, very often in spite of themselves, a considerable number of manufacturers that it is to their interest, as well as to their credit, to produce works of an artistic character, in which the decorative adjuncts are so designed as to conform to the principles of good taste, as understood by those who have made it their business to investigate and understand those principles. There can be no doubt that it would be at least of equal importance to embue the workman, by whose handicraft power these works must be produced, with an intelligent apprehension of the "why and wherefore" of the forms or decorative details which he is called upon to produce in this union of art with handicraft. For out of such intelligence must arise a greater interest in the work done, and, with that interest, the development of a spirit in the doing, which cannot fail to act favourably on the result.

Your mere mechanical or machine-like workman will only produce a mechanical result. This, when art comes in as an element, is not favourable to beauty. Whatever shows the mental characteristics of the workman, rises—be the degree ever so remote from what is generally called art, to something like the dignity of art. Without some such mental characteristic it is dead mechanism.

Now, the workmen of the present day have opportunities and facilities afforded them which, at the period above alluded to, had no existence. Hence it was sheer nonsense to seek to mentally interest the workman in art questions without any means being provided by which he could obtain the requisite instruction in practice, necessary to enable him, when called upon, to realise the principles taught in the abstract. No one, however limited his means or humble his condi-

tion, if he has but the will and determination to learn, need be without requisite education in art at the present day.

When the Committee of the House of Commons on Arts and Manufactures reported, in 1836, that it was a necessity of the time that we should look to the future instruction of our artisans in the principles and practice of the arts of design as applied to industry, that committee meant what has followed—slowly perhaps, and often with tortuous steps, or after a roundabout fashion, but still always progressively — that the most ample facilities which circumstances would permit should be provided, in part at least, at the public cost, for the instruction of all who desired to avail themselves of such instruction, and especially the workman, in the practice of the arts of drawing and design in their bearing upon handicraft processes in manufactures.

The day is altogether past for the discussion of the value of this kind of instruction. All whose opinions are worth listening to are agreed that such instruction is one of the most important requirements of the education of the people; and whatever differences of opinion have arisen from time to time, and may possibly continue to arise, as to the best and most direct methods of doing the work, all are pretty well agreed that the true test of the value of the instruction imparted in Schools of Art, and other kindred institutions, is what they effect for the art-industry of the country. This will present itself in two forms: 1. In the *positive* instruction of the artisan, the designer, and the manufacturer, as *producers*. 2. In the *relative* instruction of the public in matters of taste, as *purchasers* and *consumers*. Both are of equal practical importance, and they must go hand in hand together to ensure proper results. In the first category, however, the workman stands as the central figure of the group, and much—nay, almost everything—depends upon the spirit with which he enters upon his work; since from his ranks must arise, in very many instances, both the designers and manufacturers of the future. The more distinct, precise, and, when practicable, *special* the education the workman gets can be made in relation to his wants; and the more intelligently he can be made to see this relation, the more certain and satisfactory will be the result, both individually and nationally. There is great force in directness at all times, and art-education is no exception to the rule.

The question of what and how the general public is to be, or may be taught, scarcely needs more than the simple declaration, that whatever is taught should be taught thoroughly. "Anyhow" will no more do in the case of the general public than in that of the artisan. Perhaps all that need be said on this point in relation to the object in view, can be given under the three heads of—

1. The primary wants of the artisan as *a workman*.

2. The primary wants of the manufacturer as *a director*.

3. The primary wants of the public as *the national consumer*.

My next will deal with the first of these.

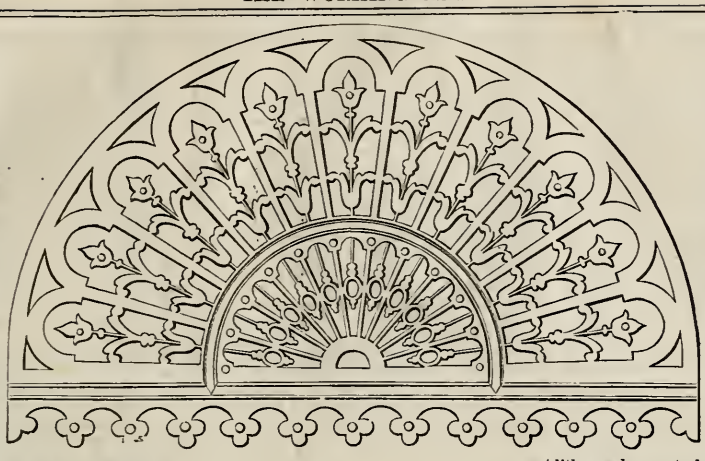
GEORGE WALLIS.

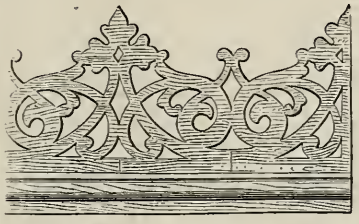
Art Designs

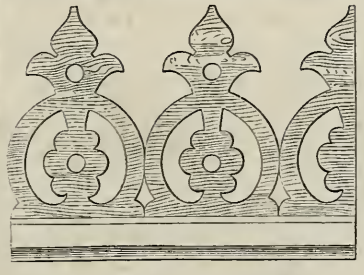
FOR USE IN TRADES AND MANUFACTURES.

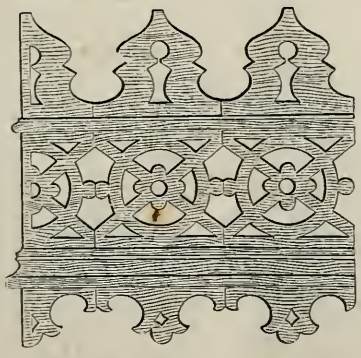
ORNAMENTAL FRETWORK.

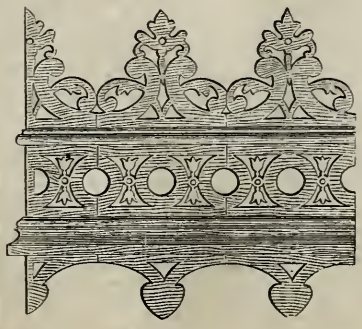
THE neglected and degraded condition in which ornamental art has so long remained in this country has been sufficiently evidenced by the lamentable deficiency of taste observable in many of those departments of industry in which some knowledge of the principles of ornamental art is essential, if anything like an approach to perfection is required to be obtained. Of late years a marked improvement in this respect has been observable. We are paying more attention to the necessity of graceful and appropriate design in even the commonest articles of every-day use. Time was when the possession of taste and refinement was deemed to be exclusively the privilege of the wealthy; but the contents of our working-class industrial exhibitions have clearly demonstrated beyond all cavil, that the love of art has penetrated amongst the industrial community. The artisan is no longer content to have his parlour wall disfigured with coarsely-drawn pictures, gaudily painted in all the colours of the rainbow; or his mantelpiece crowded with miserable-looking cats and dogs "as large as life." He now has his well-executed lithographs or steel engravings in neat, tasteful frames, or groups of wax flowers, or cheap statuettes, with which to decorate his chimney-shelf. This is a sure sign of art progress, but something more is required. We want our working men to carry their newly-acquired tastes more extensively into the workshop, instead of keeping them, as it were, for holiday use. If this were the case, the eye would not continue to be so frequently offended by the absence of taste visible in many of our handicrafts. Yet it is but fair to the artisans to state that the instances in which they are conscious of this deficiency are far from few. The great obstacle in their way seems to be the absence of good and tasteful designs, which might serve both as a guide to what has been done and to what remains to be effected. With the view of assisting, as far as possible, in the attempts of such working men to improve themselves in this direction, we purpose, occasionally, giving ornamental designs for the use of those employed in trades and manufactures. The illustrations in the present number represent specimens of ornamental fretwork, suitable for numerous purposes, whether in wood, stone, or metal. The semicircular design might be used in the upper portion of a gate, window, or section of a verandah. A little taste and ingenuity on the part of the artisan would enable him to modify or vary the designs so as to suit the peculiar purpose for which it is desired to adopt them. The other designs might also be usefully introduced into the woodwork of summer-houses, rustic cottages, and so on, or, on a miniature scale, in the construction of articles of ornament and furniture, according to the taste and skill of the workman.











Carving in Wood.

ONE of the principal lessons derivable from the Working Class Industrial Exhibitions now so numerous in this country, is the ever increasing tendency on the part of many of our artisans to employ their leisure time in a manner much more rational and improving than was heretofore their wont. Instead of thoughtlessly wasting their spare hours in the beer-shop, or in sauntering idly about the streets, they are beginning to take a pleasure in the cultivation of those artistic tastes, the possession of which seldom fails to shed an elevating and refining influence over even the humblest abode. These circumstances are both encouraging and gratifying, for, as Mr. Layard has truly observed, such tastes and the public-house—that terrible bane of the working man—cannot exist together.

With the view of assisting the artisan in the acquirement of a knowledge of the various methods in which his artistic abilities may be turned to practical account, we propose to furnish occasional papers, of an instructive and practical character, concerning those branches of art-industry in which much of the value of the articles produced depends upon the individual taste and skill of the workman.

Our first paper relates to Wood-Carving. The term *carving* is properly applied to works in wood or ivory—carving in stone or marble being termed *sculpture*, and in metal, *chasing*. At one period

the art of wood-carving was extensively practised in this country, the reputation enjoyed by Grinling Gibbons as a wood-carver being extremely great; but until the recent revival of a taste for Gothic architecture, it had dwindled into a state of comparative insignificance. Wood-carving is now largely employed in the decoration of articles of furniture, and affords both a pleasant and profitable means of employing one's leisure time, especially when devoted to the execution of works in relief—a species of carving in which Continental workmen are found to excel.

The tools required by the wood-carver are few and simple. He should commence by procuring a small deal table, standing firmly on four legs, then bore several holes across and along it, and get pegs or long nails to fit into them. Provide also a long, narrow slip of wood, about an inch square, with corresponding holes in it at each end, by means of which the pegs may secure it to the table in any position required. This is to act as a kind of holdfast, to prevent the slipping of the wood to be carved, as it would be not only fatiguing, but exceedingly dangerous, to depend on the left hand for securing it; the pressure of the chisel being considerable at times, and the carver unable to ensure himself from the occasional and unexpected slipping of the instrument in use.

The steel instruments absolutely necessary are nine in number—viz., three *straight chisels*, three *semi-circular gouges*, and three *bayonet chisels*; also, a very fine, sharp penknife, so fixed into a handle as not to close, a soft Turkey stone for sharpening the tools, and, lastly, some fine glass-paper. Diagrams of the gouges and chisels used for carving will be given in next number. At Oxford the bayonet chisels are not shaped exactly like those; they are more gradually curved, but may answer the purpose for which they are designed equally well. These tools can be procured at any of the better class of tool shops, and are inexpensive—costing about ninepence or one shilling each.

It is purely a matter of individual opinion as to whether carved wood-work should be polished, varnished, or left in the rough. If the pattern be delicate, it will not bear polishing, nor can the interstices be reached in this process, while the latter would be choked by ordinary varnish. We can safely recommend the varnish used by bookbinders for leather-work, two or three coats of which, laid on thinly, will brighten and preserve the work, and sink sufficiently to leave the interstices free. In varnishing, it will be found advisable to use two badger's-hair brushes—one flat, and about an inch wide, the other a fine pointed one. The varnish most recommended is styled "Imperial varnish for bookbinders;" but as a difference of opinion prevails on the subject of varnishing, it may be well to suggest the use of the "Swiss walnut dye," to be applied in the same way. A bottle of this costs about one shilling. Varnish may be afterwards applied over the dye, if desired.

(*To be continued.*)

Trades Unions: their Limited Sphere.

THERE never was an invention of the working class for improving their position more natural or more defensible, at the same time more crude and impotent, than Trades Unions. They are the boomerangs of the working class. That peculiar Indian instrument is, as the reader is doubtless aware, a bow so constructed that when jerked through the air it has the uncomfortable property of returning into the face of the ingenious projector who jerked it out, unless he take good care to change his position; and the sharper the jerk and stouter the arm propelling it, the more violently is the propeller struck. We have seen Trades Union Strikes compared to the boomerang. Projected at Capital, they return and strike Labour. Surely this instrument may be improved. If, indeed, this cannot be superseded, some other auxiliary appliances might be called into the field. There is certainly room for a little originality. There would be a great change in public opinion upon Trades Unions, and of the general character of the working class, were these unions to be devoted to objects which affect the honour as well as wages of workmen—their artistic character as well as their personal independence. The "working class" is a formidable term now. The whole body of artisans are coming to the front. Combination among them is at once a sign of intelligence and power. Yet it is wonderful how little they do, compared with what they might accomplish. There are noble, intelligent men among Trades Unionists, but they do not always put themselves forward. They ofttimes give place to ignoble men. They are too modest to be useful. They retire before the noisy. They are afraid of their own order. Modesty itself is a sort of cowardly or criminal thing, when it shrinks from action. Intelligence should be self-asserting where improvement can be effected. The way is open, and the majority of workmen would be rather glad than otherwise to help the wisest to the top and see them uppermost.

The "trade" feeling is all you get now from Trades Unions. They are grossly material without exactly knowing it. They aim as far as they see, but do not see far enough. Unions should have higher, wider, nobler views. The workman should aim to be a thinker and an artist. English workmen have more pride in their work than Scotchmen; but Scotchmen have more pliancy of mind, more industrial ambition, than Englishmen. When a Scotchman has worked in one branch a few months, he aspires to learn another branch. He wants to do, and he will do something else. An English workman will grind files, sharpen needles, drill holes, hammer at an anvil—will do one thing all his days. An Englishman will do one thing tolerably well—a Scotchman will do many indifferently. The Scotchman is more useful, and has many chances of rising to an Englishman's one. Trades Unions do not take into account or care for the workman's character and abilities—only his wages. His power of commanding higher wages might be indefinitely increased in a hundred ways nobler than strikes: albeit, strikes may do duty until better devices are apparent—and it is high time they were.

The workman has had, in modern times, no nobler friend, no wiser adviser, than Mr. John Ruskin. He would make the workman a man, not a tool—a thinker, not a machine—an artist, rather than a mere operative. In a foundry in Birmingham, where more than a hundred men were employed as moulders, carpenters, patternmakers, smiths, fitters, and engine-builders, there were but four artists among them all. Three commanded high wages, because their work was incomparable and indispensable. One, the noblest of them all, was neglected, paid badly, because his employer had no discernment of his value. An old, tall, thin, half-fed smith, was he. He had no wife, only a daughter, who was employed blackleading grates in the same foundry; and when work was over she hurried home to make a fire and prepare the nightly tea for her old father. The sad, gallant old man had honour as well as a true workman's pride in his work. He would always be at the foundry doors before six o'clock in the morning. Before the bell rang he was there. He was never late—never behind time. He never laid down his hammer until after the breakfast or dinner bell rang. He was back at his anvil before it rang again. He would often stay dinner in his shop in order to make himself tools. His tongs were of every variety, forged with exquisite skill. Each was a work of blacksmith's art. There were no such hammers in the whole town as his. He would not work with a bad tool. His tools were the admiration of all the indifferent and inactive workmen in the place, who would borrow them as often as they could—sometimes forget to return them. Never, however, did they try to make similar ones for themselves. The sinewy, shrunken old man was employed in forging and fitting, in blacksmith's not whitesmith's work; but no such work as his was seen in all the town. His oven doors turned on their hinges like intelligent, healthy, willing things. He would not work fast. Paid or not paid, he would not hurry. He worked by the piece, but every piece was perfect after its kind before it left his hands. Mr. Ruskin or Mr. Carlyle would have worshipped the poor, grim, sinewy, melancholy old man, who, however, had the silent joy of a skilled and honest workman. He died with the ring of his own anvil in his ears. He fell down at his work, and spake no more. Of all those fellow-workmen of that period he was the best worth remembering. But no Trades Union thought it worth its while to look after increase of his wages, or had any sympathy with a character like his; yet such workmen, were they multiplied, would soon raise the wages of their department and the character of their own order. That poor old artist of the anvil was better worth public honour than the fattest alderman or the wealthiest mayor, who has nothing but a distended skin or a turgid portmonnaie to recommend him.

Certainly, it would be to the interest of industry that Trades Unions should occupy a wider sphere than they have hitherto done. The order of industry should be the noblest of all orders. The Austrians, in the last century, established an "order of merit"—the "noblest order," says the historian of Frederick the Great, "that the Austrians yet have." Industry is not an order in England. Labour has never yet got beyond a Trades Union. Working Men's Institutes; Industrial Exhibitions, are mainly promoted by the middle and upper classes. They have no distinctive recognition from the trades. Intelligent leaders of industry ought to be foremost in promoting officially these important efforts. Schools of Design, Mechanics' Institutions, Kensington Art Museums, ought to be crowded by the sons and daughters of Trades Unionists. The attention of members of Trade Societies ought to be constantly and officially called to these institutions. Meetings should be held to explain their uses and important advantages to the artisan classes. Tracts ought to be written for circulation among all workmen, inciting them to take advantage of these invaluable opportunities of industrial improvement. Thousands of young men pour into our cities and great manufacturing towns yearly, who know nothing of the means generously provided for their improvement, and their families grow up without ever using these opportunities, which generous and intelligent well-wishers of the working classes devote time and money to create. It is wonderful what a little way Trades Unionists see. We believe it will be useful to endeavour in these pages to increase their horizon of sight. There is a wealth of unused advantages lying around them perfectly amazing.

Men who have Risen from the Ranks.

I.—ABRAHAM LINCOLN.

THE world of the working class is as yet a good deal of a lottery, where the prizes seem few, and to fall by chance. Still, were it wholly so, which is not the case, the working man has the means of winning the prize somewhat in his own hands, and much more so now than formerly; and is likely to have the means under his own control much more in the future than now. Even in a lottery a man, to have a chance at all, must possess a ticket. In the lottery of Labour, Industry is the ticket which gives the best prospect of a prize. Diligence, guided by good sense—which, in this case, signifies foresight and prudence, persistence and a wise self-denial—will always entitle a man to success, and, in most cases, will now secure it. The road from the depths of society to the surface is steep, and requires stout climbing. But in these days resolute men can get up. In worse days, resolute men have reached the surface, and not a few have mounted to prominent places. Great numbers would do it, if they knew well how it has been accomplished by their fellows—if they knew well their own powers, and what it is possible for sagacious and determined men and women to do. The way to rise in the ranks of industry is not so clear as it should be, nor the road so level as it will be. Many deserving men fall by the way, and many, who ultimately succeed in the journey, often faint by the way. But if all knew how to gain strength, and to husband it, and to use it when gained, success would be far more common than it is. The best way to show this is by taking actual examples. What one man can do another can do—what has been done by energetic men with a purpose in them, and not afraid of work, can, as a general rule, be done again by others.

Abraham Lincoln, the late President of the United States of America—a name familiar just now as a "household word"—is an example of a working man who did everything for himself—who, without any advantage of birth or education, climbed up to an unoccupied pinnacle of the world's history.

Far away in Kentucky, in the almost lost regions of Larne, Abraham Lincoln was born in 1809. Quaker blood ran in his veins, and Puritan

names in his family; but no tradition of education or comfort existed in it. Born in an obscure cabin, to an obscure lot, and in a district where education was impossible (had the pecuniary means existed to pay for it), he grew up without any, save that which he could give himself. Young Lincoln had eyes and a brain. He could think and see. We do not mention his ears, because they were of small use to him. There was little or nothing to hear in the wild and nearly uninhabited wilderness where he was brought up—"raised" they say in those parts. But industry, daring thought, patience—these were possible to him, as they are to all. He split rails, but he split them well. He built a flat-bottomed boat, and valiantly guided it down the Mississippi. He had a quick eye and a prompt hand. When wanted he was ready. He lay in the way to be useful.

He learnt to read, and read well whatever he could get to read, which happened to be "Bunyan's Pilgrim's Progress" and "Æsop's Fables," which probably developed that talent for personation and story-telling, which made him so sensible and amusing in after life. A certain thoroughness was with him a characteristic, and an honesty also. A book he had borrowed from Mr. Crawford, his cabin schoolmaster, became damaged by damp. He dried it, but made no attempt to doctor it up and pass it back to the owner, affecting not to know what he had done to it. Concealment, imposition, fraud of any kind, disguise, were alien to his nature. He had a courageous probity. He went straight to Mr. Crawford, told his story, exposed the damage, and proposed to make it good. The arrangement was made that young Abraham was to work three days for the owner, in payment of the book, of which he thenceforth became the worthy, honest, proud proprietor. This integrity was expensive at first, but it was the most profitable investment he or any man could make. Ultimately, it made Abraham Lincoln a king.

Bent upon improvement, he early saw that quarrelling was a waste of temper and time. Looking well around him, he could not help but perceive that differences generally began in ignorance and ended in folly or crime. A little observation showed him that the fund of ready-made illustrious in the world was very great, and there was no need to increase it. Discord had plenty of friends, even in the backwoods, and he would not be one of them. And he was distinguished, when a mere youth, as a "peace-maker." Without learning, without money, by valiant, thoughtful self-education, he found out the secret of being sagacious and useful. He acquired pacific power and local repute.

Rough customers floated down the Mississippi about 1830. Peace-making on those waters was no horticultural vocation, nor was the employment of a boatman an inviting one. It had its cares and dangers. To guide and propel a crazy boat, in all weathers, down 2,000 miles of water; to lie at night with no covering but a blanket; on no bed but the deck of the boat; to spend months and years in this way, was not a condition of things under which men acquire knowledge or improve their minds. But those who have minds to cultivate, can anywhere in this open world cultivate them.

To get a diploma from a college, if there are colleges in your part of the world, and you are able to belong to them, is all very well; but, failing that, a diploma obtained from a man's neighbours and associates will go a long way, and not be without honour. Already our Mississippi hero was known as "Honest Abe;" and when the Black Hawk war broke out, he was chosen by his neighbours as their captain. For scorning danger, or defying fatigue, he had no superior in those uncomfortable parts. Captain Lincoln was astonished at his selection—at the respect shown to him. He had played a simple, manly part; he had done his duty thoroughly in his sphere, and did not know that that was a remarkable thing. He, however, was never prouder of any distinction he achieved than of this. It was his virgin honour.

He was started on his return from the war for legislatorial service. Beaten there, he quietly turned to shopkeeping, uniting with it the function of village postmaster. But here came in those inexorable laws of supply and demand, of which the Black Hawk captain had heard of only in a dim way, but which act all the same whether heard of, or understood, or not. In backwoods, as well as in great cities, social science is all the same; and there was demand at Postmaster Lincoln's store, but no supply, or a very inadequate one. The storekeeper was deficient in capital; and as no profit could be made where no transactions took place, our adventurous storekeeper vanished from that particular class of merchants; albeit to reappear in an unlooked-for quarter.

A rough and disagreeable duty appeared necessary to be done by our unfortunate postmaster. The neighbourhood was infested by a pugilistic nuisance, one "Billy Bowlegs." Bumptious Billy was a bully and terror to a decent people of flaccid muscles. The Black Hawk captain took the disagreeable knave in hand, and, to use the language of the ring, "polished him off." The turbulent terror got his quietus, decent people had peace ever after, and Lincoln acquired fame as a practical pacificator. But his own taste lay in thoughtful things, and he applied himself to the study of the law. Purchasing a few books, he mastered them. Fortunately removed from temptations to desultoriness, and taught by his own good sense that concentration of attention was the sole means of mastery, he became a shrewd, sensible backwoods attorney. Knowing that evidence was the instrument of justice, he learned to make sure of that; and to be sure of that, his natural sagacity told him that he must take nothing for granted. It occurred, in what may be called his prairie practice, that the son of a Mrs. Armstrong, a mistress in whose service Lincoln had formerly been, had got mixed up in a fray in which a man was murdered; and young Armstrong lay in gaol, under charge of having committed the murder. As the youth's mother had been a kind mistress to young Lincoln when in her service, he volunteered to defend her son. Finding that the chief witness deposed that he identified the alleged murderer, because he plainly saw his face as he struck the blow, Mr. Lincoln asked "how he could see his face at night?" The reply was that "the moon was shining clearly at the time, and fell upon the murderer's face." Mr. Lincoln had no evidence which enabled him to question this allegation; but he proceeded to inquire whether it was a fact. To test it, he consulted the meteorological almanack of the time, when he found that on the date of the murder the moon did not rise in those parts at all until half an hour after the time when the witness swore it was shining clearly. This evidence, therefore, was pure moonshine of the wrong kind. This Mr. Lincoln explained to the jury, and the young man was acquitted; and the thoughtful, fact-sifting attorney had the satisfaction of showing his gratitude to his early benefactress, by presenting her with the life of her son.

In 1834, Mr. Lincoln was successfully landed in the local legislature of his district; and in 1847 in Congress, as member for Illinois; and twenty-three years later he was elected President of the American nation. Throughout his career his character was like his handwriting—legible and simple: the down-strokes bold, the up-strokes clear. He disliked that style of calligraphy which was too ornamental to be read. He, manifestly, had the manly taste which holds that character, like the handwriting, is all the better when it can be easily made out.

Quite unknown to Europe when he appeared unexpectedly at the top of American society, his past life was naturally scrutinised; but Mr. Lincoln always, whenever and wherever the biographical examiner lights upon him in the past, turns up a wholesome, kindly-natured, sagacious, honest man. No baseness, no evasion of duty, no *finesse*, no supineness as to duty, ever appears. He played his part in politics in the spirit of a true workman. He gave himself to his task, and executed it well. He possessed or acquired that one quality which transmutes a savage who has it into a gentleman—that of constant consideration for the feelings of others. He gave no pain that he could possibly avoid, even in doing necessary things. His honesty, his studiousness, his legalness, walking by rules where rules were laid down, his patience, humorousness, and fixedness of purpose, all indicate a man who had used his leisure to become master of himself, before he became master of others.

These were the qualities which enabled a rail-splitter of Decatur, of buckskin attire and a racoonskin cap, to find his way to the head of the State. When he was elected President, his friends tore up the rails round his father's house, the first Lincoln split, and carried them in triumph and honour before him from State to State. He was a child of toil, and in America "labour is sacred," and no man is ashamed of it. It was a working man who had become king. But the lithe giant of the Sangamon River, for Abraham Lincoln was six feet four inches high—the tallest man who ever attained the highest political eminence—would never have left the name he did in the world but for those personal qualities, which he took more trouble than most workmen to cultivate. He had the sense to see that it was not the amount of information, but the sureness of a man's knowledge, that gave him real power. In political debate he would not rest content with consulting dictionaries for the meaning men ought to attach to their terms—his rule was to ask the men themselves what sense they attached to their words. His genius lay in the use of his eyes. He understood the art of looking round him—round his feet before he stepped, as one begins life in a twilight—round his chair before he moved it, lest he placed it before others—round an idea before he adopted it, to see what it meant—round his speech before he spoke, to be sure that it was necessary and to the purpose—round an act before he did it, that he might not have to undo it or regret it afterwards—round his friends before he accepted them or changed them—round a servant before he dismissed him—round an offence before he punished it, that he might do no unjust thing—round the law before he consented to supersede it by an exercise of supreme and dangerous authority.

The bullet of the assassin might destroy the life, but it could not touch the fame, nor destroy the splendour of his example. The world will believe of his life, as Mr. Disraeli, with equal grace and genius, said in the House of Commons of his death—"In the character of the victim, and in the accessories of his almost latest moments, there is something so homely and so innocent, that it takes the subject, as it were, out of the pomp of history and the ceremonial of diplomacy—it touches the heart of nations, and appeals to the sentiments of mankind."

SIXPENCE UNDER MY THUMB.

SIXPENCE under my thumb, my boys,
And a wife that's trim and clean;
With a cheery word, and a will to work,
And a kiss, mayhap, between.
A good tight roof, and a bit of meat,
A faggot behind the door;
Come what will, we'll never complain,
Because—we want no more.

Sixpence under my thumb, my boys,
And never a debt to fear;
A little store for a rainy day,
And a door that no wolf comes near;
A good strong arm, and a bright fireside,
And then, as I said before,
Come what will, we'll never complain,
Because—we want no more. G. E. M.

ITEMS OF INTEREST.

WORKMEN FOR JAPAN.—About sixty skilled workmen, of various trades, have just been engaged by the Japanese Ambassadors, now at Brest, to accompany them to the East, at very liberal wages.

STEAMERS IN THE PACIFIC TRADE.—Eighteen monster steamers leave or arrive at Colon, on the eastern side of the Isthmus of Panama, every month. These steamers are connected with Southampton, Liverpool, France, and the United States. Sixteen monster steamers leave or arrive at Panama, on the western side of the isthmus, every month. These steamers belong to English and American mail-packet companies and the Panama Railroad Company.

LOCOMOTIVE BUILDING IN CALIFORNIA.—The first locomotive ever built in California has just made its trial trip on the San Francisco and San Jose Railroad. The cylinders of this locomotive are 18 in. in diameter, with a 24-in. stroke; the driving wheels, 5 ft. in diameter; length of locomotive, 26½ ft. over frame; diameter of boiler, 44 in., containing 141 2-in. tubes 11 ft. in length; total weight of locomotive, 30 tons. The locomotive drew four cars, containing 300 invited guests; and on the return trip, made two miles in 108 seconds, the best time yet accomplished on that side of the Rocky Mountains.

A PRACTICAL JURY.—At an industrial exhibition, recently held at Vienne (Isère), a variety of artificial legs, constructed on an entirely new principle, were exposed to view. The jurymen, whose duty it was to decide on the comparative merits of the instruments, were much perplexed. At last they bethought them of assembling half-a-dozen Crimean and Mexican *amputés*, and starting them over a half-mile course equipped with the rival legs. The prize is stated to have been won by an *invalide*, both of whose legs had been taken off at the knee, but who, nevertheless, went over the distance in nine minutes.

"ALL LABOUR IS SACRED."—*Carlyle.*

THE WORKING MAN.

JANUARY 6, 1866.

TO OUR READERS.

THERE is an old-established custom, which has more than antiquity to recommend it, that, when a new periodical makes its entrance into literary life, it should declare its principles, and announce its programme. We feel no disposition, in ushering the WORKING MAN into the world of journalism, to depart from this ancient and wholesome usage. On the contrary, we consider that there is no publication with reference to which such an explanation is so imperatively necessary, as one which undertakes to deal with questions peculiarly affecting the Working Classes. On no subject has more misunderstanding prevailed between those who wrote and spoke and those for whose benefit what they wrote and spoke was intended. It is greatly to be feared that many efforts, made with the best intentions, to solve the difficult problems which the condition of the Working Man presents, have not only failed signally in their benevolent purpose, but have served more desperately to complicate these problems, by inadvertently and unconsciously wounding feelings which it was sought to soothe, embittering animosities which it was sought to allay, and confirming prejudices which it was sought to remove. It is therefore essential that the conductors of the WORKING MAN should make a full and explicit statement of the objects they have in view, and the means they propose to employ for their attainment.

The title of our Publication speaks for itself, and forms a brief but complete index to its contents. Whatever concerns the interest of the Working Man—using the term in its widest sense, as including not only working *men*, but working *women*, and working *children*—will fall appropriately within our sphere. The rights of the Working Man and his duties; the relations of employer and employed; the Trade Union, and the Masters' Association; the strike, and the lock-out; the rate of wages, and the hours of labour; the Co-operative Society, the Benefit Society, the Temperance Society, and the Working Men's Exhibition; the education of the labouring classes; their diet; their sanitary condition; their dwellings; their employments; their recreations: these, and all other kindred topics, will demand and receive our attention. A glance through the following pages will show that a portion of our space will also be devoted to other subjects of interest; but our main business will be with those above enumerated. We hope, therefore, that the Working Man will find in our columns advice in difficulty, and information in doubt; warning in danger, and encouragement in trial.

Such then is the task we have proposed to ourselves. To enlarge either on its importance or its difficulty would be superfluous. Accordingly, we proceed at once to indicate the means which we purpose employing in order to carry it out.

In our opinion, one of the chief causes of the failure of so many efforts to deal satisfactorily with the questions which we propose to discuss, lies in the fact that they have in general been made by persons belonging exclusively either to the class called *practical*, or to the class called *theoretical* men. Hitherto these two classes have lived and worked in a state, so to speak, of estrangement, deriving from each other no assistance in the pursuit of their common object. The philosopher, in the solitude of his study, worked out problems regarding the labouring classes to a solution satisfactory to his own mind, and correct so far as the facts on which he based his reasonings went. But, strangely unmindful of the incompleteness of his *data*, he claimed for his conclusions a universality of application to which they were not entitled; and, attributing the ill reception with which his theories met to ignorance, stupidity, or prejudice, refused even to listen to the objections which the Working Man, practically acquainted with the circumstances of his own case, brought against their truth. The labouring classes, thus condemned unheard, imbibed a deep distrust of all abstract speculation on their condition and the means of bettering it. They therefore set about working out experiments on the subject for themselves, and framing upon them theories of their own—theories which contained many important elements of truth, but which might naturally be expected to be deficient in breadth of view.

There is, indeed, a third class whose speculations on such subjects have been simply mischievous—a class of persons who, without either theoretical or practical knowledge to guide them, rashly broached opinions for which they had no better foundation than a superficial acquaintance with a few of the general principles of political economy, the mere enunciation of which, they seemed to think, would act as a sort of charm, and dispel the troublesome doubts and difficulties which they were unable either to understand or solve. The interference of these ignorant and presumptuous pretenders has been resented as an impertinence by the working classes, and has rendered the latter much less accessible to the views put forward by really thoughtful men.

What course, then, do we propose to take? Our method will be this: We shall not lecture the working classes from a platform raised on an assumption of higher wisdom or greater knowledge—nor, we may add in parenthesis, shall we preach to them from a pulpit elevated on an assumption of superior virtue or benevolence. It will be in no narrow spirit of dogmatism that we shall approach the consideration of the vast and difficult problems which we shall be called on to solve—problems so vast and so difficult that, were we not persuaded of the usefulness of an honest, even though unsuccessful, attempt to grapple with them, we might well shrink from the task. We shall not be ready with any of the cut-and-dry formulæ of political economy, with which to dispose summarily of the cases that from time to time come up for decision. But, on the other hand, we do not intend to fall back upon untutored common sense when we find ourselves in difficulty. We hope we have too just a conception of the inherent defects of the social sciences, and, at the same time, too just an appreciation of their merits, either to apply their rules with a procrustean pedantry, or to discard them as being in practice altogether useless. We wish to teach; but that we may do so effectively, we are willing to learn. We are desirous of working *for* the Working Man; but that we may do so efficiently, we are anxious to work *with* him. We propose, therefore, to call the experience of practical to the aid of scientific men. We hope that our Journal will form a common ground upon which the Working Man, with his intimate knowledge of the wants and aspirations of his class, may meet the statesman and the philosopher, who are seeking an opportunity to aid him to satisfy the one and realise the other. Already the assistance of many eminent thinkers, known friends of the working classes—men whose writings have shed a lustre on the literature of their country—has been promised to us in our arduous undertaking. It now only remains for the Working Men to do their part. We heartily invite and earnestly solicit their co-operation. So far as our space will admit, we shall always be glad to give a place in our columns to every honest and temperate expression of opinion, every item of information, and every suggestion, on matters affecting the welfare of the labouring classes, which shall be communicated to us by any person interested in the subject. The WORKING MAN will thus become a repository for the thoughts of those who, by genius, education, or experience, are best qualified to discuss the great questions which we shall have to consider, and for the facts on which alone a sound judgment on such questions can be formed.

And since the Working Man may also be considered as a possible Capitalist, not a few of them having already become so, by aid of their Self-help Associations; and even Landowner on a small scale, through the means of Land Societies; and also as an Employer, as Co-operative Manufacturing Societies * are making him—we shall necessarily have to treat of questions interesting to the Capitalist in the lower field of his operations, to the Director of Labour, to the Thinker who works with his brain, and marks out the path of the hand-worker, as well as the Worker himself. Indeed, the Consumer may be conceived as interested in the operations of Producers, a knowledge of which must be an important and intelligent element in determining his outlays.

There is, therefore, a wide field, in which we trust the WORKING MAN will find readers; and as we suppose it is possible to treat the subjects discussed in a readable manner, we hope our pages will be found to blend recreation with instruction.

Right Hon. William Ewart Gladstone, M.P.

FEW Englishmen in modern times have possessed so large a share of working-class esteem and confidence as that enjoyed by William Ewart Gladstone, who, during his thirty-three years of hard-working public life, has repeatedly shown himself to be one of the truest and most faithful friends that the industrial community have ever possessed; his leading measures being framed with the primary aim of promoting—so far as it is possible for legislative action to do so—the moral, intellectual, and social welfare of the toiling myriads, to whose ceaseless industry this country is principally indebted for its present unparalleled amount of wealth, greatness, and power.

Mr. Gladstone is one of the true representative men of the nineteenth century. The son of a wealthy and successful Liverpool merchant, he found himself aided at the commencement of what has proved such a brilliant public career, less by the possession of a title, origin, and connections, than by his successful university career, business-like habits, unblemished reputation, and intimacy with the mercantile world. Unfavourable, at first, to the progress of working-class power in the state, he joined his fortunes with those of the Conservative interest, and entered the reformed House of Commons, in 1832, as member for Newark. But although he sat on the benches opposite to those occupied by the popular

* The subject of Co-operation will be treated in the next number of the WORKING MAN.

party, he speedily gave evidence of the possession of an impartial and inquiring mind, which, like that of his great leader—the late Sir Robert Peel—learned to act on his own convictions, rather than upon those of party.

When Sir Robert Peel brought forward his celebrated free trade measures, he found Mr. Gladstone one of the most earnest and active of all his supporters; and when, amongst the tears and lamentations of a people to whose homes he had brought the inestimable blessings of cheap bread, Sir Robert Peel died, William Ewart Gladstone took up the sword of his departed chief, and prepared to fight anew the battle of free trade which had been so auspiciously commenced. From that time, Mr. Gladstone began casting off, one by one, the party shackles which had hitherto restrained the full exercise of his magnificent energies, and identified himself more and more with the progress of the great Liberal body, to whose exertions the working classes of this country are so largely indebted. As he progressed in political experience, the distrust originally felt by Mr. Gladstone towards the working classes gradually melted away, to be replaced by a frank and unreserved confidence in the earnest love of self-help, and steady upward progress, which they have so often displayed. Brought by the force of circumstances, perhaps, more than any other modern statesman, into direct contact with working men—the very pith and marrow of the industrial classes—he has learnt the large amount of kindly feeling, honesty, and loyalty, hidden beneath their rough, plain-spoken exteriors; and, possessed of this knowledge, he has also learnt to admire and respect the men who with their hands work as hard, if not harder, than himself with his brain, to promote the strength, power, and glory of their common land. The working classes know Mr. Gladstone, and he knows them; and in this intimacy between the two, this mutual desire to assist in each other's aims and aspirations, may be traced the germs of that time when class shall cease to war with class, and rich and poor, peer and workman, squire and peasant, shall labour lovingly and ceaselessly with each other in carrying out the great principle of social progress: *the Greatest Happiness of the Greatest Number.*

RIGHT HON. W. E. GLADSTONE, M.P.

The Story of a Wood-Carver at St. Paul's.

THE following is a copy of a manuscript preserved in the British Museum. It is a letter written by an ingenious country lad, Philip Wood, from London, in 1699, to his "sweet mistress, Hannah Haybittle," only daughter of Ralph Haybittle, at Sudbury, describing the means he adopted to procure employment as a carver at the works in St. Paul's Cathedral, then erecting by Sir Christopher Wren, and runs thus:—

No. 9, Ivy Lane, London,
September 3, 1699.

Dearest Hannah, my sweet Mistress,—Pray God that this may find my own sweet hearte and lyfe well. I hope that James Herbert put into your hands one letter which I sent. I gave him the letter myself, and he promised most faithfullie to find occasion to conveye it to you. I know, my dear Hannah, you think it both hard and wrong to hide anything from the knowledge of so kind a father as yours. The waggon returns into London on Tuesday, so I went to the yard in Bishopsgate, and waited for it to arrive. At last I heard the bells; and Jim Herbert, as he turned under the gateway, smiled at me pleasantlie, and he said, "Wait a bit, young chap, I have somewhat to say to thee." After a while he came to me, and told me how he met you walking on the croft, with your maid Susan, and how he contrived to give you my packet unseen of her. To think of such craft under a waggoner his frock! But no letter from you. He says that you looked well, and seemed happy to receive my letter, and I am contente. But had you no opportunitie to write one line? I know how it is, dear Hannah; you dislike any artifice. Indeed, it is hardly right for me, who owe so much to your good father, even the abilitie to write this, as he sent me, a poor orphan, to the free school,—to tempt you in this matter.

I can no longer put off telling you the good news. God has, indeed, been good to us. Little did I expect such happiness when I left Sudbury last May. That morning, when I looked for the last time from the hill, I thought my hearte would surely burst, and at one moment I was inclined to turn back; but then came to my mind what kind neigbbour Smith should say she heard your father say about London; so I plucked up courage, and walked very fast over the Tye. Dear Hannah, it is a very sad lyfe to be alone in a great city. At Sudbury, I did contrive to see you, though at a distance, every day; and I could walk in the pleasaunt fields, and think about you, and read Master Shakspear his plays which you gave me, and which trulie have been, latterlie, with my Bible, my onlie comforte. In the evening I could pass your house to catch a glimpse of your shadowe on your casement, or to hear your spinnet sounding; and sometimes I found the neighbours showing the carvings to a farmer or two who had been at the market; and it was sweete to my poor vain heart to hear them tell how the rich merchant, Master Haybittle, retired from London to his native town, and bought a house, and employed a poor young man who showed some taste for such matters, to carve upon the woodwork, elephants and lions, and other wonderful beasts from the distant lands where he used to send merchandise. Then all said the carver must go up to London, and become a great man.

Well, I got to London, but no one would employ me, and my little pittance of money got lower and lower; and I used, for want of employment, to go to the Churchyard of St. Paul, and watch the building, which will certainlie be one of the wonders of the world. Suddenly it struck me one day, that they would surlie put into such a grand building, carvings, such as I have often seen at Melford and the other churches; and I spoke humblie to the foreman, but they repulsed me, saying, "We want no hedge-carpenters here." Nevertheless, I went day after day to look on at a distance; and a week yesterday, as I stood as usual, in great admiration, a gentleman approached, with papers in his hand, and he talked with the workpeople; and at last his eye fell on me, and he said to the foreman, "What does that young man want? I will not have any person about here unless they have business." And the foreman answered, "Please you, Sir Christopher, he is a country fellow, who troubles us to give him some of the carving work to do." On this the gentleman, who I then knew to be the great architect, beckoned me towards him, and said, "Friend, you want carving work. What have you been used to carve?" Hannah! indeed you will hardly credit it, but I was so confused that, forgetting all but what I earned my bread by whilst I was in the country, I answered, stammeringlie, "Please, your Worship, Sir Christopher, I have been used to carve troughs." "Troughs," said he, "then carve me, as a specimen of your skill, a sow and pigs; it will be something in your line; and bring it to me this day week. I shall be here." On which he went away smiling, and all the foremen and workpeople burst into loud laughter.

I do not know how I reached my lodgings, but when I did I throwed myself on the bed, and shed bitter tears, and reproached myself for losing such an opportunitie of explaining what I had done on your father his house.

In the evening the good Quaker woman, whose back-garret I rent, came up-stairs, and, entering my room, said, "Friend Philip, I have not seen thee since morning; I feared thou were ill; see, I have brought thee some broth." But I could not touch it; so she said, "Tell me, I pray thee, thy trouble; it may be I can help thee." So I told her, and she said, "Thou art wrong, for if the man who is building that great steeple-house requires such and such a thing done, why, if thou really hast skill, it will be showed as well in that as in any other matter."

Her words were comforting to me, and I sat up on the bed, and ate the broth; and then I took my last guinea, and I went out and bought a block of pear-tree wood, and worked at my task continually; and yesterday morning I dressed myself in my best, and wrapping it in an apron, borrowed from my landlady, I went to the building. The workpeople jeered me, and pressed very much that I should show it to them, but on no account would I do so. I waited two or three hours, and then it was rumoured that Sir Christopher Wren was arrived with a party of the quality, to whom he was showing the building. At last he and the rest passed where I stood, but when I would have gone forward to speak with him, the foreman and others would have hindered me, saying, "This is not the proper time; you may see that Sir Christopher is otherwise engaged." But necessity made me then bolder, and I said, "He himself appointed me this morning," and I pressed through them. Directly his eye caught me, he beckoned, and I went towards him, and I bowed and undid the apron, and presented the carving to him. For a minute he held it in his hand—Oh! deare Hannah! what an anxious minute! and then said, "I engage you, young man; attend at my office to-morrow forenoon." Then he walked on with the party, still holding the sow and pigs in his hand; but when he got a little distance, he turned round and said, "Wait until we pass back." So I waited; and when they returned, Sir Christopher came up to me, and said, "Mr. Addison" (I think he said "Addison" or "Addington") wishes to keep your carving, and requests me to give you ten guineas for it." I bowed, and then he said, "I fear I did you some injustice, young man; but a great national work is entrusted to my care, and it is my solemn duty to mind that no part of the work falls into inefficient hands. Mind and attend me to-morrow." So I bowed, and ran home, and my kind landlady was also overjoyed.

This morning I have been at the office, and I am indeed engaged to do carving in this most wonderful building.

I leave at your discretion to acquaint your father of this matter, and if you would write to me only one line, it would increase the happiness of, Dear Hannah, your faithful servante untill deathe, PHILIP WOOD.

It is added,

The following notice of Philip's further career appears in the Report of the Commissioners of Public Works, respecting the building of St. Paul's Cathedral.

Philip Haybittle, subpoened from Sudbury, Suffolk,

deposed that he received certain sums of large amount as per receipts, given during the years 1701-2-3-4-5-6-7, for carved work in the Cathedral Church of Saint Paul. On inquiry from their honours the Commissioners, respecting the difference betwixt his name and the name on the various receipts, the said Philip Haybittle deposed, that he married Hannah, only daughter of Ralph Haybittle, some time a merchant in Cheapside, and by the terms of the will of his said father-in-law, he was obliged to change his name.

What We did with Ourselves on Boxing Day.

WE who work hard, and generally find that we have quite enough to do with our time and our money, do not have many holidays. Five or six a year—Good Friday, Easter Monday, Whit Monday, perhaps a couple of days at odd times, just to take our wives and little ones out to have a peep at the green fields, and Boxing Day, are about all we indulge in. A holiday is not worth having unless there is a satisfaction in it which lasts the week out; and it is poor work to lose a Monday in dawdling about, and best part of the Tuesday because we are mad with ourselves for what we did the day before, and then be looking forward all the rest of the week to a short Saturday night. But when we have earned a holiday, we enjoy it like we do our Sunday's dinner, knowing that the leg of mutton and batter-pudding are paid for, and are fairly our own; and enjoy it in the same fashion, too, with our smiling wives and merry boys and girls to share it with us, and no headache afterwards.

It is natural to suppose that there always will be two sorts of people in the world—those who make the best of things, and those who make the worst of them. At any rate, some men who are not very clever at anything else show a wonderful deal of ingenuity in making a holiday about as great an injury to themselves and as great a nuisance to others as possible; while, on the other hand, there are those who contrive to make it just that sort of day which one would be disposed to put a mark against in the almanack, so that it might be called to mind as a really happy day.

Now, on Boxing Day, for instance, there was very little business done anywhere. In the London streets there were nearly as many shops closed as were open, partly because tradesmen knew that, if they kept behind the counter, their chief occupation would be to tell dirty little boys, who teased for Christmas-boxes, to "get out before they were turned out," and partly because the shopkeepers wanted a holiday for themselves. Some of our men made up their minds to enjoy themselves thoroughly in a respectable sort of fashion. They would go to the British Museum, or the Zoological Gardens—show the children the stuffed hippopotamus and the gorilla, the light humming birds and the birds of paradise with the wonderful tails, and those great stone statues which came from Egypt and Assyria, and were the very things they had been reading about at school on Sunday; or, in the gardens in the Regent's Park, to see the funny monkeys catch hold of each other's tails, the tigers and hyenas walk backwards and forwards in their dens, and the seal jump out from his little pond to catch pieces of bread. After that we would go to the National Gallery, or the South Kensington Museum. Most of us preferred the latter, because the pictures seemed a little too grand for us. We know they are very clever, and cost a great deal of money; and here and there a sweet face of a woman or child peep out at us from the canvas, and the eyes seem to say, "There is more in art to make men better and wiser, than you think of, till you have opened your minds a little more to its teachings;" or a quiet little bit of landscape, with the sun beaming in long lines of light through the twisted branches of old trees, and giving a sort of golden tinge to grass and flowers, and cows knee-deep in winding streams, that make us think, "You, too, are a working man, Mr. Painter, and your work is durable too, though neither of wood nor iron, for you have somehow preserved the face of nature as it appeared to us when we were very little children, and things looked more beautiful than they do now."

But most of us, as we said, liked Kensington best. There are pictures there too, and capital ones they are. We did laugh at some of Webster's, and Leslie's, and Frith's; almost fell in love with the graceful girl so anxious about the colour of her wedding gown; and as for Turner, it seemed as if, after he had painted the portrait of Phœbus Apollo slaying the Python, he had made him captive, and employed him to mix his colours for his later works, so full are they of sunlight, till at last poor Turner seemed to be dazzled with excess of light, and to have floated into darkness with the red sun blazing behind him, like his own "Temeraire." But the models, the ships, and the machinery, and the astronomical instruments, and the old carved furniture, and the glass and porcelain, and the beautiful textile fabrics, and the school-books and maps, pleased us most. How the boys did admire the men of war and the frigates! and how we did all enjoy the rest in the refreshment-room, and the buns, and the sandwiches, and the ginger-beer, and the sparkling lemonade, which, as it was holiday-time, we thought ourselves entitled to indulge in!

The word "we" has a double meaning. It stands for our own particular party, and also for our class generally. While some of us—that is, many thousands—tried to learn a little while we amused ourselves, and explain to one another what was the ultimate use and value of each one's special handiwork, and show, for instance, how the great engines among which we had been toiling all the year were fitted into their places, and what they had to do when they were there, there were, it is sad to say, thousands more who seemed to think that the whole use and value of a holiday was that it gave an excuse for getting drunk—for wandering about from one publichouse to another; for "standing drains" and "having pints;" for crowding and squeezing in at narrow doors, among dirty, quarrelsome, unwholesome sorts of people, who wrangled, and jangled, and smoked, and gulped down unnecessary and most hurtful drams, and said "Come, now, old fellow, since you have stood your pint, I'll stand mine—shall it be cooper or old ale? or, I say, old fellow, have a drop of rum or something?" And then they tumbled out, and said, "Come along, old woman! 'Slap! bang! here we are again!' Boxing Day only comes once a year, missus; and what do you say to two pen-n'orth on the strength of it?"

More than forty thousand of us went to the Crystal Palace; and a great many of us generally do go there whenever we take a holiday. Sometimes we go in vans, and wear green scarfs, and carry wands and flags, which do not at all hinder us running up and down the slopes, and having a jolly good game in the grounds till the fountains begin to play, and we leave off to look at them. But that is in the summer; and now, on Boxing Day, it is cold and damp out of doors, so we keep under the glass roof, and there we find plenty to amuse us. The shrubs, and the hanging baskets, and the statues, the Pompeian Court—rather cold-looking to-day—and the glittering Alhambra Court, the fountains and the fish, the big Egyptian giants and the Assyrian bulls, are all there; but there are other attractions, too, which draw thousands to look at them.

But how did we get to the Crystal Palace, and how did we get back again? Several of the railway companies undertook to arrange that matter for us, and in some respects a pretty mess they made of it. We learned elementary arithmetic at school, and many of us have got a little way farther by this time; but it does not require decimals or logarithms to work the simple sum, which seemed to be too much for railway managers on Boxing Day: if one carriage can hold so many, how many carriages will be required to take a certain number? That seems to be easy enough, but it could not be managed on that particular day. Perhaps Christmas-time is not favourable to arithmetic; but if our wives had made the puddings a great deal too big for the saucepans, we should have thought they ought to have known better. Yet that is just what was done at the railway station. The crowds on the platform were the puddings, and the trains were the pots, which could not hold more than half of the number who had paid for tickets. It was no use saying politely, "Please, don't push!" or unpolitely, "Now, then, stupid! keep off my toes, can't you!" Everybody pushed and fought their way into the carriages, and when the train was at last started, there were two or three hundred disappointed people left behind.

But we got to the Palace at last, and we got home again, though rather too late to be comfortable, seeing that work began again the next morning, and that if there is one thing more than another that spoils a holiday, it is feeling the next day that, instead of refreshing us, it has made us less willing to set to work as we ought to do.

The theatres were crowded, as they always are, on Boxing Night. Very wonderful is the skill of scene-painters and stage-managers, and many of the set scenes are marvellously beautiful. Very few of the audience can form any idea of the vast amount of applied science and mechanical skill and contrivance brought into play to produce the brilliant effects so much sought after in pantomimes. But many working men do not like theatres, and they have good reason for the objections they take. As to the music halls, with their mixture of slang, comic songs, good music, tumbling, and gin-and-water enjoyment, why, we, at least, think that they are better avoided on Boxing or any other night. So many of our shepmates, we are glad to say, finish their day's pleasure as early as they can, and then, with clear brains and happy hearts, lay their heads upon their pillows, conscious that they have temperately enjoyed a fair holiday, and made the best of Boxing Day.

COME WHOAM TO THE CHILDER AN' ME.

[EDWIN WAUGH, who is regarded, not without reason, as a sort of Lancashirs Burns, has published several volumes of poems well deserving to be known to working men. From one of Mr. Waugh's volumes we take the following poem, already a household song in Lancashire, as a happy example of power.]

Aw've just mended th' fire wi' a cob;
Owd Swaddle has brought the new shoon.
There's some nice bacon collops o' th' hob,
An' a quart o' ale-posset i' th' oon;
Aw've brought thi top cwot, does ta know,
For th' rains comin' deawn very dree;
And th' har'stone's as white as new snow;
Come whoam to the childer an' me.

When aw put little Sally to bed,
Hoo cried, 'coose her feyther weren't theer,
So aw kiss'd th' little thing, an' aw said
The'd bring her a ribbon fro' th' fair;
And aw gav' her doll, an' some rags,
An' a nice little white cotton ho';
An' aw kiss'd her again; but hoo said
At hoo wanted to kiss *thee* an' o.

An' Dick, too, awd sick wark wi' him,
Afore aw could get him up stairs;
Thae towd him thaed bring him a drum,
He said when he're sayin' his prayers;
Then he look'd i' my face, an' he said,
"Has th' boggarts ta'en hould o' my dad!"
An' he cried whol his een were quite red—
He likes the same weel, does yon lad!

At th' lung-length aw geet him laid still,
An' aw hearken't folks feet as went by;
So aw iron't o' my clooas reet weel,
An' aw hanged em i' th' maiden to dry!
When aw'd mended thi stockin's and shirt,
Aw sit deawn to knit i' my cheer,
An' aw rayley did feel raither hurt—
Mon, aw'm *one-ly* when theaw artn't theer.

"Aw've a drum and a trumpet for Dick;
Aw've a yard o' blue ribbon for Sal;
Aw've a book full o' babs; an' a stick
An' some bacco and pipes for mysel;
Aw've brought thee some coffee an' tay—
So thae'll *feel* o' my pocket, thae'll *see*;
An aw've bought tho a new cap to-day—
But aw olez bring summat for *thee!*

God bless tho, my lass; aw'll go whoam,
An' aw'll kiss thee an' th' childer o' reaund;
Thae knows, at wherever aw roam,
Aw'm fain to get back to th' owd greawnd;
Aw can do wi' a crack o'er a glass;
Aw can do wi' a bit ov a spree;
But aw've no gradely comfort, my lass,
Except wi' yer childer and thee.

Working Men's Towns on the Upper Rhine.

THE success that has attended the establishment of the workman's towns at Mulhouse, undertaken with praiseworthy zeal in 1853 by a private company, is well known. A generous contribution on the part of the Emperor Napoleon favoured the enterprise beyond all expectation. Imitating the example set by Mulhouse, the town of Guebwiller, and other manufacturing localities of the Lower Rhine, have established workmen's towns. The Industrial Society of Mulhouse has published in its Bulletin a remarkable report by M. Penot upon these useful and philanthropic creations. Doubtless, a few extracts from this conscientious work are calculated to interest our readers.

The plan the Mulhouse Society proposed to itself to carry out was to construct houses adapted to the

accommodation of a single family, and to sell them at cost price to the working men, granting them long terms of payment, extending to fourteen, or even sixteen years. When the houses do not immediately find purchasers, they are let. The sale of the houses is made on certain conditions: the object of which is the maintenance of order, cleanliness, and a certain external uniformity; but without putting any unpleasant restraint on the purchaser. No workman is eligible to the purchase or hire of a house unless he engages to send his children to school.

A deposit of from £10 to £12, according to the value of the property, is required upon effecting a purchase. The remainder of the purchase money is paid in monthly instalments of fifteen shillings to a pound, until the whole amount is liquidated. If a working man desires to become the purchaser of a house before he has saved the £10 or £12 required as first deposit, he may still obtain possession of the house on the sole condition of increasing the amount of his monthly payments until the increase amounts to the sum required as a deposit. It is to be remarked that the sale of the houses has always been progressive: of the 700 houses constructed, 614 had found purchasers by the 30th of August last, and 112 are already paid for in full; and many of the houses constructed in 1853 and 1854, during the first two years of the building of the town, require the payment of but very small sums to become free from mortgage. When any unforeseen circumstance renders it impossible for the purchaser to continue his payments, facilities for release from his liability are freely afforded him. This transaction is always made a pleasant one; for the buyer is then regarded as if he had been merely a tenant, and the surplus of his monthly payments is restored to him. As for his first instalment of £10 or £12, it is returned to him in full, with interest; for it has not been employed, as the act of sale is always delayed until the certainty of the purchase being completed is placed beyond a doubt.

Independently of the houses intended for sale, a large establishment has been built, which is distributed into rooms suitably furnished, and let to unmarried workmen at the low rate of five shillings a month. These lodgings are clean and wholesome, and there is a common room, warmed and lighted in winter, to which all the lodgers have access during their leisure hours.

Various models have been adopted in the construction of the houses; but each is provided with a garden, the aggregate of which is a great advantage and pleasure to the whole community. Each occupant of a house can grow a portion of the vegetables required for his table; and if they attach a high value to them, it is on account of the agreeable occupation their cultivation affords to themselves, wives, and children.

This may be considered as a public effort for providing working men with suitable homes. The private efforts made in the same direction are happily numerous and extending. We proceed to describe the paper factory at Essonne, which may be considered as the type of the organisation of labour in France, where the proprietor stands in the relation of the father of a family, and not in that of an usurious taskmaster, as is too frequently the case. M. Gratiot well knows that, besides the performance of a duty, there is a great advantage to him in making his work-people contented and happy, and consequently attached to his service. What he has done to this end is to build a workman's town; not a sad and gloomy collection of barracks, but pretty, white houses, well-ventilated, surrounded with trees and flowers. Each dwelling consists of three rooms and a cellar. It costs the working man five francs a month during the first two years; four, three, two, and one franc during the four other years. At the end of the sixth year the house becomes his own property, provided he continues to work in the paper-mill. A garden, on the banks of the river, adjoins the dwellings. Large, well-warmed refectories, or, as we should call them, dining-halls, are provided for the unmarried—one for the women, the other for the men. Large cellars are provided for the storage of groceries, &c., which are bought wholesale, and retailed at cost price. A market is held in the central square of the town twice a day, which enables the workmen to supply themselves with provisions without waste of time. Gratuitous baths, to the number of twenty a day, and four fountains, of a slightly ferruginous water, of agreeable flavour, supply the working-men's town. An asylum-school has also been established. The school and the hall of the contiguous asylum are wholly gratuitous; the first comprises fifty children, the second about seventy. Moreover, adults, in very large numbers, come of an evening, after their day's work is over, and learn reading, writing, and arithmetic, and receive religious instruction. A neat chapel forms an important feature of the town, in which prayers are offered up every evening at eight o'clock, and full service on Thursdays and Sundays, by the vicar of Essonne. Madame Gratiot has her organ conveyed to the chapel, and plays herself an accompaniment to the psalms and hymns sung by the young women employed in the paper-mills. A good many of the work-people of both sexes attend the chapel, and join in the service.

Four Sisters of Mercy direct the asylum, school, and infirmary. A physician is attached to the establishment, who attends the work-people gratuitously, and supplies medicine free of charge. Even in the event of death, M. Gratiot does not abandon his workers. He follows them to the grave, and pays the expenses of their funeral.

The paper-mill of Essonne is a model establishment, in which the relations between employer and employed are well understood. The working population, moral and happy, dwelling amid a charming landscape, is full of health and vigour. Long may it prosper!

A Saturday Sermon.

If there could be a law restricting manual labour to six hours a day, and securing constant and ample employment upon those terms, with increased wages to the workman and higher profits to the capitalist, who would not favour it with all his heart? So if there could be a law by which disease could be abolished, and the heat of the dog-days and the cold of midwinter mollified, who would be so inhuman as to oppose it? Yet, one of these laws is as practicable as the other. All the laws of society are effective only so far as they re-enact the higher law of Nature. When they are opposed to them society pays the penalty of suffering. It is useless to legislate against the attraction of gravity or of cohesion, or to attempt to re-distribute the oxygen and nitrogen of the atmosphere.

The laws of political economy are not less absolute than other laws. They are not determined by our wishes and hopes, but by the actual condition of society. The rate of wages will always depend upon the demand for labour. Capital will always invest itself where it can count upon the highest return. These are axioms or indisputable truths. That capitalists are often unjust, and labourers often oppressed, is true; but that fact does not affect the great law of the relation of wages to the supply of labour and of capital to profits.

Therefore, in the legal regulation of the labour question, we must always bear in mind the inflexible laws which we do not make, and which control those that we do. But, fortunately, political economy, like all other sciences, is capable of development. There are truths already discovered, but there are others which may yet be ascertained. For instance, the exact amount of manual labour, measured by time, which may be most effectively performed by the average labourer under certain conditions of climate and other calculable circumstances, is a fair subject of investigation and experiment. But when it is determined, the result cannot be disturbed. It must be accepted and treated as a truth.

Now labour is a commodity like cotton or corn. Its price must depend upon its supply. Where the supply is greatly in excess of the demand, the price will inevitably be low—where it is inadequate, the price will be high. Every man can understand that proposition. Its truth is not disturbed by the natural desire of every man not to be overworked, and to have time for education and recreation. Suppose that the city of New York should make a law restricting the working day to four hours, upon the principle that, if every man in the world did his fair share of the work of the world, four hours would be enough, what would be the consequence? The demand for labour in the city would cease, and, with its ceasing, wages would decline. And how could this result be avoided? Would you pass a law compelling employers to pay the same wages for four hours' work that is elsewhere paid for ten? That you might do, but the result then would simply be that capital would emigrate. Would you undertake to prevent its removal by penalties? Certainly you would not; and even if you did, and enforced your laws, the inevitable consequence would be the destruction of capital. You may forcibly compel a man to remain in one spot, but no law can force him to use his sagacity to his own disadvantage.

Must the labourer, then, be for ever a mere drudge? and shall the great mass of mankind, who must always live by the work of their hands, be hopelessly debarred from intellectual expansion, the delights of art, and of intelligent leisure, which we call mental culture? Surely not, unless the world is a total failure, and the deepest human faith a lie. But there are no short cuts to happiness. The British labourer is to-day a man who is, in a certain sense, and without any individual responsibility, defrauded of many of his birth-rights as a man. But can Parliament legislate him out of poverty and ignorance into comfort and intelligence? The British labourer drudges fourteen hours a day for a pittance. Why? Simply because the supply of labour is in that excess of the demand. Let the labourer see that in this country or elsewhere he can get higher wages for a shorter day, and he will come here. The result would be that wages would ultimately rise in England and fall in the United States.

Where, then, is the daybreak? In what direction lies hope? It lies, first, in the growing intelligence of mankind; and, second, in invention and science. As we come to see that the comfort and security of every member of society depends upon the general welfare, selfishness will be checked, or, if you choose, refined, while invention will at once multiply and facilitate labour. The cure for all social evils lies in the moral elevation of society, in the increasing spirit of fraternity, and co-operation. And that is as sure as it is slow.—*New York "Journal of Civilisation."*

BLEACHING VEGETABLE FIBRES.

Chlorine exercises a very destructive action upon the colouring matter of vegetable substances, by which it lays bare the fibre, and, consequently, bleaches it, for the reason—1. That it decomposes the water with which it is moistened and impregnated. 2. That it seizes upon the hydrogen set at liberty and forms hydrochloric acid. 3. That it liberates oxygen, which combines with the organic colouring matter, bleaching at the same time it oxidises it. This chemical action takes place only in the presence of water, for dry chlorine is almost without action upon the colouring matter of anhydrous tissues, and then we bring the action of the solar rays to bear. In this case the chlorine is substituted for the hydrogen of the coloured molecule, and forms hydrochloric acid at its expense, which immediately reacts upon the colouring matter of the coloured fibre, and completely destroys it.

An aqueous solution of the alkaline hypochlorites, or of the alkaline earths put into contact with the colouring matter of the vegetable fibre, moistened with water, produces the same effect as chlorine. If we treat the decolouring compounds of chlorine by acids, the result is chlorine and hypochlorous acid; the chlorine being liberated and placed in contact with water, decomposes it, producing oxygen and hydrochloric acid, which reacts anew upon the hypochlorous acid, converting it into water and chlorine, and renewing the preceding decomposition.

It is, therefore, proved—1. That air, decomposed into its two elements, exercises, through its oxygen, a decolouring action upon the colouring matter of the vegetable fibre. 2. That chlorine and the hypochlorites act, strictly speaking, only mediately and indirectly upon the decolouration of the fibre, and serve, in the bleaching only as an element for the decomposition of the water. 3. That the reaction of chlorine and the hypochlorites upon the water with which the articles to be bleached are impregnated, may be compared with the action of the chemical rays of the solar spectrum, since these latter decompose in the same manner the water with which the said articles are imbued, by bleaching and destroying their colouring matter through the oxygen they liberate.

Bleaching in the meadows, or by means of solar light, may thus be completely superseded by bleaching with chlorine or hypochlorous acid; while, in the latter method, no secondary actions are developed, which generally result in the destruction of the raw material itself which it is desired to bleach.

New Inventions and Patents.

IMPROVED LAMP FOR MINERAL OILS.

The mineral oils known as paraffine, petroleum, and cazeline, possess such valuable qualities as sources of light, that it has ever been a source of regret that their burning is attended with several great inconveniences. There is great difficulty in trimming the lamps as ordinarily constructed, and they are liable to smoke, and fill the room with soot and an insufferable odour, if the oils are imperfectly burned. The soot and bad smell never arise except through imperfect combustion of the oil, however inferior or *impure*, even, that may be, provided the lamp in which it is burned combines the two conditions essential to the production of a good light—namely, first, the development of sufficient heat to rapidly effect the volatilisation of the oil, and convert it into a gaseous vapour; secondly, the contrivance for a supply of air sufficient to burn the vapours formed: we shall then obtain a light at the same time brilliant and inoffensive.

Impure oil leaves a solid residue or crust on the wick, which necessitates frequent trimming and renewal, in order to restore the capillary attraction; but all the volatile parts being decomposed by combustion, or converted by it into hydrogen and carbonic acid—two completely inodorous gases—absolutely nothing will be produced of an unpleasant odour.

But if, with the abundant distillation of vapour spoken of, the quantity of air, and, consequently, of oxygen, supplied to the flame be not in the requisite proportions, then a portion only of the vapour will be burned. The remainder, being conveyed into the atmosphere by the current of burned gas, naturally spreads through the apartment, and impregnates its atmosphere with a penetrating, insufferable odour; or else a dense and acrid smoke arises, which deposits itself upon everything in particles of smut, or lampblack, which is a sublimated carbon.

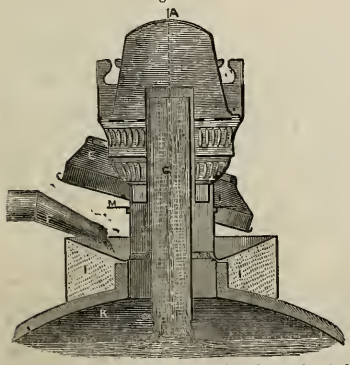
In a given burner, constructed on rational principles, we must require of it only the quantity of light it can properly supply, and neither more nor less. If the light be below the normal volume, the carbon only is completely burned, the other vapours but partially so. Above this volume, then, the other vapours are wholly burned, while a considerable quantity of lampblack is formed. This is what happens with an ill-regulated burner, and with a badly cut, uneven wick, or one cut in the usual manner for lamps burning vegetable oils—that is, quite level.

In fact, the mineral oils being very rich in hydrocarbons, they demand much less height of wick in burning; besides, as they are much lighter, they obey capillary attraction more readily. Hence they exercise greater differential effects, according as circumstances happen to influence them.

These influences are apparently very trifling, but their effect is great. Thus, the borders or edges of a flat wick, such as is generally adopted, being held, in a measure, between three sides of the wick-holder, while the middle of the wick is in contact with two sides only, it happens that the oil flows more freely to the edges than to the middle of the wick, producing a horned flame—a defect favoured also by the freer access of air upon three sides of the flame. The least unevenness on the upper edge of the wick-holder, the slightest prominence on the surface of the wick, a small foreign substance deposited thereon, a little mushroom—the merest nothing, in fact—is sufficient to cause irregularities in the flame. Every one who burns mineral oil knows how difficult it is to trim a wick that will give a round flame free from horns—the only one that will yield an agreeable and economic light. Many persons have given up using these oils solely on account of this difficulty, notwithstanding the undoubted advantage of this light over all others.

Frequent attempts have been made to overcome this obstacle, but none have succeeded, and the only *expedient* found to remedy the inconveniences of trimming is, not to cut the wick at all when once it is in good condition. Therefore, it is burned several days in succession without being trimmed, and when it has become hard and concrete by carbonisation and deposits of crust. the wick, instead of being cut, is broken off with the fingers, and made even by rubbing it at the top of the holder, either with the finger or a piece of rag. In this way the wick may be renovated to the same condition as it was in at first. Let whatever precautions be taken, it still happens that the filaments torn from the wick produce points in the flame, and cause the consumer to despair.

Fig. 1.



Mr. Tremeschini, well known by his electro-chemical researches, offers a new burner to public attention, which appears to merit what publicity we can give it, inasmuch as it radically suppresses the inconveniences noted above.

Our engravings will be intelligible to all who are engaged in the construction of lamps of this kind. To others, and especially to the mere consumer, we have to state that the improvement consists chiefly in substituting for the continuous wick a double wick of cotton wool, C, dipping into the oil, and terminating at its upper end in two pads, each formed by a tuft of cotton folded upon itself. These two pads are formed like two lips, between which the tongue is inserted. Better than any other phrase, *to draw the tongue* expresses the function of this tuft. It may be termed alimentary, or feeding, in relation to the independent wick, as shown in Fig. 3, and which is the real wick of the lamp. It may also be seen occupying its place, under the same designation, in Fig. 2. This double tuft is contained in a square copper tube, which is made to move up and down within a small space in a similar tube, which serves as a holder to it. The slight motion required is produced by the lever, H. Between the two lips, raised to their highest, and held open by their mutual spring, the alimentary wick, prepared beforehand, is inserted, as a provision. It is nothing but a similar simple tuft of cotton wool, folded, flattened, and held together by a hand of incombustible paper.

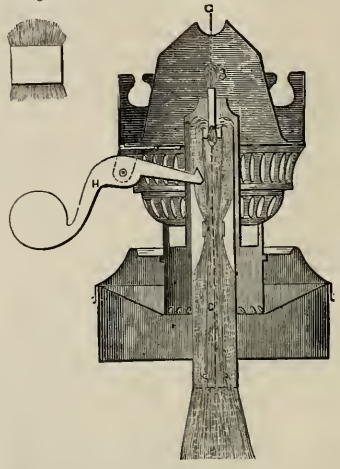
The wick, as may be seen, is very short, and arranged at the top in the shape most favourable to the production of a good flame. When lighted, a very slight movement of the lever, H, suffices to regulate it to a given point, and so obtain a good light, the intensity of which may be varied within certain limits—that is to say, between the point where the gas begins to burn, and that at which the flame begins to smoke.

The range comprised between the two limits is much greater in the new burner than in the old ones, which is due not only to the perfect form of the wick, but also to the manner in which the air is distributed, from having access round the wick and to the interior of the distilling tube in the centre (Fig. 1). This arrangement may not be entirely new, but it is, at least, much improved in the new burner, so as to yield a result not hitherto arrived at.

It will be understood that the independent wick is replaced when used up, *but never trimmed.* And as it is made a regular and special object of manufacture, costs but twopence a dozen, and that one will last a week burning six hours a day, we may conclude that the independent wick is the true solution of the difficult problem of wicks for mineral oils. It gets rid of trimming, of the inconvenience of the screw, which lets the woven wick run down when it is too thin, and will not turn at all when the wick is swelled with oil. Let us not omit to remark also, that, the tuft wick being always of the same length, the suction, contrary to what takes place in the woven wick, is the same at all times.

To these improvements connected with the wick, Mr. Tremeschini adds another no less important, which concerns the safety of the employment of mineral oils.

Fig. 3. Fig. 2.



We do not admit that the mineral oils are so dangerous as frequently represented. Still, it cannot be denied that they are much more inflammable than the vegetable oils, and susceptible of taking fire at a certain temperature, which varies with their density.

It may, therefore, happen that a lamp which has been kept burning for a long time, may become so heated that a small quantity of oil remaining at the bottom will take fire if a burning body is brought near to it; but it must be on the condition that air has free access at the same time. These accidents, however, occur but seldom; but it is sufficient that they do occur, to make it a duty to endeavour to avoid them.

Now, it may happen that after a long evening, the oil being nearly, but not quite spent, it becomes necessary to replenish the lamp. Prudence suggests the propriety of lighting another lamp, or a candle kept some distance away from the exhausted lamp, then extinguishing the latter, and lighting it again after it is filled. But these precautions are not always taken, and the lamp is refilled while still burning. By pouring the liquid oil into the lamp, the heated vapour is driven out, comes into contact with the flame, and explosion ensues.

The new burner we have described above is so constructed, as to render an accident of this kind impossible. When properly arranged, the flame is isolated from all possible communication with the reservoir, and these conditions remain unaltered at the time the oil is poured in. A simple independent cover being lifted, displays a cup pierced with holes, communicating with the reservoir, which is the top of the stand, or foot. Into this cup the oil is poured. Meanwhile, no communication is possible with the flame quadrupally separated from the reservoir by 1, a diaphragm inserted at M; 2, the cover, E; 3, the base of the reservoir; and 4, another internal diaphragm, performing the same office as the wire gauze in Sir Humphrey Davy's safety-lamp.

We are of opinion that the objections to the use of mineral oils are now wholly removed by the independent wick, and security from explosion prevented by Mr. Tremeschini's lamp; and we hope they will receive that public favour to which the brilliancy and economy of the light they yield justly entitles them. The lamps, as usually constructed, are made much too low; the consequence is, that the light strikes painfully upon the eyes. It may be that these lamps are made low to avoid the risk of their being upset. The flame ought to be at least as high as the top of the head of a person seated at a table.

IMPROVED COTTON PRESS.—A new cotton press has been introduced, which may deserve the attention of shippers. It is called Ashcroft's patent compound press, and is alleged to reduce a bale of cotton of 600 lb. in about a minute to between 25 lb. and 30 lb. to the cubic foot.

General Information.

EXHIBITIONS.

THE METROPOLITAN AND PROVINCIAL WORKING CLASSES INDUSTRIAL EXHIBITION will be held at the Agricultural Hall, Islington, in August next.

THE CITY OF LONDON WORKING CLASSES EXHIBITION will be held in Guildhall, under the direction of the City Lands Committee and the Guildhall Improvements Committee. It will remain open six weeks.

HULME.—A Working Men's Exhibition was opened at the Institute on the 18th ult. Modest in its pretensions, but highly meritorious in its results. Fully four-fifths of the contents were the handiwork of working men and their wives.

SOUTH-EAST LONDON EXHIBITION.—This Exhibition will close during the present month: we shall then give a detailed account of its peculiar features and characteristics. It is gratifying to be able to state that this Exhibition has been exceedingly well attended, and it is expected that the pecuniary result will be quite satisfactory.

PARIS EXHIBITION.—The committee of the Universal Exhibition of 1867 has just decided that there shall be no days of admission gratis. The charge will be one franc, except on Friday, when it will be five. Persons who may wish to enter before 10 in the morning will pay one franc extra. The price of season tickets will be 100fr. for men, 60fr. for women, and 20fr. for children.

SOLDIERS' EXHIBITION IN INDIA.—A Soldiers' Exhibition was opened by his Excellency the Governor, at Poona, on the 1st of November last. It was a great success. His Excellency Sir Bartle Frere made the following observations:—He said that it was with great pleasure he attended on this occasion, as he looked upon an exhibition of this natnre as one which was of more importance than the mere sight of so many useful and well-made articles as were set out in the room. He looked upon it as a great step towards the amelioration of the position of the British soldier. He was old enough to remember the time when "to go for a soldier" was looked upon as going to ruin by the fellow villagers of the new recruit. He knew it was then the opinion of many men—and men for whose opinions he held a great respect—that a soldier should be a good fighting man, and nothing else; that the nearer you lowered him to become a mere machine, the more perfect soldier he became. Nothing was done towards his moral benefit. Long service was looked to as a necessity, and the poor worn-out invalid who returned to the home of his youth with many scars and a small pension, was neither in a moral, nor in any other respect, an incentive to the youth of his neighbouhood to join the ranks. Many present could corroborate his (Sir Bartle's) statements. The first thing which led to an alteration in such matters was the Crimean war. Then it was found that mere machines, however well they could fight, could not help themselves in other ways—they could not pitch their tents, or turn their hands to anything beyond the actual fighting portion of the business: fight they did, and that right well, but nothing more. Now it was to improve such a state of matters that, amongst other things, regimental workshops were instituted, in order that the men might be enabled to use their spare time to some profit. Short terms of service had the effect of making men who looked to the future consider that while they were learning and doing their duty as soldiers, they were forgetting the trade of their youth, which, in their more mature years, they would again have to look to for a livelihood. They were, therefore, anxious to leave after the first period of service had been got over, whereas, those were the very men whom Government wished to retain. Now, the workshops gave these men the opportunity they wanted. They could carry on their trade and improve in it, while, in the meantime, they were earning their pensions as good soldiers, it would assist them in their old age. Another benefit which Sir Bartle pointed out as likely to arise from the regimental workshops, was for the young—the boys of the soldiers. In England, who has not seen, in a village, some of the sharpest lads always hanging about the workshop of the carpenter, blacksmith, &c., and having a finger in the work? Here, where it was but too often the difficulty of the soldier parent to know what to do with his son, these workshops were the very thing; and he had no doubt the youth would soon cut their fingers in the one, or burn them in the other, as their fellow-country youths in England did. Sir Bartle enlarged somewhat more on this subject, and then tendered, not only his own, but the thanks of Government, to the members of the committee for what they had done to further this excellent object, and congratulated them on the success which had attended their efforts.

CLUBS.

MARYLEBONE AND PADDINGTON.—A club for this district has been recently opened at the corner of Newcastle Place and Edgeware Road, under favourable prospects of success.

WESTMINSTER WORKING MEN'S CLUB.—The fifth anniversary of this institution, which is situated in Duck Lane, near Victoria Street, and is so well known in connection with the philanthropic labours of Miss

Adeline Cooper, was celebrated by a public meeting. It was the last that will be held in the old house; but another is being built in Pye Street, Westminster, with a lodging-house to accommodate between 50 and 60 of the poor families who are being ejected from their dwellings, and are left literally houseless. The neighbourhood is very poor, and there is plenty of room for skill in adapting benevolent effort to its wants. Miss Cooper has established a penny bank, an enrolled labour loan society, a temperance society and sick fund, a barrow club, a cricket club, a labour registry, educational and Bible classes, a free library, &c. The club is open every evening, Sunday included, from 6 till 10.30, and the subscription is one halfpenny per week.

WORKING MEN'S CLUB IN SPITALFIELDS.—A handsome building, called the Bedford Institute (in memory of the late Peter Bedford), has recently been erected by members of the religious Society of Friends, in Wheeler Street, Spitalfields. The upper storey has been for some time used as a Sabbath-school, and for other kindred purposes. The ground floor was opened on the 18th ultimo as a Working Men's Club. A public meeting, presided over by B. Scott, Esq., Chamberlain of London, opened the proceedings. The chairman, and Messrs. Beck, Taylor, Stepheus, Nicholls, and Hine pointed out the advantages of these institutions for improving the condition of working men, and invited all present to co-operate in the present undertaking. After the meeting, the club-rooms were opened, and about seventy members were at once enrolled. The architect of this really fine building is Mr. William Beck, of Finsbury Circus, who has given his professional services gratuitously, and has laboured most indefatigably for the success of the undertaking.

STRATFORD WORKMEN'S HALL AND CLUB ROOMS.—The opening of these capital premises, which have recently been erected at considerable cost, and are of a most complete character, was celebrated by a *soirée*, under the presidency of Sir T. F. Buxton, Bart., M.P. The meeting was crowded to excess, and the proceedings were most interesting. After tea, practical and stirring addresses, interspersed with well-selected and admirably-rendered pieces of vocal and instrumental music, readings, and recitations, were delivered by the chairman and by Mr. Serjeant Atkinson, the Rev. H. Solly (Secretary of the Club and Institute Union), Ebenezer Clarke, Esq., and others; and the meeting separated after cordially passing the usual votes of thanks. It is exceedingly gratifying to be able to say that this excellent hall, which has cost about £1,400, was opened free from the grievous incubus of a debt, owing to the kind generosity of several of the contributors, and among them Mr. J. G. Barclay, Mr. T. F. Buxton, Mr. S. G. Buxton, Mr. J. J. Lister, Mr. S. Harrison, and others, who doubled the handsome donations they had already given. There is everything to inspire the hope that this institution, which has been so successfully launched, may be well appreciated by those for whose special comfort and good it has been created, and in whose hands its future mainly rests.

WHITTLESFORD.—A new hall and club has been erected in this town at the expense of Mr. Maynard, agricultural implement maker, and is presented by him, free of rent, to the working men of Whittlesford, for a Club and Institute. It is admirably arranged, by means of folding partitions, to combine all the ordinary rooms of a club with the use of a hall for concerts, lectures, &c., capable of seating 500 people. With the exception of an institution somewhat of this kind, established by Miss Hopkins at Cambridge, this is the first genuine Working Men's Club that appears to have been established in the Eastern counties, which have been rather behind-hand in this movement. It is to be hoped Mr. Maynard's liberality and the important meeting held at Whittlesford will help to wake them up a little, and cause many Working Men's Clubs to be established, where they certainly are much wanted.

BENEFIT SOCIETIES.

WORKING MEN'S COLLEGE, GREAT ORMOND STREET.—At a meeting held for the purpose of starting a Benefit Society in connection with this College, the chairman, Mr. Thomas Hughes, M.P., made the following remarks in reference to benefit societies generally, which cannot be too often repeated, seeing how much misery ensues from not taking due precautions in the investment of savings, to secure a provision against sickness and old age:—"The great majority of benefit sociaties were, he was sorry to say, holding out to the persons who joined them false hopes. They start upon Tables which are framed upon too low a scale, and make promises which they cannot fulfil. Such societies were undoubtedly doing great injury, because a man during the last years of his life paid his subscription with a view of securing a provision during sickness and old age, which it is utterly impossible that they can secure under the rules; the societies consequently break down, and their members lose the money which they have paid. Now, he could speak from personal experience, because he had been a very poor man in his time—he was not rich now; but when he came to London, a very young man, he was very poor, considering his station in life. At that time he felt it was his duty to insure his life; he did so, and could truly say that he never took a step in his life which had proved more satisfactory. The habit of providence which societies of this kind induced was one of the best habits which a man could contract. It was all very well for a working man to say, 'I will put so much money by and take care of it;' but without periodical payments were enforced, he would find such a proceeding very difficult. He had great pleasure in being present that night, because he was perfectly confident that if that society were started, and its tables adhered to, the promises contained in its rules would be carried out, and they would never experience the misery, after they had paid for years into it, of finding that they had paid their money for nothing. He hoped they would start, as sailors said, with 'a flowing sail,' and that the society would prove a benefit to the members of the college, present and to come."

BELPER PERSEVERANCE LODGE OF ODD FELLOWS.—The members of this branch of the London Order, held at the "White Swan Inn," have just given an instance of the appropriateness of the name of their lodge. Up to the present period they have had no fund for the relief of the widows and orphans, and now, in order to establish such a fund, the members themselves have determined to make some sacrifice. They have agreed to give up their usual half-pint of beer, at the fortnightly meetings, and devote it to the widow and orphan; in addition to that, they are about paying one shilling each as a gift for the same object, and also an increased contribution monthly. The whole of the members being of the hard-working class, their resolve cannot be too highly commended, and all patrons and subscribers to these valuable societies will hail with great satisfaction the fact that the three halfpence per member once a fortnight will go to the widow and orphan, instead of being expended in beer. "Charity begins at home," and the members have resolved upon this, in order to make themselves deserving of the assistance of a few liberally disposed persons, who look upon this movement with favour. Nobody can over-estimate the great relief which these societies afford to parochial establishments; and, as it also encourages and fosters a spirit of self-dependency in the hard-working man, they cannot be too highly commended. The ending of the old year, and the commencement of the new, could scarcely be signalised in a more praiseworthy manner than by this instance of forethought and thrift in the working man.

WAGES.

THE ADVANCE OF WAGES.—A general demand for an advance in the prevailing rate of wages, to the extent of ten per cent., has led to the holding of meetings among engineers, mill-wrights, machinists, steam-engine makers, chair-makers and carvers, pattern-makers, silk-weavers, organ-builders, plasterers, colliers, farriers, journeymen bakers, excavators, and others. In some cases the demand for increased wages was attended by a strike, but generally the workmen have obtained the advance demanded without resorting to that step.

STRIKES.

THERE is a lull among strikes at present, on the principle that "after a storm comes a calm." It is much to be wished that they could be dispensed with altogether, and all misunderstandings and disputes between masters and men be referred to arbitration. This mode of settlement has been successfully tried by the house-carpenters and joiners of Wolverhampton. There has, however, been a strike among the police at Nottingham, which led to the dismissal of eight men.

We do not look for strikes among our neighbours across the Channel; but, recently, we learned of a strike among the velvet weavers at St. Etienne, "to the detriment of the manufacture and the workmen themselves." The looms, which are 2,500 or 3,000 in number, were all abandoned at the same time, both by the foremen, who are engaged by the masters, and by the hands, who work for the foremen. No notice was given, although the former ought to give three months' and the latter a week's warning before leaving off work. The motive for the strike was that the masters would not sign a tariff drawn up by the workmen in a meeting, and presented by delegates. If, however, the workmen have the right of coalition, they had certainly not that of refusing to fulfil their engagements, and this view has been taken by the Council of Prud'hommes, before which several of the foremen and weavers have been summoned. What will be the termination of the dispute no one can say. If the workmen were left to themselves, they would soon resume labour; but we learn that they are under an influence alien to their industry, and the present situation may last for a considerable time, although the majority of the men wish to resume work. Several of the men on strike were tried before the police court of that town last week. One weaver, named Roche, having worked contrary to the orders of the leaders, had a visit from two of the delegates, one of whom told him he wished he saw him hanged. The law officer who prosecuted said that no doubt the observation was of little consequence, but it should be known that of 2,000 men on strike, there are 1,950 who want to return to their work, but are intimidated by the other fifty. One of the delegates was sentenced to imprisonment for four months, and the other to the same punishment for forty days. In another case three weavers were sentenced to imprisonment for two months each.

WORKING MEN'S DWELLINGS.

THIS subject has assumed greater importance in the metropolis than ever, in consequence of the vast demolitions going on in connection with railways. The evictions are numbered by thousands, and where the majority of those turned out of house and home will find shelter is a mystery we cannot attempt to solve. The evils of overcrowding—always great—will be increased, to the great injury of the health of the working population. The matter has excited the sympathy of several philanthropic persons; but the efforts to remedy the great and increasing evil of overcrowding are but as a drop in the bucket compared with what is required. The bane and the antidote, however, are not wholly separated. Railways cause the evils of which we complain, and railways offer something of a remedy, by providing frequent and cheap access to the suburbs. Let the working man by all means avail himself of the facilities thus afforded for escaping the physical and moral deterioration to which overcrowding exposes his family. Let him secure a little cottage and garden, if possible; it will be a boon to himself, and a blessing to his family, who will be enabled to enjoy those prime essentials of life—light and pure air—to a greater extent than is possible in an overcrowded town.

LAMBETH.—A large meeting was lately held at the Lambeth Baths, to consider the best means of erecting improved and cheap dwellings. It was proposed that a limited company should be formed, partly by the contributions of the workmen themselves, and partly through the aid of capitalists. The success of companies already in operation on this ground, was held out as an earnest of the prospects of any new association that could take advantage of the experience that had been gained in the matter. A resolution was moved setting forth the necessity for immediate action in the matter, and recommending the co-operation of the working men themselves as one of the most effectual means of obtaining improved and cheaper dwellings. Alderman Waterlow had shown how such houses could be made to pay. The resolution was carried, and a committee appointed to conduct the matter.

NEWCASTLE-ON-TYNE.—An important movement has been set on foot here for the erection of model lodging-houses and cottages for the working classes, accommodation in which the great towns on the Tyne are very much deficient. The movement has been initiated by some earnest sanitary reformers and persons of influence here, so that there is every hope of its being carried out with the energy necessary to success.

SOUTHWARK PARK.—At the monthly meeting of the Rotherhithe vestry held recently, a deputation was appointed to wait upon the Metropolitan Board of Works, for the purpose of presenting a memorial, urging the necessity of proceeding with the formation of the new park for Southwark, which was sanctioned by an Act of Parliament passed last year. The Metropolitan Board has contracted with the freeholder for the site, and negotiated a loan for the amount required; and the memorial sets forth that, as the level of a portion of the land will require to be raised, an advantage will be gained by the immediate formation of the park, as the refuse earth, &c., of the main sewer works now in progress at Rotherhithe can be made available, and thus reduce the expenditure.

LEGAL DECISIONS.

MASTER AND SERVANT.—A carpenter in the employ of the Vale of Neath Railway Company was going up a ladder to a scaffolding erected close by a turntable, when an engine, which was being turned round on the turntable, struck the ladder, and he was thrown to the ground and much injured. The accident was owing to the negligence of the porter who had the management of the turntable. The carpenter brought an action against the company, but the Court of Exchequer Chamber has decided that the plaintiff and the porter were servants in a common employment, and that therefore the case came within the well-known principle that a master is not liable to one servant for injury done to him by another who was engaged in a common employment with him.

INTIMIDATING WORKMEN.—Two stonemasons have been convicted and sentenced to two months' imprisonment with hard labour, for intimidating and endeavouring to prevent certain men in the employ of Mr. Pritchard, a builder, from continuing their work. The Lord Mayor, addressing the prisoners, said the case against them of threatening and intimidating the men Shearman and Newton was, in his opinion, most conclusively proved, and he should mark his sense of their misconduct. A working man had a right to take his labour and skill, which were his capital, to what he conceived the best market, but he had no right to dictate to others the terms and conditions on which they should exercise their handicrafts, or say to this man or that man that, if he did not coincide with him in the disposal of his labour, he should subject him to personal violence. That was a species of tyranny upon the odium of which he had long pondered, and he could only suppose that the prisoners were men hardly capable of gaining a livelihood in a fair competition with men of their own trade. The witnesses had given their evidence fairly. They were entitled in such a state of things to the protection of the law, and that protection, so far as he could afford

it, they should receive at his hands. He would say further, that if they, or any other workmen within his jurisdiction should, after this, be subject to the slightest molestation or intimidation, or be threatened with personal violence, and would only apply to him, they should be protected. There was a large class of working men unconnected with trades' unions, who simply wanted to earn an honest living by the exercise of their skill and industry. On the contrary, men like the prisoners did —what? combined to prevent them. Such conduct was intolerable.

TURNPIKE TOLLS AND WORKMEN.—A case of considerable importance to workmen was recently decided by Mr. William Walker, chairman, and other justices, at the Doncaster West Riding Police Court. A working potter, named Shaw, was summoned at the instance of the trustees of the Doncaster and Tinsley turnpike-road, for evading payment of toll. Along the valley of the river Don, which is navigable, large works have sprung up, and the trustees, in a recent Act, obtained powers to place a bar between Mexbrough and Conisbrough, and also to charge a toll of 1d. for every foot passenger that goes over a bridge close by. Large numbers of workmen reside at Mexbrough on one side of the river, and work at a large colliery and pottery on the other; and it was alleged that, among others, a man named Elijah Shaw had evaded payment by crossing the river at a point higher up than the bridge in question, then, walking down the hauling-path, trespassed across several fields, and gained the turnpike again below the bridge. As many workmen crossed, it was of some importance that the law should be defined. It was shown that Shaw had thus evaded toll, and had not obtained a weekly ticket, as many other men had done, for fourpence, to give them permission to pass whenever they liked within seven days. The defendant pleaded that he had such weekly ticket, and produced it; and he further said that he had shown the ticket to the toll-bar keeper, at the time he was seen to be passing another way than over the bridge in question, but that he went there as the nearest way. The ticket did not contain the name of the defendant, nor was it usual to put names upon the tickets issued; whereupon the Bench gave the defendant the benefit of the doubt, and dismissed the information. They advised the toll-bar keeper to write the name of the holder of the ticket upon it, and it then could not occur, as was now pleaded, that the ticket could be paid for by one person and used by another. The toll on the bridge has long caused much excitement in the district.

PUBLIC WORKS.

NEW METROPOLITAN TRAMWAYS.—A renewed endeavour will be made in Parliament to obtain powers to lay down improved tramways for omnibuses, also of a much improved character. The top edge of the rail will be flush with the pavement, very narrow, and will present no obstruction to wheels; and those adapted to it can readily get off or on it. The projected company will be bound to maintain a strip of the road seven feet in breadth for each line of rails, although no exclusive right to travel on them will be reserved. The company will be competitive with the General Omnibus Company; and no doubt this itself will constitute a strong recommendation to Londoners, who desire to supersede, by an English company, the French association, which at present overrides the citizens with their bad draughty omnibuses and their broken promises. If otherwise objectionable, tramways would promote the regulation of traffic, and obviate the necessity for demolishing some hundreds more houses by running railways through various parts of the metropolis.—*Builder.*

WATERLOO AND WHITEHALL RAILWAY.—The works of this company's lines are progressing. At a short distance from Charing Cross Bridge, and between the north and south shores of the Thames, groups of piles have been driven into the bed of the river, marking out the sites for the piers and the route of the line, which will be nearly parallel with the railway bridge. The ground for the Whitehall station in Scotland Yard has been enclosed, and a coffer-dam commenced for the formation of the north abutment. Running from the station in Scotland Yard, the line will be carried in brickwork beneath the tunnel of the Metropolitan District Railway, and then under the Low Level Sewer to the northern abutment. From this iron tubes of 16 ft. diameter, are to be laid on the clay beneath the river. The trough in the bed of the river is now being dredged for the tubes. From the south abutment the line will be completed to the Waterloo Station in brickwork, passing on its way beneath the Belvedere and York Roads to a terminus near the South-Western Railway Station. At the cab entrance to the Waterloo Station in the York Road will be the pumping station, where the engines, &c., are to be erected for working the traffic. It is expected that this pneumatic railway will be finished in about twelve months.

CINCINNATI SUSPENSION BRIDGE.—The new bridge about to be suspended over the Ohio river at Cincinnati will be the longest structure of the kind in the world, being more than 2,000 ft. longer than that over the Niagara river, and 540 ft. longer than the Menai-bridge, England. Its total span will be 1,057 yards. The stone piers rise 110 ft. above the floor of the bridge, and 200 ft. above their foundations. One year is allowed for building it.

Chips and Shavings.

HE who can bear to be told of his faults is on the way to become a philosopher.

"I CAN'T find bread for my family," said a lazy fellow in company. "Nor I," replied an industrious miller, "I am obliged to work for it."

A BARNSLEY RECIPE.—The best way to prevent a kitchen door creakin', is to get a servant lass a's a sweetheart cums tut house to see her.

IT is a singular fact that the pattern now most common upon Paisley shawls, and which had always been a favourite, is said to have been in use among the Hindoos three thousand years ago.

A GENTLEMAN of the name of Pepper had been thrown several times from a spirited horse, and was relating the circumstance to a friend, at the same time observing he had never given his horse a name. "I think," observed his friend, "you should call him Pepper-castor."

AT an examination of girls for the rite of confirmation in the Episcopal Church, in answer to the question, "What is the outward and visible sign and form in baptism?" the reply of a bright little theologian was, "The baby, sir."

BRASIDAS, the famous Lacedemonian general, caught a mouse; it bit him, and by that means made its escape. "O Jove!" said he, "what creature is there so contemptible but that it may have its liberty, if it will contend for it!"

DAILY WORK.

WHO lags for dread of daily work,
And his appointed task would shirk,
Commits a folly and a crime:
A soulless slave,
A paltry knave—
A clog upon the wheels of Time.
With work to do, and store of health,
The man's unworthy to be free
Who will not give,
That he may live,
His daily toil for daily fee.—C. M.

"WILL you have it rare, or well done?" said an Englishman to an Irish friend, as he was cutting a slice of roast beef off the Christmas joint. "I like it well done here," replied Pat, "for it was rare enough I ate it in Ireland."

THE tears of a family may flow together, like those little drops that compact the rainbow; and if they be placed with the same advantage towards heaven as those are to the sun, they, too, have their splendour; and, like that bow, while they unbend into reasonable showers, yet they promise that there shall not be a second flood.—*Andrew Marvel.*

IT's hard work to do nothing, and have too much of it on hand. It's hard work to collect a debt from one who says, "I'll pay to-morrow." It's hard work to refuse a good offer, and it's harder still to be compelled to accept a bad one. It's hard work for many people to live, and doubly hard for some to die.

"WHEN I goes a shopping," said an old lady, "I allers asks for what I wants; and if they have it, and it's suitable, and I feel inclined to take it, and it's cheap, and it can't be got anywhere else for less, I almost allers take it, without chaffering about it all day as some people do."

CURED.—The following story is told of the Reverend Doctor Morse:—At an association dinner, a debate arose as to the use of the rod in bringing up children. The doctor took the affirmative, and the chief opponent was a young minister whose reputation for veracity was not high. He maintained that parents often do harm to their children by unjust punishment from not knowing the real facts of the case. "Why," said he, "the only time my father ever whipped me, it was for telling the truth." "Well," said the doctor, sarcastically, "it cured you of it, didn't it?"

BE SOMETHING.—Don't be a drone. You may rely upon your present possessions, or on your future prospects, but these riches may fly away, or hopes may be blighted; and if you have no place of your own, in such case, ten to one, you will find your path beset with thorns. Want may come upon you before you are aware of it; and, having no profession, you find yourself in anything but an enviable condition. It is, therefore, important that you should be *something.* Don't depend upon fortune, for she is a fickle support, which often fails when you lean upon her with the greatest confidence. Trust to your own exertions.

WHAT is there a man cannot save and improve? By curbing appetite and restraining passion, by observing prudence and maintaining regularity, he may save his health, husband his strength, and thus preserve the springs of health, as constant fountains of energy and happiness, to sustain and cherish him under every labour and every hardship. He may save a fortune by industry and denying himself needless indulgence, and he may find a pure enjoyment in devoting it to noble uses. One of the hours each day wasted on trifles or indolence, saved and daily devoted to improvement, is enough to make an ignorant man wise in ten years; to provide the luxury of intelligence to a mind torpid from lack of thought; to brighten up and strengthen faculties perishing with rust; to make life a fruitful field, and death a harvest of glorious deeds.

PRIZES

OPEN TO COMPETITION BY WORKING MEN.

INTERNATIONAL HORTICULTURAL EXHIBITION AND CONGRESS, 1866.—The attention of students in drawing at the Institutions and Evening Classes in Union with the Society of Arts is especially drawn to the following Prizes offered for botanical drawings:—"(237.) Water-colour drawing of any plant, British or exotic, natural size, with the usual magnified dissections; to be drawn or mounted on folio paper, and to combine scientific accuracy with artistic treatment. 1st prize, £5; 2nd prize, £3; 3rd prize, £2." Candidates will observe that these drawings must be sent to the executive committee of the Royal Horticultural Gardens, South Kensington, by the evening of Monday, the 21st of May. Further particulars may be obtained on application to the assistant-secretary, Mr. Richard Dean, 1, William Street, Albert Gate, W.

THE ARCHITECTURAL MUSEUM, SOUTH KENSINGTON MUSEUM, W., 1866.—The following prizes are now offered to art-workmen:—For stone carving, £10, £5, and £2; for wood carving, £15 and £5; for silver work, £15 and £5; for transparent enamels, £10; for opaque enamels, £10; for marble mosaic, £10 and £5.—Particulars of the competitions may be had by a letter to the Honorary Secretary of the Architectural Museum, Joseph Clarke, Esq., 13, Stratford Place, London, W., enclosing a directed and stamped envelope; or of the Attendant at the Entrance to the South Kensington Museum.

CORRESPONDENCE.

*** *We shall be happy to receive any information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* WORKING MAN, *1a Belle Sauvage Yard, Ludgate Hill, London, E.C.*

Greenwich Ripley, Derby, 21st Dec., 1865.

To Messrs. Cassell, Petter, and Galpin.

SIRS,—Will you kindly permit me to attempt to express the pleasure I felt when I first saw your announcement of the new serial you are about to issue; for, among all the periodicals with which I am acquainted—and they are many—there are none that, in my estimation, can be considered as having a direct bearing upon the social condition of the millions of England's toiling sons and daughters—none that can be properly called, "the working man's journal." When I say a working man's journal, I allude to a paper that shall furnish a faithful index to the working man's experience, that shall be the mirror of his true condition; and in order to be that, it must be the vehicle to bear his own thoughts and feelings to the world—it must be the mouthpiece for him to speak of his own experiences. Let the son of toil speak for himself, and his statements are the embodiment of practical common sense, because he speaks from experience, or from observation of the ways and doings of those similarly circumstanced with himself. The speculative theorisms of the college-manufactured rhetorician may be very well in their place, but, for practical purposes, they can never supply the place of the real matter-of-fact stuff that you find in the thoroughly intelligent working man. I once read a gentleman's speech, delivered before a considerable audience, in which he reverted to the agricultural labourers of South Nottinghamshire, and spoke of their intelligence and prosperous condition in the most glowing terms. I can speak from actual observation extending over a number of years, in which I did not fail to get all the information possible from the labourers themselves; and can state from their evidence, conjoined with that of my own eyes, that the statement was a barefaced misrepresentation.

Numbers who listened to that speech would go home with the idea that they had been listening to the truth. How different an impression would have been produced had one of those *prosperous* labourers been in the gentleman's place that day!

For the workman's real condition to be truly understood, he must be left to tell his own tale; since it is him alone who is practically acquainted with it. I can testify that there are numbers of individuals among the operatives who are eminently calculated to advocate the great and important cause of the industrial classes. I could enumerate not a few among my own friends with whom I have become intimate through my connection with various literary institutes and mutual improvement classes; the essay writing abilities of some of those persons truly do honour to them. It is to such institutions as these, in some measure, that I owe my own improvement, as my parents could not afford to send me to school, and I am at the present time working twelve hours per day for fifteen shillings per week; at the same time I have received no little benefit from your own publications, many of which I am in possession of. In reference to the WORKING MAN, if the conditions laid down in your prospectus be impartially adhered to, I am sanguine of an enormous circulation. Coupled with the high standing in the public estimation of the source of its issue, the novelty of the thing will recommend it to multitudes who would not patronise it from worthier motives.

In conclusion, I doubt not that, with God's blessing upon your labours, you will be abundantly satisfied with your success; and you will oblige by transmitting me a few prospectuses, of which I shall not fail to make the best possible use. With best wishes for your undertaking, I am, yours truly, H. M.

NOTICE.—With the present Number of the WORKING MAN is issued gratuitously

THE WORKSHOP ALMANACK FOR 1866,

Which should be delivered to every purchaser.

ADVERTISEMENTS for insertion in the WORKING MAN should be forwarded one week previous to the day of publication, and be prepaid in stamps, according to the following scale of charges:—Personal Advertisements for Situations, &c., 6d. per line; Working Men Institutions, 9d. per line; General Advertisements 1s. per line.

The WORKING MAN will be forwarded by the Publishers, post free, for Twelve Months, on receipt of 13s.

THE ORIGINAL
Chlorodyne, invented by RICHARD FREEMAN, Pharmaceutist.
Consumption, Bronchitis, Coughs, Colds, Whooping-Coughs, Asthma, Cholera, Dysentery, Diarrhœa, Spasms, Neuralgia, immediately relieved, and most cases cured, by FREEMAN'S ORIGINAL CHLORODYNE.
It is largely employed in hospital and private practice by the highest Members of the Medical Profession as a remedy of intrinsic value in the above diseases. In tropical climates it is used, par excellence, as the remedy in Cholera, Diarrhœa, and Dysentery.
The Right Hon. Earl Russell graciously transmitted to Mr. R. Freeman, the Inventor of Chlorodyne, the following extract of a despatch from Acting-Consul Webb, dated Manilla, September 17, 1864:—"The remedy most efficacious in its effects (in Epidemic Cholera) is found to be Chlorodyne, and with a small quantity given to me by Dr. Burke I have saved several lives."
Numerous Testimonials from the most eminent Members of the Medical Profession enclosed with each Bottle.
Manufactured by the Inventor, RICHARD FREEMAN, 70, Kennington Park Road, London, S.
Sold in Bottles, ¼oz., 1s. 1½d.; and 1½oz., 2s. 9d. each, by all Chemists.
CAUTION.—Beware of Spurious and Deceptive Imitations. The genuine has engraved on the Government Stamp, outside each bottle,
"FREEMAN'S ORIGINAL CHLORODYNE."
Be not persuaded to buy any Substitute. [2

A Good Family Medicine CHEST, with a prudent use, has saved many a life; and yet we think the idea might be improved upon, and reduced to a more simple form. Take some good compound, such as Cockle's Antibilious Pills, and we find that the desired end may be obtained without scales and weights, or little mysterious compartments and enchanted bottles with crystal stoppers. Others might be used, but Cockle's Pills, as tested by many thousands of persons, and found to answer their purpose so well, may be set down as the best. —*Observer.* [8

Royal Insurance Company.
HEAD OFFICES:
LONDON: ROYAL INSURANCE BUILDINGS, LOMBARD STREET.

J. Shuttleworth, Esq., Deputy Chairman A.H.C.

TO EXHIBITORS.

Contributions of Skilled Workmanship or Amateur Productions will be accepted from all parts of London, the Provinces, Scotland, and Ireland.

PRIZES,

regulated in value according to the success of the undertaking, will be awarded for the most meritorious productions.

THE SALE OF ARTICLES

exhibited will be especially encouraged, and the price, if desired, may be affixed to the objects. An office will be opened in the building for the transaction of this business.

THE GREAT HALL,

the largest in London, will be fitted up for the display of industrial objects, no charge being made to exhibitors for occupying space.

SMALL WORKSHOPS, WITH AND WITHOUT STEAM POWER,

will be fitted up round the building. These will be let, under special arrangement, to persons who may desire to manufacture and sell articles during the Exhibition.

THE MINOR HALL

will be fitted up as a Picture Gallery and Fine Arts Court, furnished with chairs and tables, and supplied with the Daily Papers, Magazines, &c., for the accommodation of visitors during the day.

A LECTURE HALL

will be constructed, capable of accommodating about 3,000 persons. This will be devoted to the following, among other purposes:—

LECTURES.

The delivery of a series of lectures upon subjects of interest, in harmony with the object of the Exhibition.

CONVERSAZIONE, &c.

It is contemplated to grant the use of the Lecture Hall to Trade and other Societies, for the purpose of enabling workmen to invite employers or friends to conversational meetings; also, under special conditions, to Amateur Musical Associations.

FLOWER SHOW.

Facilities will be afforded for holding a Flower Show, in connection with the various existing Amateur Horticultural Societies in the Metropolis. Early application from societies is solicited.

A TEMPORARY GARDEN.

It is contemplated to lay out a space of open ground adjoining the Hall as a small garden. This will afford an opportunity for the proper exhibition of terra cotta borders, rustic seats, &c.

SCHOOLS.

It is intended to invite the whole of the school children in the Metropolis and adjacent districts to a free inspection of the Exhibition.

CHORAL SOCIETIES

have already offered their services, and arrangements will be made for several very numerous musical gatherings, similar to those which attracted so much notice during the Exhibition of 1864.

ART AND INDUSTRIAL UNION.

In order to facilitate the sale of articles which Exhibitors may desire to dispose of, application will be made to the Board of Trade for special authority to legalise the issue of shares in the same manner as that adopted by the various art unions now in existence.

FORMS OF APPLICATION FOR SPACE

may be obtained by sending a stamped and directed envelope to the Secretary, Mr. W. J. Watts, 7, Birchmore Terrace, Cardington Street, Hampstead Road, London, N.W., or by application to the following

HONORARY AGENTS.

Birmingham—Mr. Christie & Mr. Richards, the Free Library.
Camden Town—Mr. Weston, 78, Camden Street; and Mr. Porter, Upper College Grove.
Clerkenwell—Mr. Linfoot, 21, Sidney Street, Goswell Road.
Daventry and Weedon—Mr. Bird, Weedon.
Deptford—Mr. Dunham, 3, Woodpecker Lane, New Cross.
Dublin—E. H. Wadge, Esq., 12, Grafton Street.
Holborn—Mr. Allard, 38, Fetter Lane.
Holloway—Mr. Mummery, 5, Railway Place; and Mr. Phillips, 80, Sussex Road, Seven Sisters Road.
Hoxton—Mr. Morgan, 195, New North Road.
Hull—Mr. Scotter, Manchester and Sheffield Railway Station, Hull.
Islington—Mr. Healey, Cooperage, Islington Green.
Lambeth—Mr. Burgess, 4, Upper Marsh.
Manchester—Mr. Haigh, Workman's Institute, 220, City Road.
Plymouth—Mr. Wright, Workmen's Association, Catherine Street.
Portsmouth—Mr. Cook, Borough Workmen's Club.
St. John's Wood.—Mr. Burnham, 8, Ordnance Road.
Warrington—Mr. A. Mackie, *Guardian* Office. [12

"An interesting and instructive story by a very able pen."—*Evangelical Magazine.*

JACKSON, WALFORD, & HODDER, 27, Paternoster Row.

SIX GOOD REASONS FOR TAKING IN

"Merry and Wise" for 1866.

1. Because it will contain Mr. W. H. G. Kingston's New Serial Story, "Washed Ashore."
2. Because it will contain Old Merry's Tour in Switzerland.
3. Because a fine Coloured Picture will appear in the January and July Numbers.
4. Because the Toned Paper and numerous Engravings will render it one of the handsomest Christmas Volumes.
5. Because Mr. Edwin Hodder, Mrs. Bickerstaffe, "Old Merry," Nelsie Brook, R. Hope Moncrieff, and other writers, will contribute to make its pages valuable and interesting.
6. Because it will be enlarged to Fifty-Six Pages in January, without increase of price.

Price 3d. Monthly. May be had of any Bookseller.

JACKSON, WALFORD, & HODDER, 27, Paternoster Row.

CAPITAL PRESENT FOR THE YOUNG FOLK.

Old Merry's Annual for Boys

and Girls. With Coloured and numerous other Illustrations. Elegantly bound in richly gilt cloth, gilt edges, 5s.

JACKSON, WALFORD, & HODDER, 27, Paternoster Row.

On Health. What Preserves,

What Destroys, and What Restores It. With Ten Engravings. In Ten Letters to a Non-Medical Friend. By JONAH HORNER, M.D. Third Edition, crown 8vo, cloth limp, price 2s.

"Remarkably fitted to be useful."—*British Standard.*

Educational Works of Dr.

CORNWELL, F.R.G.S.

"A very useful series of Educational Works, of which Dr. Cornwell is either author or editor. It [THE GEOGRAPHY FOR BEGINNERS] is an admirable introduction. There is vast difficulty in writing a good elementary book, and Dr. Cornwell has shown himself possessed of that rare combination of faculties which is required for the task."—*John Bull.*

MAP BOOK FOR BEGINNERS. Consisting of Twelve Pages of Maps (above Seventy large and small). Price 1s. 6d.; 2s. 6d. coloured.

BOOK OF BLANK MAPS. The above Maps complete in all but the Names, to be filled in by the Learner. Price 1s.

BOOK OF MAP PROJECTIONS. The Lines of Latitude and Longitude only to the above Maps. Price 1s.

GEOGRAPHY FOR BEGINNERS. 19th Edition, price 1s.

A SCHOOL GEOGRAPHY. 37th Edition, price 3s. 6d.; or with Thirty Maps on Steel, 5s. 6d.

"Without exception the best book of the class we have seen."—*Atlas.*

A SCHOOL ATLAS. Price 2s. 6d., or 4s. coloured.

*** Recent Geographical Discoveries and changes are embodied in the current editions of the above Works.

ALLEN AND CORNWELL'S SCHOOL GRAMMAR. 35th Edition, price 2s. red; 1s. 9d. cloth. With very Copious Exercises and a Systematic View of the Formation and Derivation of Words; together with Anglo-Saxon, Latin, and Greek Roots, which explain the Etymology of above 7,000 English Words.

THE YOUNG COMPOSER; or, Progressive Exercises in English Composition. 28th Edition, price 1s. 6d.

KEY TO THE YOUNG COMPOSER. With Hints as to the Mode of Using the Book. Price 3s.

GRAMMAR FOR BEGINNERS. 46th Edition, price 1s. cloth; 9d. sewed.

SELECT ENGLISH POETRY. Edited by the late Dr. ALLEN. 13th Edition, price 4s.

DR. ALLEN'S EUTROPIUS. With a Complete Dictionary. New Edition, 3s.

THE SCIENCE OF ARITHMETIC. A Systematic Course of Numerical Reasoning and Computation, with very numerous Exercises. By JAMES CORNWELL, Ph.D., and JOSHUA D. FITCH, M.A. 9th Edition, price 4s. 6d.

SCHOOL ARITHMETIC. By the Same. A First Book of Practical Arithmetic, with an Inductive Explanation of each Rule, and containing numerous Questions for purely Mental Calculation. 7th Edition, price 1s. 6d.

KEY TO SCHOOL ARITHMETIC. With numerous Suggestions, Special and General, for Teaching Arithmetic. Price 4s. 6d.

London: SIMPKIN, MARSHALL, and Co.; HAMILTON, ADAMS, and Co. Edinburgh: Oliver and Boyd. [14

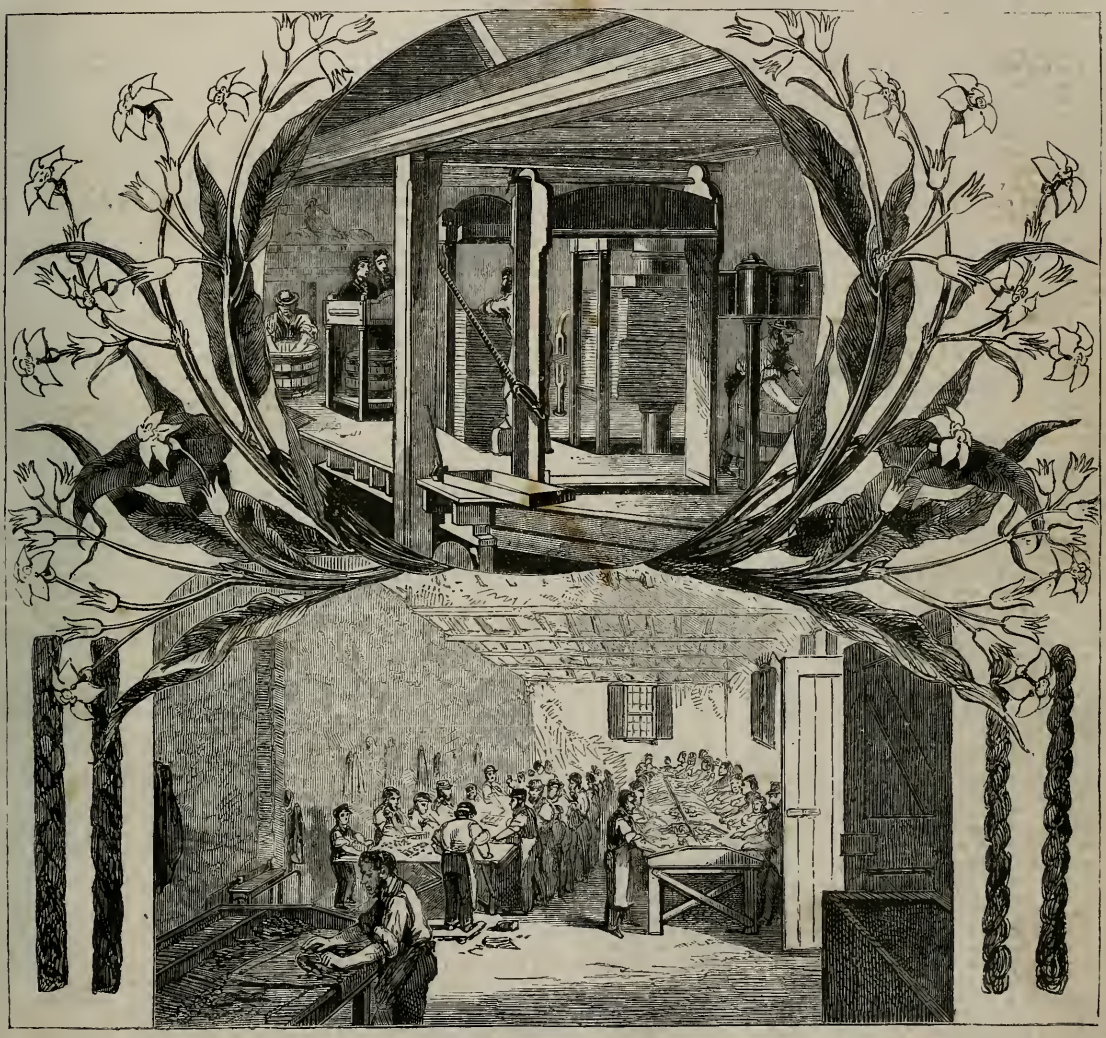
THE WORKSHOPS OF THE WORLD.



THE MANUFACTURE OF TOBACCO.

An Australian Tobacco Manufactory.

AUSTRALIA is slowly but surely developing the germs of what bids fair to prove ultimately a vast and apparently inexhaustible *manufacturing* power. The same causes which have transformed the once calm and peaceful forest regions of America into crowded and ever-busy hives of industry, where the looms seem to be in perpetual motion, and the forges are seldom allowed to cool, are also in full work at the Antipodes. The first difficulties of colonisation—difficulties aggravated by the mischievous results of the transportation system—were no sooner got over, and something like a tolerably fair estimate formed of the productive powers of the soil, than the settlers directed their attention to the encouragement of such manufactures as appeared to hold out reasonable hopes of becoming permanently successful; but, for a time, the comparatively cheap rate at which manufactured goods could be supplied from the mother country, combined with the high price of labour in New South Wales and its sister colonies, seemed to prevent the idea of Australian manufacturing industry from becoming realised. Time and perseverance, however, work wonders. Like the inhabitants of the United States, the Australians felt their energies rise in proportion to the magnitude of the obstacles which impeded their progress, and by the exercise of no mean amount of inventive power, and the adoption of improved mechanical appliances, they have at last managed to accomplish their desire, and to take their stand in the field of manufacturing industry. New South Wales, South Australia, and Victoria, each have their peculiar manufactures. In the first-named colony, horse, wind, and water-mills are gradually

giving way to steam. In 1852 there were 72 steam-mills for grinding and dressing grain; in 1862 there were 131. In 1853 there were 141 manufactories or works conducted by machinery; in the ten years ending with 1862 they had increased to 859.

It is, however, of the tobacco manufacture that we wish more immediately to speak. This, so far as New South Wales is concerned, appears to have taken a great start since the outbreak of the American War—an event which, by lessening the supply of manufactured material, greatly relieved the Australian tobacco manufacturer from the effects of competition. In 1861, the production of Australian manufactured tobacco amounted to 1,587 cwt. In the succeeding year it had increased to 3,755 cwt. The introduction of the manufacture into New South Wales, was mainly attributable to the exertions of Mr. Dixson, who emigrated to Australia some twenty-five years since for that express purpose, although, until about three or four years since, he found himself unable, by reason of the excessive duties levied on the raw material, to carry out his cherished design. The lowering of the tobacco duty led him, in July, 1862, to commence the fitting up of his manufactory, in which, at the present time, about sixty persons are employed, the quantity of tobacco turned out weekly being over two tons. This may appear somewhat small to those accustomed to the vast establishments found in this country and on the Continent; but it must be remembered that the Australian tobacco manufacture is as yet in its infancy.

The manufactory, which is at Sydney, is described as being very interesting. The operations commence in a damp cellar, where the leaf is carefully emptied out of the hogsheads, and received by boys, who separate the various leaves, and strew them over the floor. When the floor is fully covered with a layer of leaves, water is sprinkled about in all directions, until the leaves become damp, when a fresh layer is placed upon them, and the watering process repeated. This is carried on until the various layers have attained a thickness of about two feet. When the material has become sufficiently moist, it is carried into the upper rooms, where it passes through sets of three hands each, consisting of men and boys of about fifty in number. Each set of three is provided with a roomy table, ledged round on three sides. The first hand takes up the leaves and opens them out. The second takes the leaves thus prepared, and places them one by one on each other, in such a way that they overlap. He then rolls them into strands about eighteen inches in length. The third takes one of these strands, which resembles a piece of tarred rope, and doubling it up in the middle, dexterously twists it ropewise by rolling it under the palms of his hands, which must be soft and delicate. Then, nipping off the tapering ends, he tucks the stumps into the coil, and the "fig" of tobacco, so far as manual labour is concerned, is complete.

The tobacco thus prepared is next subjected to powerful hydraulic pressure—the presses being made of the best Lowmoor iron, by which the "figs" are considerably flattened and reduced in thickness. They are then placed in tierces, made from the *silky oak*, and hooped with thick iron. The tierces themselves are surrounded by a casing of loose iron-bark staves, an inch and a half in thickness, round which are placed thick truss-hoops of English iron. As soon as the tierce is full, it is placed in the press, and pieces of wood, in size and shape like large grindstones, and fitting exactly to the inside of the tierce, are placed at the top of the tobacco, which is then subjected to a pressure equal, at least, to 500 tons, by which means it is compressed into a close, solid, and compact mass. The pressure is then removed, and more "figs" added, when the pressure is again applied, the process being repeated again and again, until the tierce is filled, and ready for heading up. The tobacco has next to be *sweated*. The sweating-room is entered by creeping through two small double doors, and is a large, dark apartment, with thick brick walls and iron ceiling, heated by a furnace to a high temperature, and traversed by a floor consisting of joists only, without boards. On this floor the tierces are laid, and for four, five, or six weeks, according to circumstances, they remain subject to a constant and uniform heat, the furnace being kept burning day and night. This imparts a black colour to the tobacco. After going through this process, the tierces are allowed a week to cool, when the tobacco is ready for the market. In a separate establishment a number of girls and young women are employed in the manufacture of cigars, for which a ready sale is found in the colony.

Paris Exhibition of 1867.

THE forthcoming Industrial Exhibition at Paris will be emphatically a Working Man's Exhibition, and it will be advantageous to every skilled artisan to thoroughly inform himself of every particular regarding its plan, purpose, and organisation. We shall duly report in these pages every particular of progress that comes under our notice.

The Imperial Commission has lately been much occupied with the consideration of the means of securing the best possible illustrations of those industries which depend entirely, or principally, on manual labour, skill, and taste. Every effort is being made to give to that department which in 1862 was called the Process Court, great extension and importance, not only as respects French exhibitors, but those of all parts of the world.

The Imperial Commission will take upon itself the charge of the French artisans, and will leave to the Foreign Commissions the superintendence of their own countrymen, while special arrangements are made for the reception and superintendence of such other artisans as do not fall under either of these heads, who belong to countries only partially civilised, and not officially represented in the Exhibition.

First, as regards French workmen, it is proposed that they shall be admitted, in some cases, on their own application, and in others, under the superintendence of a master, foreman, or delegate appointed by themselves. The Commission leaves to employers, local societies, and others, the charge of indemnifying the workmen under their care, and providing the means for their journey to and from the Exhibition, and for their maintenance during their stay in Paris; but it will afford facilities for the sale of the products of these industries, and thus partially, if not entirely, provide for the expenses incurred. The goods produced within the Exhibition, and within certain limits, and others from the same source, will be allowed to be sold either on the spot where they are produced, or in the bazaars which each country will be permitted to erect within the portion of the park allotted to it. In cases, however, in which the products are not saleable, the Imperial Commission is prepared to co-operate with the Foreign Commissions or other representatives, and to contribute towards the support of the work provided, if it considers the object of sufficient importance to warrant the sacrifice. Another inducement held out by the Commission is that, in addition to medals awarded by the jury for superiority of workmanship, certain recompenses will be bestowed upon those workmen who exhibit the most remarkable aptitudes.

As regards the industries to be admitted to the Exhibition, the only exceptions made are those of which the material or the processes employed are disagreeable, unwholesome, or dangerous, and those which require too much time for their development to allow them to be fully illustrated in a conveniently short space of time. It is understood, however, that a certain amount of originality, superiority, or special ingenuity will be demanded as the necessary qualification for admission; or, in other words, that the industry to be illustrated shall have a claim upon general attention.

In the classification of the workmen and industries, the Commission adopts the expressions *European* and *non-European*—the former including not only those actually placed in Europe, but those whose civilisation raises them to the European standard, while the other title designates the opposite. In the list of European industries which it is desired to see represented in the Exhibition, we have:—First, the class which works with the aid of machinery; we find, besides the great branches of manufacture, sewing and embroidery by machinery, the manufacture of boots and shoes, envelopes, medals, confectionary, ice, chocolate, metallic pens, thimbles, nails, pipes, fish-hooks, capsules, needles, pins, pencils, bricks, tiles, &c.

In the second class, that of products in the manufacture of which manual labour competes with machinery, such as the making of thread, string, rope, tissues, needlework, netting and knitting, printing of all kinds, the making of shawls, carpets, tapestry, embroidery and lace, corks, wooden shoes and clogs, rustic furniture, trellis-work, the woodwork of lucifer-matches, hand-made paper, bookbinding, basketwork, button-making, brush-making, the casting of shot, &c.

The third class, that in which the excellence, dexterity, intelligence, and taste of the workman are peculiarly conspicuous, and which have exhibited the greatest success in resisting the concurrence of machinery, is divided into three sections:—

1st. That which will be comprised within the Exhibition building itself, as the manufacture of the tapestry and carpets of Aubusson and Beauvais; the making of designs and the preparation of the cards for the Jacquard loom; hand-lace making and embroidery; the making of artificial flowers and fruits; working in feathers, pearls, spun glass, &c.; fabrication of articles of clothing and small wares; working in the precious metals, and ornamental occupations—such as engraving, chasing, niello and damascene work, inlaying, incrustation; carving in wood, ivory, and metals; illumination and colouring on wood, stone, metal, paper, silk, and other materials; decorative painting on porcelain and panel; engraving on glass, gems, shell, copper, zinc, steel, stone, and wood; typographic and telegraphic composition; the polishing of lenses, and the construction of mathematical and philosophical instruments.

2nd. Works requiring the aid of fire, and which are to be grouped around sources of motive power in the park—such as the making of pottery, porcelain, glass; enamelling and filagree work, gold-beating, works in the precious metals, in which the aid of fire is required; casting and working in bronze and other metals.

3rd. Agricultural and horticultural industries; photography, &c., in the park, or in places set apart for experiments and competition. The rearing of silkworms, the distillation of essences and perfumes, farming and other employments, occupying families, or numbers of persons, will each, as far as possible, have separate establishments for their accommodation, in order to exhibit them under their ordinary aspects.

The class of *non-European* occupations presents greater novelty and, at the same time, greater difficulty. The Commission has, however, received important tenders of assistance with respect to this class, which encourages a hope that a portion, at least, of the manual operations little known to the European world will be represented at the Exhibition. In order to induce workmen and families from remote parts of the world to come to Paris, and pursue their occupations during the time of the Exhibition, and with the necessary submission to its rules, as well as to the habits of the European world, the Commission depends partly on the assistance of Foreign Commissions, and partly on the aid of missionaries and merchants. As regards the missionaries, it is expected that they will be able to induce some of their converts to accompany them to Paris, and also to superintend and arrange for their maintenance while there, either in the houses of the missions, or in special apartments, adapted to the habits and necessities of each family or party, and the Commission, in all such cases, is prepared to undertake all the costs. It is hoped that this arrangement will create within the limits of the Exhibition a certain number of native groups, the study of whose habits, manners, and methods of working will be not only useful in an industrial point of view, but offer, also, valuable means of ethnological information. The same means of disposing of the productions of these strangers will be accorded as have already been mentioned with reference to European workmen.

The Commission hopes to present to the view of Europe—Laplanders making fishing-tackle; Ural Tartars employed in the preparation and ornamentation of skins and carpets; the Kabyles of Algeria making the glazed pottery of Bjedjera, carvings in the wood of the fig-tree, ornaments in silver and coral, and carpets of Oran and other districts; natives of Morocco weaving silk, cotton, and woollen fabrics, making fez caps, saddles, and arms, and preparing shagreen; negroes of Soudan producing cotton cloth, morocco work, and pottery; the half-castes, or *Petits Blancs*, of the Isle of Bourbon making sacks for sugar and coffee; Anatolians weaving Smyrna carpets, silks, and cloth of gold; Syrians

fabricating tissues and arms of Damascus, Aleppo, and Lebanon, mother-of-pearl work of Bethlehem, and gold work of Beyrout; Persians at work on Kurdistan carpets, silk embroidery, Kirman shawls, and silks and cottons of Yerd, enamelled tiles, and damascened arms; Indians weaving muslins, embroidering cashmeres, engraving ivory and wood, and twisting threads of gold into bracelets and other ornaments; Cambogians fabricating boxes and toys from sandal wood; Siamese carving rhinoceros horn; and, perhaps, Chinamen carving a nest of ivory balls; Japanese painting their incomparable lacquer wares; Mexicans turning their perfumed pottery; and redskins composing head-dresses of feathers and bead-embroidered mocassins.

Nearly the whole of one side of the building and of the park are devoted to France. Great Britain occupies that portion of the other side which is nearest the chief entrance, namely, that which faces the river. The amount of park space allotted to her is very large, and it is hoped that her model farms and cottages, agricultural machinery and produce will form a very attractive portion of the Exhibition.

THE WORKING MAN.

BY JOHN PLUMMER.

I'll sing you a bran-new song, that was made by a queerish pate,
Of a sturdy English working man in years now out of date—
How his heart, undaunted, proudly bore against his bitter fate—
How with a word of hearty cheer he comforted his mate,
Like a true-born English working man, one of the olden time.

His home so poor was thatched with straw, to ward off rains and snows,
But fagots he had very few to warm his frozen toes;
Yet cold and frost were vain to quench the flame that burning rose
Within his breast as e'er he sang—"In fight fear not the blows,"
Like a true-born English working man, one of the olden time.

His heart was stout, his arm was strong, and both could do and dare;
A heart and arm that in the fray shirk'd not their daily share:
A bright, clear eye that smiled alike in storm or sunshine fair,
A soul that hardships fearless scorned, nor shrank the cross to bear—
Like a true-born English working man, one of the olden time.

But there were hours when he would dream of brighter days to come,
When Plenty's golden smile should bless the workman's lowly home,
And songs of happy children swell through heaven's wide azure dome;
And as he dream'd, with firmer step he trod the sullen loam,
Like a true-born English working man, one of the olden time.

He saw the gates of knowledge ope'd, and, through the portals wide,
The student and the working man, calm, enter side by side;
He saw his mates—the lords of toil—forth in their greatness stand,
The envy of surrounding climes, the glory of their land—
Each a true-born English working man, one of the modern time.

Men, be it ours, the noble aim, to speed this wish'd-for day,
When from the weary workman's path the clouds shall pass away,
To dark no more his onward course of peace, and hope, and love;
Let each of us raise up our hearts and ceaseless strive to prove,
Like this true-born English working man, one of the olden time.

NEW HYDRAULIC CEMENT.—M. Henri Sainte-Claire Deville announces that a very valuable hydraulic cement may be obtained by heating dolomite,—the abundant native double carbonate of magnesium and calcium, commonly known as "magnesium limestone,"—to between 570° F. and 750° F., and then making it into a paste with water. The heat to which the dolomite is subjected should be above 570° F., but should not exceed 750° F.

History of the Working Men's College,

45, GREAT ORMOND STREET, QUEEN'S SQUARE, LONDON.

BY WILLIAM ROSSITER, SENIOR FELLOW OF THE COLLEGE.

I.—THE ESTABLISHMENT OF THE COLLEGE.

ALL who remember the year 1848 will also recollect the Chartist meetings of the earlier part of it, and especially the great meeting of the 10th of April, when the great body of London tradesmen enrolled themselves as special constables, to keep in check a physical force display made by a crowd of men said to be mostly ignorant and all dissatisfied.

But, besides these thousands of well-to-do tradesmen, some few other men thought they might possibly be able to do something towards preserving order and peace by finding out, in some degree, why these manual workers were dissatisfied—whether they were really so ignorant as not to know how contented and happy they ought to be; or whether they had any real grounds of complaint, and, by reason of their ignorance, knew how to look for other than a physical force remedy.

These few men founded, in the year 1854, "The Working Man's College." During the six years between 1848 and 1854, they worked quietly but steadily among various classes of London working men, making themselves familiar with their ways of life, their thoughts and feelings.

The following extract from an article in *Fraser's Magazine* for January, 1850, written by one of these men (J. M. Ludlow, Esq.), will show what they found. Speaking of letters on the same subject in the *Morning Chronicle* of that date, he says:—

Strange and sad, indeed, are the pictures which these metropolitan letters exhibit, drawn from God's own storehouse of fact—stranger, sadder, terribler than all fiction. Look at the Spitalfields weavers, "formerly the only botanists in the metropolis," possessing, within the memory of living man, an Entomological Society, a Horticultural Society, an Historical Society, and a Mathematical Society—all maintained by the operatives—bringing forth a Dollond, a Simpson, and an Edwards; and then, in the course of this very half century, seeing their wages cut away from them year after year, falling from 14s. 6d. (average) in 1824, to 7s. in 1839, and to 5s. 6d. in 1849; till the second and third-rate weavers are found living twenty persons in a house, tasting sometimes animal food once a month. Look at the three thousand labourers scuffling every morning at the London Dock-gates for a single day's hire of half-a-crown; at the slop-work tailors—the men receiving 3s. 6d. for the coats they made at 5s. 1d. two years ago—sometimes eating, drinking, sleeping, working in one room, as many as ever the room will contain. . . . If only the food and other necessary articles purchased by these were cheap and wholesome! But the reverse is the case. It is shown that among the street hucksters—the great purveyors of the poor—the pound-weight of the costermonger, or street vendor of vegetables, fruit, and fish, "is mostly deficient four ounces, and frequently eight or ten ounces; that the pint measure is at least one-third short; that the fish supplied to them is generally what is called 'rough,' or, in other words, two or three days old before it is bought, and frequently putrid when sold by them to the poor; and, moreover, that they almost invariably borrow the capital with which they purchase their goods, and pay interest at the rate of nearly 1,000 per cent. for the money."

This was the condition of a great number of the working men of London, to say nothing of the women, who toiled as many hours as they could keep their eyes open, receiving in return wages varying from 3s. 6d. to 1s. 3d. per week.

These facts were made patent to the world by means of the *Morning Chronicle* and *Fraser's Magazine*, and the world, full of benevolence and thoughtlessness, more ready to give money than care, set charity to work to relieve the distressed workers; forgetting that this charity relieved the employers rather than the employed, by enabling the latter to work for lower than living wages.

Others, with more of thought, but no less of charity, looked to emigration as a remedy, and so it proved; but to those who went rather than to those who remained. Many who did not emigrate would have done so but for want of energy, of means, or of knowing how to go about it.

The men who afterwards founded the Working Men's College also gave both money and thought towards the doing away with the system of starvation wages. But they determined to try no great experiment—to put forth no universal nostrum; but to attempt, on a small scale, entirely under their own control, the experiment whether the men whom they sought to help could in any way raise themselves in their trades rather than out of them—whether there was no way by which, without leaving their country, they could earn, if not a comfortable, at least a decent living. To quote again the article in *Fraser's Magazine*—

There appear to be two means by which the working man can peacefully and successfully contend against the two-fold evil of the low wages which he receives for his work, and of the high prices he has to pay for his food and other articles of consumption. These two are Co-operative Stores on the one hand, as a means of cheapening the consumption of the worker, Associative Labour on the other, as a means of raising his earnings, by transferring to labour and skill the profits hitherto monopolised by capital, after a due hire shall have been paid for its use.

It was proposed to try these co-operative and associative systems, not as a grand empiric for all social diseases, but on a small scale as experiments, which, if they failed, should do but little if any harm; but which, if successful, might be the germ of a great and lasting good to the working man, by enabling him, not to escape from his place in London work, but to recover and keep his right place therein; to help him in the only real way, by helping him to help himself.

The writer of the article in *Fraser*, writing two years later (1852), says:—

A society for promoting Working Men's Associations has been set up, and has served as a centre to bring various classes together, clergymen and lawyers, medical men and men of science, noblemen and capitalists, with tailors and shoemakers, with needlewomen and printers, and plasterers and bakers, and silk-weavers and working engineers, and others whom space would fail me to number. And those clergymen and lawyers, those medical men and men of science, those noblemen and capitalists, have gone to the working men, not to make a profit out of them, but to help them to make profits themselves; not to rule over them, but to enable them to govern themselves; not to bestow upon them ostentatious alms, but to help them by advice and assistance, and by money lent, not given, to raise themselves and their children above the need of alms.

The experience of this society for promoting Working Men's Associations during the six years 1848-53, showed daily more and more the necessity of the working man being educated. No one was more conscious of this than the working men themselves, and it was decided that the attempt should be made to provide some means of education for the associates of the various Co-operative Trades' Associations. The problems to be solved for the long existence of these associations, were problems of political and social economy—problems concerning the very essence of society generally. Zealous hard work the men brought for the motive power; but practical wisdom to steer aright was not so readily found.

What should be the nature of this education? The Principal of the college thus expresses his idea of a "National Education:"—

A feeling has been for some time at work in our land which may be interpreted thus: "All ages have been wanting to be informed concerning the mysteries of their own being—wanting to have the riddle of the world solved to them—wanting to know what they are, and whence they came, and whither they are going." A cry has been raised, Give this information to us and to our children. Refuse it to us, if you are willing to try the might which there is in human nature, blind and ignorant of all the conditions under which it exists. . . . Such a voice as this, uttered from the depths of a nation's being, may, perhaps, help us more in finding out that principle of which we have been so long in search, than many suggestions from ingenious and learned men. A mere education of restraint (such as the Spartan system) will not satisfy this cry; and yet it seems to indicate feelings which may well need much restraint. A mere education of the faculties (such as the Athenian system) will not satisfy it; and yet it seems to indicate the presence of faculties which must need to be called out. A mere education of information about facts and opinions will not satisfy it; yet it seems to crave for information about the deepest facts. This, I think, and nothing short of this, would satisfy it. If, at any time, it should be proclaimed that God himself is the great cultivator of humanity in men; that he has appointed men to co-operate with him in the work; that there is an order for carrying on this cultivation; that all peculiar faculties, all nature, all influences of society—above all, that great bond of society, language—are instruments ordained by Providence to help us in it.

It was finally resolved, early in 1854, that the

society for promoting Working Men's Associations should make an attempt to provide an education of this kind for the working men of London. Several meetings were held, and the following was agreed to be taken as the fundamental theory of the Working Men's College:—

1. The position of the founders as members of a society which affirmed the operations of trade and industry to be under a moral law—a law concerning the relations of men to each other—obliged them to regard social, political—or, to use a more general phrase—human studies, as the primary part of the education in the college.

2. They were not bound to confine their education to the associates of the society; but should promote their interests better by producing a scheme which should be available for the working classes generally.

3. Adult males (not younger than 16) were to be contemplated first and chiefly in the setting up of the college; but it was very desirable that provision should, in due time, be made for the teaching of boys and of females.

4. The education offered by the college was to be regular and organic—not taking the form of mere miscellaneous lectures, or even of classes not related to each other.

5. The teachers, and by degrees the pupils, were to form an organic body; so that the name of "college" should be at least as applicable to the proposed institution as to University College or to King's College.

6. The college was, in some sense or other, immediately or ultimately, to be self-governed and self-supported.

The house, 31, Red Lion Square, was taken, and the college began work on October 31st, 1854. The Principal, Rev. Frederick Denison Maurice, M.A., then Chaplain of Lincoln's Inn, gave an inaugural lecture, on the previous evening, at St. Martin's Hall.

(To be continued.)

Health of Body and Mind.

A new word has recently been adopted into our language from the French, because there is no English word that conveys the same meaning. This word is *hygiène*, or the art of preserving the health.—*Sanitary Science.*

PREVENTION is better than cure in evils of every kind, and especially as regards disease. To every one health is the greatest of blessings; deprived of it, the life even of the most affluent and exalted in social position is but a dreary waste. To the working man, whose family is dependent on his ability to get through a day's work, health is doubly precious, for without it poverty and privation, with all their attendant evils, set in, and inflict immeasurable suffering and injury upon his children, through insufficient food and clothing, and defective education. And to these evils another is almost sure to be added—that of being compelled to inhabit a confined and unwholesome dwelling.

This word *hygiène*, then, is one that has strong claims upon every prudent working man's attention, and it is his duty to make himself acquainted with all the matters comprehended in it. And he must not defer doing this until he has fallen sick. He may, it is true, have his sick club or his benefit society to fall back upon; but this reliance ought not to lead him to neglect every means of preserving his health.

The causes of disease are many, and extremely insidious. There are infectious diseases and contagious diseases, which no foresight can guard against; but if every one understood the laws of health, and the nature of the agencies whose operations generate them, those diseases would diminish, and, probably, soon disappear. The history of disease shows satisfactorily that many plagues, due to the prevalence of filthy habits and vitiated air, have given way before improved cleanliness and ventilation. Where they still prevail it is through ignorance or neglect of the laws of hygiene.

Many persons place great reliance upon the resources of medicine: they rashly invite disease, and trust to the doctor to cure them. This reliance makes people careless, and unmindful upon how slender a thread life hangs. Those who know how uncertain the healing art is in its operations, avoid this folly. Aware how frail a thing a damaged constitution is, they will so live as to render the assistance of the healing art as unnecessary as possible.

It is admitted that a person born with a sound constitution, and carefully nurtured during infancy and youth, ought to grow up a healthy, robust individual, and that, if he leads a sober, temperate life, he may attain a vigorous old age without experiencing much, if any, serious illness. M. Flourens, the eminent French physiologist, argues that one hundred years is the span of man's life, and that if one person can attain to that age, or more, the majority might do so likewise, if they observed the laws of hygiene.

The commonest causes of disease are found in some kind of imprudence or other, such as errors in diet, intemperance, or exposure to cold and wet: these are avoidable causes. The unavoidable causes are foul air, adulterated and unwholesome food, and polluted water.

But before entering upon the subject of hygiene, properly so called, it is necessary to say a few words on the moral and physical constitution of man, and to show that his twofold nature necessarily demands a twofold influence for the complete development of his being.

Man's body is a wonderful compound of organs, allied together not only by the continuity of their parts, but also and especially by the harmony of the functions they perform. From the hour of birth up to a certain age, these organs grow and develop themselves by an innate power, and by the same influences which sustain life throughout its entire duration. These influences, upon which physical life depends, are the sum of the conditions amid which we live, the principal of which are food, air, and light, supplied by nature, or fashioned by human industry and skill. We are nourished by air as well as by bread: that is to say, the body, by the internal action of its organs, appropriates the one as well as the other, converting each into its own substance. Anatomy, by its details, makes known to us the instruments of this appropriation. Physiology explains the mode by which this transformation and the other functions of the body are accomplished. Hygiene teaches man how to make the best use of the things necessary to life, in order to secure its regular development.

On this last point man's instinct, it might be supposed, ought to render the teachings of science unnecessary. It would be so if man were a piece of pure mechanism, or if, like the inferior animals, he possessed only organs with appetites regulated by an infallible instinct. But though, like them, man has a body, and is subjected, like them, to purely material wants, to which correspond, in nature, the things proper to satisfy them, he has also within himself a power distinct from matter—thought; the sentiment of good and evil, the soul. This power opposes itself to his material nature, and, when ill-directed, leads to every abuse of life, and degrades man below the *mere* animal, whose unerring instincts preserve it from this peril, at least.

The History of an Industrial Exhibition.

TOWARDS the latter end of January, 1865, the members of the Preston Working Men's Club, having heard of the large measure of success which had attended the establishment of Working Class Industrial Exhibitions in various parts of the country, held a meeting for the purpose of considering the feasibility of an industrial exhibition in Preston. They thought, and rightly too, that taking into consideration the large number of working-class families inhabiting the town and out-lying districts, the generally intelligent character of the working men themselves, and the paucity of rational modes of recreation provided for them, a well-organised exhibition would possess greater chances of success than in most other manufacturing towns. But it was not so easy to imbue others with the convictions entertained by themselves, and for a few weeks the project appeared to languish, although the local press had spoken earnestly in its favour. Much of this apathy was doubtless attributable to the circumstance of its having been at first intended that all profits derived from the exhibition should be applied to purposes connected with the Working Men's Club. It soon became apparent that if the exhibition was to be held at all, the promoters would have to devise some practical means of enlisting a larger amount of public sympathy and co-operation on their side, and hence it was finally decided at another meeting, held in March, to accept an offer made on behalf of the Avenham Institution for the Diffusion of Useful Knowledge—the Mechanics' Institute of Preston—and to form a committee, composed of the committees of the Working Men's Club and the Avenham Institution, for the purpose of starting the exhibition, all profits to be equally divided between the two institutions.

Thenceforth matters became simplified. It was seen that the committee were in earnest, and on the 22nd of March, the Mayor of Preston was appointed chairman of the committee. Almost immediately after this the Preston Corporation generously granted the loan of the Corn Exchange for the purpose of holding the exhibition—a step which was followed by the formation of a guarantee fund of £500, nearly all of which sum was promised amongst the committee themselves, thus proving their faith in the success of their undertaking. An appeal to the general public resulted in the increase of the guarantee fund to about £2,000, after which the committee set about the task of collecting articles for exhibition, in which they were ably assisted by many of the exhibitors, and by the leading inhabitants of the neighbourhood; and on the 21st of September last the exhibition was formally opened, the occasion being signalised by a general holiday in the town, the various local bodies and trade societies taking part in the procession which accompanied the municipal authorities and gentlemen assisting in the opening ceremonial.

The contents of the exhibition did not differ materially from those of other exhibitions, except in the increased number of models, specimens of raw material and machinery, and samples of finished products connected with the cotton manufacture—the local industry of the town and vicinity; but the Art department was enriched by the loan of many valuable paintings, while the Natural History and Antiquarian divisions showed how plentiful were the materials for a local museum. The chief interest of the artisan-visitors was, however, centred in that portion of the exhibition devoted to models; and it was both interesting and instructive to note the critical air with which a group of thoughtful-featured, rough-handed working men would attentively examine any new model or invention which attracted their observation. With the instinct of true handicraftsmen, they speedily perceived any defects or advantages possessed by it, and then proceeded to pass judgment upon the next object of notice. The popularity of the exhibition was considerably enhanced by means of judiciously-arranged concerts, lectures, scientific entertainments, &c., and by affording working class visitors every possible facility for inspecting—at the least possible expense to themselves—the details of the collection thus industriously formed. At first there was some fear that the good-will and harmony which prevailed amongst all classes would be disturbed, in consequence of several of the most active promoters of the exhibition objecting to the sale of alcoholic liquors at the refreshment stalls; but, somehow or another, peace was restored, and all went "merry as a marriage bell" until the close of the exhibition last month. During the period that the exhibition remained open, the *Preston Exhibition Gazette*, a small journal printed in the exhibition, was published at regular intervals, and met with much favour.

The number of persons visiting the exhibition, during the three months it remained open, was 200,050. The total receipts from all sources amounted to £4,710; the expenditure, £2,510; leaving a net balance of *two thousand two hundred pounds* to be divided equally between the Preston Working Men's Club and the Avenham Institution. Such a result needs no comment. It speaks volumes in favour of the earnest and persevering manner in which the exhibition committee accomplished the fulfilment of their self-imposed task—a labour in which they met with the cordial assistance of all classes, from the Duke of Devonshire to the humblest artisan. The full measure of their success—the greatest yet recorded in the history of Working Class Industrial Exhibitions—will be better comprehended when we consider that at Wakefield, which had previously headed the list, the number of visitors was only 186,000; while at Birmingham, with its teeming population and surrounding network of densely-peopled hives of industry, the visitors scarcely numbered 120,000. Hence it becomes of some importance to discover the secret of the extraordinary success of the Preston Exhibition. The mystery is not one incapable of solution. From the very first the promoters had a purpose in view—an aim to attain—and they never relaxed in their endeavours, never flinched from the difficulties with which they had to contend, never allowed their hearts to falter or their hopes to become dimmed, until the goal was all but reached, and success rendered certain. The lesson of energy, determination, and perseverance thus afforded by the Preston working men, cannot fail to exercise a beneficial effect upon their toiling brethren in other parts of the country, and to foster that spirit of mutual emulation, to the continued development of which we must look in no slight degree for the real social and moral elevation of the industrial classes of the land.

Art and Handicraft.

II.—THE PRIMARY WANTS OF THE ARTISAN AS *A WORKMAN.*

THE great purpose of the workman in devoting any portion of his time to the study of art, is, or ought to be, the improvement of his handicraft, especially if this handicraft is of such a nature as to require a knowledge of art as an element, which is certainly the case in an immense number—probably, the majority—of employments.

In saying this, it is by no means intended to decry, or in any way undervalue the study of art by any workman, whatever may be his pursuits. That there is a manifest and decidedly healthy tendency in this direction amongst large bodies of working men, whose daily labour lays far away from the region of art, is a gratifying fact, proved most indisputably by all the Working Men's Exhibitions which have been hitherto got up, either in the metropolis, or the provinces. But whilst admiring the ingenuity, industry, and perseverance frequently displayed in these efforts, it could not fail to strike any observant person that the element of directness of purpose to some distinct and useful end was for the most part wanting; and that this was generally the case just in proportion as the artisan had deviated from the track of his own industrial calling, if that calling had any relation whatever to art. Possibly, the fact of being left in perfect freedom to carry out his own ideas, untrammelled by the peculiar notions of a foreman, or the foregone conclusions of an employer, often led to this result. Now, in all such cases it should be remembered that liberty without law is licentiousness, and that any artistic or scientific pursuit followed without such specific rules of action as may be necessary to carry the worker forward with some steadiness and fixity of principle to the end he has in view, mostly begets incessant difficulties in progress, and ends in failure, more or less marked, as a result. Unhappily, this failure, so evident to the looker-on, is not always so distinctly seen as it is desirable it should be by the earnest and enthusiastic, but mistaken worker; hence the bitter disappointments which have so frequently resulted after the adjudication of the prizes given in Working Men's Exhibitions. The fact is, the worker had aimed at reaching one standard—if, indeed, he really set up a distinct standard at all—and the judges, bringing a wide experience, and the test of principles, not perhaps always true, but still such as they felt fully justified in acting upon, were adjudicating according to a totally different measure of excellence.

Now, the painful and sometimes ludicrous results which have followed the efforts of working men—yes, and women too—in the direction of art, might have been avoided by at least something approaching to a preliminary training for the work they were about to undertake. Would they expect, in any ordinary pursuit in which they were engaged, their knowledge of the requirements of which enables them to see and appreciate all the difficulties of working at successfully, that a stranger totally ignorant of what he or she was about to undertake, would be likely to be successful, even in a remote degree? Would any one of them expect to write an intelligible letter without knowing how to read, or even successfully write the letters of the alphabet and put together single words in an intelligible handwriting? Yet it is not too much to say, that many art efforts are frequently begun with an utter absence of this amount of elementary knowledge of the thing to be done. This should not be, because it need not be. The workman really desirous to improve himself and employ even his leisure hours in something which interests him on account of its relation to some ideal of beauty or taste, however humble this may be, can, if he seeks it, easily obtain elementary instruction which, so surely as he once commences in all honesty and earnestness of purpose, will as surely reward him for his pains.

All intelligent and thoughtful persons must have realised the delight with which for the first time they have seen the principle of some familiar subject, whether they may themselves have suddenly discovered it, or had it explained to them by some friend or teacher. Thus, the pleasure and interest is always very great with which the art-student sees for the first time that all the complicated forms of a rich piece of ornamental work can be brought down to the simplest elementary lines, and that the great law of repetition has much more to do with the beauty and interest of the work than any special difficulty in its construction or execution. Even when the novice in elementary drawing is shown, as he ought always to be shown, the true use of his eyes in seeing, and the mechanical construction of his hand as a drawing instrument, or the simple geometric fact is pointed out to him that all forms must be represented by two classes of lines—the right line and the curve—whilst the invariable character of the former is at all times a positive test of the variable character of the latter, he gets an insight into the subject of the art of drawing which opens an entirely new field of operation to him; and the mere "rule of thumb" methods which he might have been pursuing prior to such insight, become positively distasteful to him, and he sees how much time he has been wasting in working without fixity of principle and aim, thus losing that force which, as already stated, is inherent in directness.

The artisan ought thus to see that, as *a workman*, he is directly interested in art in its highest, best, and most distinct form, or that he really has no true interest in it. He is, after all, the true executant, whatever amount of thought or direction he may be indebted to for the full utilisation of his skill. Though he may not be the designer, he will be all the better workman for understanding, not partially but thoroughly, what the designer intends. To do this, he must be, in some degree, at least, a designer himself; for if he is not this he will be little more than a machine. Intelligent work is happy work. To know why anything is to be done is to half know how to do it.

Let the workman, then, rest assured that sound elementary preparation for any art-work in which he may be engaged as his daily pursuit, or desires to engage in as the employment of his leisure hours, will be well spent at all times, but better spent at the beginning of his career than at any other period, since then it will form the foundation for the future. Now, although, in common with every other kind of education, art education is best begun while the student is young, let no working man really in earnest believe that it is too late for him to begin, if he has made up his mind to it, and decides to begin in the right way. Experience has shown that old heads wise enough to become young students can do very notable things in art under judicious direction. The difficulty, in nine cases out of ten, is to get them to begin. The disinclination of grown men to sit down in the same class with boys is, no doubt, very great, and the objection is often well based; but a judicious teacher would take care to provide against that, and arrange to always accommodate an adult elementary class when it was distinctly seen to be necessary. "Where there is a *will* there is a *way!*"

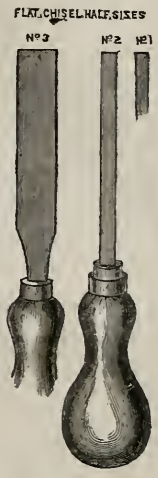
GEORGE WALLIS.

Carving in Wood.

(Concluded from our last.)

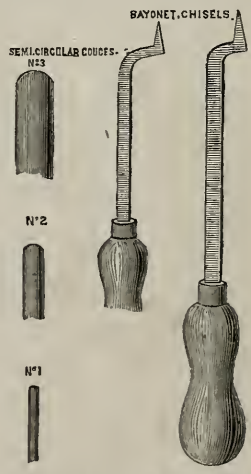
As regards patterns, we should recommend simple arabesque designs, in low relief, for a beginner; and, when further advanced in the art, foliage, flowers, and fruit, all of which should be studied from Nature, the taste and skill of the carver being displayed in the selection and general arrangement of the various objects, as well as in their execution. Subjects in high relief should not be attempted until some proficiency has been attained in the art. Those who intend to make wood-carving a regular profession should take lessons of a professional carver; but for the benefit of those who have no opportunity of obtaining the instructions of a master, we subjoin the few following rules, which will be found useful:—

In the first place, procure a small piece of *sycamore*, as being the softest wood of a close grain, and, therefore, the most easily worked by a beginner: have it cut and prepared by a cabinet-maker. If designed, say, for a book-stand, it should be polished on all parts excepting that designed for carving; the hinges should be screwed in on one side, but the stand should not be put together till the carving be executed. If a box be the subject for carving, all the six parts should be completely prepared for being put together—that is to say, the mitering or dove-tailing should be done, the lock put in, the hinges likewise; and then, of course, great care should be taken of the sharp edges to form the corners. There should be a space left unwrought between the carving and the edge, which the cabinet-maker would do well to mark out, by sinking a line all round



with a broad chisel. This will much assist the carver. The polished portions of the wood might be protected with paper or leather during the process of carving.

In commencing operations, the first instrument to be used is No. 2 straight chisel; the pattern having previously been sketched on the wood, or cut out in card laid upon it, and traced by drawing a pencil all round its outline, the card moved onwards as required. To persons not much accustomed to drawing, this will be found an easy plan. The chisel should be taken in both hands, and the



outline of the pattern, as well as the boundary line of the work, sunk by firm, yet gentle pressure. As the carver proceeds, he should excavate little by little with No. 2 semi-circular gouge, sinking straight down and excavating in turns, till the right depth of the foundation be reached, and the whole pattern completely blocked out square. He should then take one of the bayonet chisels, and commence levelling the foundation, which is the most difficult part of the whole work. But before we proceed further with these directions, the carver should be warned to observe whether there be any curled tendrils, requiring, in the first instance, the sinking of a round hole in the curl; because, if so, this must be done by means of a semi-circular gouge *before* the outer edge of the curl be cut out. Otherwise (were it attempted afterwards), the sinking of the hole would be likely to burst the wood in the parts

against the grain. Observe, again, that in the first blocking out, when two incisions have to be made—one with, and one against, the grain (the two incisions meeting each other)—care should be taken to cut across the grain first, and then with it, otherwise the wood will probably be split too far. Lastly, when blocking out a delicate object, such as a tendril, small twig, or berry, the incisions should always be made *beyond* it; cutting from, but never towards it. Thus, when one side is cut out, the wood should be *turned* for cutting the other side of the twig, the sculptor always keeping it *between* himself and the edge of the chisel, because he involuntarily presses the instrument outwards away from himself; so that, were his work beyond the edge of the chisel, it would be broken through, especially if against the grain. It may be here observed, that where delicate objects can be so arranged as to run with the grain, they are thereby the stronger; and, in designing a pattern, this should be invariably borne in mind; as also, that the knots should be used, if possible, for berries, or grapes, &c., and the hardest parts of the wood employed in the design, rather than left to be levelled, and to form the foundation.

But to return to the gradual process of carving. When the holes are sunk, the entire pattern blocked out, and the foundation tolerably levelled, the carver should commence shaping the leaves by using No. 3 flat chisel; sloping it as intended to lie—some parts in high relief, and some lying flat on the foundation. He should then mark out the veining of the leaf firmly with the same instrument, and with a semi-circular gouge proceed to hollow out the necessary indentations between the veinings. After this, he may slope away the thick parts underneath, to disengage it (apparently) from the foundation, then polish it with some fine glass-paper, rubbing with the grain, and, lastly, point all the edges with a very fine penknife. Should he wish to disengage a branch from the foundation, it may be done by carefully sloping a sharp chisel inwards on both sides under it (contrary to the general rule in carving, of not cutting towards an object), and when sufficiently thinned, he should use the penknife for cutting through and clearing the opening. This will require the utmost care. It must ever be remembered that carving requires a delicate hand: where one incision *might* effect the purpose, use *two*, and it will be better done. It is impossible to be too gentle; and the only circumstances under which force must be used is when first sinking, or blocking out the pattern.

All the work—sketching, sinking, and the purposes of the gouge—may be done by lamp or candle-light; but the levelling is an absolute exception to the rule, as it requires the clearest daylight; the eye being more deceived at night than would be imagined by the uninitiated until the fact is proved by examination in the morning of the work done at night. Care should also be taken that the subject or design should bear much the same proportion throughout—the various parts balancing each other; and the same precautions should be taken in regard to the spaces showing the foundation.

Although sycamore be recommended for beginners, *Irish walnut* is more satisfactory for those further advanced. They should, however, be on their guard lest American walnut be given instead: this being stringy, soft, and with little, if any, pattern in the grain. The light-coloured parts of walnut are those nearest the bark, and are softer than the dark. Beware of any appearance of yellow in the wood, which shows it to be rotten. Timber merchants generally oblige non-professional carvers to buy too much wood, and a good deal that is practically useless. Hence it is better and cheaper to procure a fancy piece from a cabinet-maker, who will readily prepare it for the work of the carver.

In making a box, the screws should be remembered in drawing the pattern, and the space they require left sufficiently thick. Beware of so planning the design as to have to sink for the foundation over it.

The best subjects for flower-carving are lilies of the valley, oak-leaves and acorns, convolvulus leaves and flowers, ivy wreaths, and grapes, with their leaves and tendrils. It will be found necessary to sharpen the tools continually during each day's work. Flowers, such as the rose, fuchsia, and others, which require attention to extremely minute details, should not be attempted by the beginner. The simpler the objects copied at first, the less the risk of failure. Many of the foregoing hints may appear superfluous; but good work may be often spoilt, and the sculptor disheartened, by reflecting too late; besides, "experience is a hard master." Should a berry, or any small object, be accidentally broken off, if not easily glued on again (which *must* be effected when part of a *branch* is broken out), it might be well to dispense with it; and to remove, if necessary, some other object of similar size, which formed a *balance* for it, so as to keep the proportions, if possible, correctly throughout the design. Figure-carving should never be attempted until the carver is perfect in the reproduction of foliage and ornament, and even then some knowledge of figure-drawing and anatomy will be found necessary, if the carver be desirous of avoiding anything approaching to failure. Grinling Gibbons' masterpieces were composed principally of fruits and flowers.

In conclusion, it may be well to add that the price of each tool, without a handle, is about a shilling (the handles are about twopence each), and that it would be well to procure a little leather razor or dressing-case, which may be rolled up, for holding the tools, as they would rattle about in a box, and become injured. It may also be well to observe that the three gouges should be respectively of the same size in the breadth of the blade as the three flat ones.

How We Saw the Old Year out and the New Year in.

NOT this year, but last—for this year began on a Monday; so, of course, "seeing the old year out," as some people like to do, was out of the question—we determined to make a night of it; but not a morning too. That style of thing does not suit our plain ways. Early to bed and early to rise makes you look fresh and bright in the eyes. Your heart will be light and your countenance clear; so we'll go to bed early, Nelly, my dear. I declare I almost get poetical, or at least run off into a kind of song when I look at my wife's fresh face early in the morning, and think that, though we have been married ever so many years, and brought up sons and daughters, there's a good deal of youth left yet to both of us. We have lost a little of liveliness, perhaps, but we have not lost the power of enjoying life and its good things, and seeing a great deal that is good and beautiful in the world; and that, I take it, is a sign of a youth which is not exactly to be reckoned by the number of years we have been in the world.

Perhaps the thought that we are really a year older than we were on the last day of 1863, makes me a little sentimental, which generally is not much in my line, for I like a joke, love to see a smile, and make a good deal of fun with my mates when it does not hinder work, and sometimes we work all the better for a good laugh. But, sentimental or not, my wife and I always like to see the old year out and the new year in; and when twelve o'clock has chimed, and the bells strike up, we feel somehow very happy, say good night to the big children who sit up with us, have a look at the little ones who are fast asleep in their beds—you should see little Lizzie cuddling her doll, just as her mother used to hug her when she was a tiny baby—and then go to bed, hoping to wake up in the morning with a determination to make the best of the New Year.

This is how we saw the old year out. When I came home from work I found Nelly had settled to have tea in the parlour instead of the kitchen, where we generally have our meals. She expected me to appear surprised, so, of course, I pretended to be; though, bless you, I knew all along what she was going to do, for she did just the same last year, and the year before that, and, in fact, every year since we have been married. And she had put on her best dress, and a new cap, with just a little bit of cherry-coloured ribbon twisted in and out; not too much of it—for Nelly has a good taste in colours, and knows when to stop—but just enough to set off her brown hair, which is as thick and bright as ever it was, and not a speck of grey in it yet.

"Good evening, Mr. Tom," she said. "Will you do me the favour of giving me your company to tea?"

What I did give her was a good kiss. "Me one, too, daddy," called out little Lizzie; "kiss me." "And where's mine?" says Polly, who is three years older. "And mine?" "And mine?" call out three or four others; and so we kiss all around, and then I said—

"Why, Nellie, what a wonderful cap you have on! I can make a good many curious things in the shop, I can, but I couldn't make that cap if I tried all day. But I say, Nellie, if I am going to a tea-party, I must put on my visiting clothes, you know, or perhaps the lady of the house will say I don't treat her with proper respect."

"Go along with you, and make haste, then. The tea is made, and so is the toast; and there's a rasher of bacon, in case anybody should like it," she said, just as if she did not know what a treat a nice rasher off the streaky part is with tea.

"Shouldn't wonder if I had got some shrimps," I said, "just for Lizzie, and Polly, and Billy, and that young Turk Alf, to look at, and study natural history—not to eat, of course."

While they were all laughing, I ran away to have a good wash, and put on my Sunday suit, and a new black necktie, which I saw on the drawers, wrapped up in paper, with "For father" written on the outside. Then I came down, and if we didn't all enjoy our tea it was a pity. I think my wife is out and out the best judge of a piece of bacon you could find anywhere, and as for the shrimps, they disappeared in no time. There was actually a cake, too; and I was obliged to eat a bit of Lizzie's slice, for, as she was sitting on my knee, and would push it into my mouth, what else could I do? How she did laugh when I made a shrimp drink by hanging him over the edge of a teacup, so that the tea rose up through him, and ran down into the saucer. I don't like to bother the young ones with science when they are enjoying themselves; but if I had told them that that shrimp was really a syphon, I dare say they would have understood the principle at once.

When tea was over, Polly helped to clear away the things, and mother—I always call her mother when the children are about; she likes it, and says that, as a title, duchess, no, or even queen, is not to be compared to it—swept up the hearth, and we pushed the table back, and sat in a circle. Somehow, Billy crept close to his mother, and Lizzie was upon my knee in a minute, and Polly sitting by me with her fat white arm looped in mine.

Of course there were a good many little things to chat about. What I had been doing all day, and what they had been doing at home. I told mother what a big engine we were making on a new construction, and she told me how she thought she had lost little Billy.

"I could not see him anywhere, father," she said, "and had sent Polly to look for him, when Mrs. Wilkins called over the wall, 'Here's one of your boys here.' 'Is he upside down?' I asked. 'Yes,' she said, 'trying to stand on his head against the wash-house.' 'Then it's Billy, I know,' said I; 'for upside down he always is, and ought to wear his boots on his hands.' How's Charley Haynes getting on, father?"

Charley works in the same shop as I do, and ought to do well if he liked; but he is one of those men who never make the best of anything. He rather looked after Nellie when she was a girl, and once I was nearly jealous of him; but she said she did not like a man who would not stick to his work, and at last he married a girl, with a pretty face and a liking for artificial flowers, but for very little else; and a queer home they have, that's a fact.

"Well, mother," I said, "Charley and his wife are going to see the old year out at the theatre. She has bought a dress at a ladies' wardrobe shop—you wouldn't look at it, mother—and he has picked up a second-hand coat, which don't fit him, and a hat which is as shiny as the coat. That's their notion of enjoyment, but not ours, mother, is it? Sykes, and Wilson, and Robinson, and two or three more, are seeing the old year out over a tripe supper and cards. There will be too much drink about, mother; and if they don't lose at least half a day to-morrow, I shall be surprised."

So we chatted on, and then Nelly ran away to prepare a little treat, in the shape of a supper of hot sausages. We are satisfied with a bit of bread and cheese generally, but this was a special occasion. The little ones had gone to bed, and Nelly number two (our eldest girl), and Tom junior (that's our biggest boy) sat up with us. Tom had to tell me about a book he had been

reading (we have a good shop-library for those who like to subscribe), and young Nelly was helping her mother with a little bit of stitching. Once or twice I looked at my watch, for twelve o'clock was drawing near.

"There they go! there they go!" called out Tom and Nelly, as the bells struck up. "A happy new year, father and mother—a happy new year."

We sat for a minute or two thinking over old times, and watching the faces of the young people; then we knelt down, and, while the bells were still clanging out merrily, we reverently asked that all the evil of the old year might be forgiven, and that the new year might make us wiser and better, stronger for duty, and more loving to all.

I have read that bells were once rang to drive away evil spirits. I hope they drove away bad thoughts from us, and welcomed in new-born influences and a better time.

That is how we saw the Old Year Out, and the New Year In.

Friendly Societies.

SUGGESTIONS FOR THEIR ESTABLISHMENT ON SOUND PRINCIPLES.

JOHN TIDD PRATT, Esq., the Registrar of Friendly Societies in England, has recently issued a series of instructions, the object of which is to promote the general welfare of the working classes, by enabling them to make provision, upon sound principles, against the natural evils and exigencies of sickness, old age, and death, and to act on those principles of mutual assurance and support which are now so generally adopted by the more opulent members of society, and to guard them against the many plausible but ruinous schemes by which they are too often deceived. In a society founded on the tables furnished by Mr. Pratt, it is as certain as it is possible to be, that the benefits subscribed for by the members will be received by them. The sickness tables cease at sixty, sixty-five, or seventy years of age, up to which period the data upon which they are founded are well tested. The annuities, or old age pay, commencing at sixty, sixty-five, or seventy, and the sums payable at death, will be guaranteed by the Government. No further certainty in these respects is attainable. Every member should be at liberty to subscribe to one or all of the objects, according to his ability or inclination, with the exception that persons insuring against sickness must also insure for medical attendance as long as they reside within the limits of the society; and females, as well as males, may subscribe for any of the benefits, except relief in sickness. Mr. Pratt furnishes examples from the tables, from which persons may select such benefits as they may think fit to subscribe for. All money received for sick-pay, endowments, and expenses of management, should be invested in a savings bank, on Government security, or on the securities authorised by the Friendly Society Act.

The management of the society should be vested in a committee, consisting of honorary and benefit members, or of benefit members only; and there should be trustees, a treasurer, visitors, secretary, and auditors. The only paid officers should be the secretary and auditors. The accounts should be kept so as to show the contributions paid to, and benefits paid out of, the fund subscribed for each particular insurance, as well as for expenses of management. The society should be self-supporting, for which purpose each member should be required to pay a small sum per month for the expenses of management; and the place of meeting should, if possible, be at some public institution or schoolroom. If that cannot be obtained, and there is no other place except an inn or a public-house, a certain fixed payment should be made for the use of the room, lights, and fire, with a stipulation that no beer, &c., should be brought into the room until all business is concluded, when each member should pay for any refreshment he may require. When an anniversary or annual feast is held, the contribution thereto, and attendance thereat, should be voluntary, though there seems no objection to a rule, that every member, who lives within a given distance, should have a ticket sent him, which, if not returned at a certain time—say a week before the day of the feast—he should be required to pay for. In a society formed on these principles, every member will have to pay only such contributions as may be required by the rules and tables for the benefits he wishes to receive, and there will be no compulsory charges for beer, feasts, useless paraphernalia, or other extras.

BENEFITS.—The benefits assured should be—1st. Medical attendance. 2nd. Weekly allowance in sickness until sixty, sixty-five, or seventy. A small monthly payment must be made to defray the necessary expenses of management. Immediate Annuities or Deferred Annuities, from £1 to £50 per annum, commencing at sixty, sixty-five, or seventy, and sums payable at death from £20 to £100, may be secured as hereafter mentioned. Care should be taken to admit as members insuring against sickness, such persons only as are of good health and good moral character, and certificates to that effect should be produced before a person is admitted a member. No entrance fees should be required, nor should any fines be incurred for non-attendance, or not serving office, except that of visitor. The tables recommended by Mr. Pratt for relief in sickness have been approved by experienced actuaries, and the premiums required are the lowest compatible with safety to the insured. Each member will pay according to his age at the time of admission, and will, therefore, bear his own burden, so that the young will not have to pay for the increased risk of the aged. The accounts should be kept in such a way as to enable the annual statement to be made out in the manner directed by the Registrar, pursuant to 18 and 19 Vict. cap. 63, and should be audited quarterly by persons not members of the society.

MEDICAL ATTENDANCE.—The contributions for medical attendance, as agreed with the medical practitioner (which is generally 4s. per annum, or 4d. a month), should be paid when the member is admitted, quarterly, in advance. This benefit is claimable from the time of admission.

SICKNESS BENEFIT.—Every industrious and provident person should, immediately he begins to seek a livelihood, insure against sickness. Savings banks afford no provision against sickness; for, suppose a man to have saved 1s. per week for one year, and then to be assailed by accident or ill-health, he will, at the rate of 10s. per week, consume his savings in little more than a month. On the other hand, a member entering a society between the ages of sixteen and twenty-three, may, by a payment of 1s. per month only, secure to himself an allowance in sickness of 10s. per week, according to the rules and tables. The society's allowances in sickness are assured, subject to its rules and tables. Allowances of 10s., 15s., or 20s. per week may be assured for, the rates of payment for which are equitably adjusted, according to the age of each member on admission; and the period to which the benefits are insured for—until sixty, sixty-five, or seventy years of age but should in no case exceed two-thirds of what he can earn in good health; and no member should be allowed to belong at the same time to another society for the same benefits. Male members can only be admitted to insure in this fund between the ages of sixteen and forty; members free six (or twelve) months after admission. Every member insuring for sick pay must also insure for medical attendance. The payments in case of sickness to be made in full for twenty-six successive weeks; half the amount for the next twenty-six weeks; and if the sickness shall continue, the member shall be reduced to quarter pay; and when any member has had full pay for a less period than twenty-six weeks, or half pay for a less period than twenty-six weeks, he shall not be allowed to begin his full or half pay over again on the renewal of sickness, until he shall have ceased to receive any pay whatever on account of sickness for six calendar months, and returned to his usual employment, or some other by which he shall gain a livelihood; but if he fall ill within that time, he shall be placed in the same situation as when he ceased to receive any relief, and shall receive such relief, and no other, as he would have received had no cessation of his sickness occurred.

EXPENSES OF MANAGEMENT OF THE SOCIETY.—A payment of 2d. per month in advance is required from each member.

ACCOUNTS.—A separate book, a clear and distinct debtor and creditor account, and a separate fund should be kept for each benefit. The books, receipts, investments, and accounts of every kind, ought to be thoroughly examined by some competent disinterested person, once a quarter. "Instructions in Book-keeping for Friendly Societies" may be had on application to the Registrar.

ANNUITIES AND SUMS PAYABLE AT DEATH.—The Postmaster General is empowered, under the Act 27 and 28 Vict., cap. 43, to insure the lives of persons of either sex between the ages of sixteen and sixty, for not less than £20, or more than £100. He is also empowered under the same Act, to grant Immediate or Deferred Annuities of not more than £50 on the lives of persons of either sex, and of the age of ten years and upwards. The persons whose lives are insured, or to whom annuities are granted by the Postmaster-General, have direct Government security for the payment of the money at the proper time.

Certain post-offices (the names of which may be obtained at any post-office), have been opened for the receipt of proposals for the insurance of lives and the purchase of annuities; and forms of proposal, with full instructions for filling up and delivering these forms, may be obtained at these post-offices.

Tables of the premiums to be charged for the insurance of lives, for the grant of immediate annuities, for the grant of deferred annuities, or deferred monthly allowances, without return of purchase money, and for the grant of deferred annuties or deferred monthly allowances, with return of purchase money, have been printed, and may be seen at the post-offices which have been opened for the receipt of proposals. These tables may also be obtained of Messrs. Eyre and Spottiswoode, London. The price of the tables for the insurance of lives, and the grant of annuities without return of purchase money, is 3½d. The price of the tables for the grant of annuities with return of purchase money is 2d. If sent by post, 5d. is charged in the one case, and 3d. in the other.

Persons desirous of providing for relief in sickness or old age, or of securing a sum of money payable at death, should, before they become members of any society on the application of agents, obtain a copy of the rules, and should not be satisfied with a card on which payments only are entered. They should also ascertain whether the rules have been duly certified, and particularly in what manner they, or persons claiming on their death, are to proceed in case of dispute; as in societies established in London, Bristol, Liverpool, or Manchester, &c. &c., disputes are by the rules of the greater part of these to be decided by arbitration in the place where the society is established—that is, a claimant living in Manchester having insured in a society established in London, would, in case of dispute, have to attend an arbitration in London; in addition to which, the parties insuring should ascertain the names of the trustees and officers of the society, their residence and business, as well as their respectability. By the 27 and 28 Vict., cap. 56, ss. 4, 5, no stamp is chargeable on any probate of a will, or letters of administration, with or without a will annexed, granted in England or Ireland, or inventory to be exhibited and recorded in any Commissary Court in Scotland, of the estate and effects of any person deceased, in any case where the whole estate and effects of the deceased person dying after the 25th July, 1864 (exclusive of what he shall have been possessed of or entitled to as a trustee for any other person or persons, and not beneficially), shall be sworn not to exceed, and shall not actually exceed in value the sum of £100. This provision will be found of great benefit to depositors in savings banks and members of friendly societies, particularly with reference to the easy and comparatively inexpensive mode of now obtaining, by personal application at 12, Great Knight Rider Street, Doctor's Commons, London, or at the office of the District Registrar in the country, a probate or letters of administration. It should be distinctly understood that the certificate of the Registrar is confined to the fact that the rules are in conformity with law, and does not apply to the sufficiency of the contributions to meet the payments. This is the province of an actuary. If the rates of contributions and payments have been prepared by an actuary, that fact is stated in the Registrar's certificate. The tables alluded to in the foregoing suggestions can be procured on application to the "Registrar of Friendly Societies in England," 20, Abingdon Street, Westminster, S.W.

Diversity of the Working Class.

When the existence of working men as a body is brought before the mind, it is surprising how the subject grows as it is contemplated. It tasks the imagination to take in its multifarious parts. The producing power of the nation increases every hour. The working class is becoming the formidable class—not formidable as was formerly feared, in the sense of being dangerous, but formidable in the sense of vastness and beneficence. It is the great creating class.

It is quite time that an adequate periodical should exist, to represent this ever-developing and stupendous interest. The working man is a very composite person. The French idea of him as a *prolétaire*—one who works for wages and has children—describes but one, and that not his greatest, characteristic. The British working man aspires to be something more—to be intelligent, saving, thinking, and improving; as well as industrious. Indeed, "working man" is becoming a name of honour. Political economists have brought idlers into discredit, even among the upper classes; and it is now no uncommon thing to hear noblemen, and persons of high social station, tell audiences, at mechanics' institutions, that they (the speakers) too are working men. Gentlemen now claim to be considered as working as hard as any mechanic, and it must be owned that great numbers of them do so work. Literary men, politicians, doctors, lawyers, clergymen, philosophers, are certainly among the hard workers. Even poets, considering how many of them labour at stubborn metres, may take rank among the working classes. Lord Palmerston, gay and jaunty as the noble Premier was, was well known to be a hard worker. True, he worked at making despatches, but that is quite as hard work as making despatch boxes; and often harder, when you have to defend the despatches after having written them. Lord Brougham has been one of the hardest working men of his age. The Chancellor of the Exchequer probably works as hard as any tax-payer for whose contributions to the State Mr. Gladstone is responsible. It is clear, then, that the term "working man" is rapidly acquiring a higher and more national significance than it ever bore before. It is no doubt destined to grow into yet greater reputableness and universality of meaning.

How has it come about that the labour of the working class has become so much more fruitful in later years than formerly? The answer is—by the infusion of thought into its ranks, and by the employment of thought in directing the activity of Labour. The hand-worker never went far, until the brain-worker stepped in to counsel him. Hand labour may be compared to the bone and muscle of Industry—but brain labour is the life blood that gives it vitality, and makes it grow. There is a further element, that of Capital. It is capital that sets the brain worker going. The judicious employment of capital is the birth of enterprise, so that the discussion, illustration, and delineation of the topics characteristic of the working man, as an individual, take a wide range; and our readers will be found in every section of the community, as well as the class peculiarly indicated by the term "working man."

The old form and even spirit of patronage of the working class is happily dying out—but there is a new form of patronage—that of intelligent discrimination of the quality of their work—which we hope will come in. It is the purchasing public who are the true patrons and best patrons of the working class, providing their patronage is given to excellence of workmanship rather than to mere cheapness. But this can only come about by the public becoming cognisant of what the working man's best aims are, which can alone enable them to extend an intelligent, honourable, and independent encouragement to work which displays thought, care, integrity, and, possibly, genius.

An Address.

TO THE WORKING MEN OF THE UNITED KINGDOM.

Brother Working Men,—A few words may not be inappropriate to you all—to friends, old and new—at the close of one, and the commencement of another period of mutual relationships. We have "rung out the old year"—we have "rung in the new;" and we trust that all of us have entered on a happy new year of earnest progress and rational joy. The way in which we hope in this, our special department, to help you, our fellow-workers in the great field of Life, to make that progress and win that joy, will be best explained by considering—

I. *Some of the Evils under which Working Men at present labour.*

What are they? "Insufficient wages," exclaims one. "Want of comfortable homes," replies another. "Long hours of labour," maintains a third. Very true, gentlemen. These, and many other evils, might be mentioned, under which different sections of your class suffer. *But* let us ask you a question. Did you ever see a human skull, and notice how the hard bone is hollowed and indented? Well, doubtless, you know it has been found that the soft, nervous matter inside—the brain—to a great extent, moulds and shapes that hard, bony shell, making it take such form as shall correspond to its own inward growth. In that fact, and in many similar ones to be found in animal and vegetable life, you have a type of a grand truth closely affecting our happiness and well-being generally—viz., that our outward circumstances are very much moulded by our characters and thoughts. It is also true that our characters are much affected by our outward circumstances; but people are too apt to notice only that part of the business, and to forget, or be ignorant of, the other far more important fact. The evil result of this is, that they too often spend all their force on trying to alter their circumstances, and take little pains about that inward force and power which really has most to do with shaping their outward condition. The rate of wages men earn, the sort of home they live in, the length of time they have to work, with many other material circumstances, depend to an extent which only a few among them at present perceive, on the education they have got, the strength of will and honesty of purpose they possess, their faithfulness to duty, the way in which they have used their *opportunities* in life, and on many similar points, all connected with the inward life, growth, and power of their intellect, conscience, affections, and will.

Now, whether you agree to all this or not, you will, at all events, allow that a man's education, &c., exerts *some* influence in shaping his after life—must help or hinder, in some degree, the removal of evils that oppress him, and the obtaining benefits which he ought to enjoy. *We* cannot—this Journal cannot—give you shorter hours, larger wages, better homes. Would that we could! But we may be able to help you in procuring these and other blessings which we long to see all men enjoying, if you care to accept what we can offer. Let us examine what that is, and how it may help you.

One great cause of the evils working men suffer from—so far as those evils depend on defective education—is the *narrow*, incomplete view many of them take of various questions, compared with persons of equal intelligence in higher social position. The mistakes working men make, and the misfortunes they suffer from this one cause, are very considerable, as I have had too much reason to observe during the quarter of a century I have lived and worked among them. Now, if you go into a large workshop in the dark, or with only a farthing rushlight, not knowing where the benches, lathes, or wheels are placed, you run a chance of knocking your shins or bumping your forehead against something much harder and sharper. You can't see the position and mutual relation of the different things in the shop. You must feel your way about slowly and cautiously, perhaps not finding what you want, after all; but if the gas were turned on, and a blaze of light filled the place, you would see at once where you are, and where everything else is—how to get at this bench or those tools, without cuts and bruises. Education is the light which enables men to understand *the true position* and relation of things and persons around them—to see where they themselves are, and how to get to the point they want to reach.

Then, again, in the dark we are apt to *exaggerate* the size and importance of objects and events. Working men frequently make serious mistakes owing to this cause, from which fuller information, or greater breadth of view, would have saved them.

Another frequent cause of working men's troubles are the *jealousies, suspicions,* and *quarrellings* that too often arise among themselves. There is no end to the mischief resulting from all this, whether in the workshop, the Co-operative Society, the Working Men's Club, or the Trade and Benefit Society, &c. I need not enlarge on this point. It is sufficiently well understood by most working men. But what they do not so thoroughly realise, perhaps, is the extent to which this evil also, like the last, is caused or fostered not merely by that want of higher principle which is needed by us all, but also by their not seeing things and persons in greater light, not understanding more clearly their mutual relations and position in the world—by *mis*understandings, in fact—also by that same habit of exaggeration above referred to. Another source, however, of discord and bitter feeling undoubtedly often is the heavy pressure on body and soul of a working man's cares and toil, with (unhappily) little, perhaps, at home or in his education to cheer or divert his mind, and a great deal in his companions or his amusements to add to his irritability and ill-feeling.

This last suggestion reminds me of one more, and a gigantic cause of the working man's troubles—viz., the extent to which he is dependent on the *public-house* for his recreation and social intercourse as well as for business purposes, after the day's work is done. Working men cannot in general invite friends to their own homes, nor have all those pleasant little parties, or chat with friends there, which so often refresh their employers. Keeping no servants, wife and daughters hard workers like himself, having but one living-room, and probably several children, without books, drawings, games, or music, or plenty of space and fresh air, an over-tired man, with little education, unfortunately cannot always get the change and refreshment at home which he unquestionably needs quite as much as richer men, and we cannot wonder that he seeks it at the public-house. There, too often, he forgets that he is a man, with all a man's rights and duties, with all the privileges and blessings in which, as an Englishman, he ought to share; and as, in that case, he was too probably little more than a machine while at work, too often he becomes little better (sometimes worse) than an animal when that work is done.

We come now to the consideration of—

II. *Some of the Remedies for those Evils.*

These, I think, will be found, according to what has been said above, and as far as we have the power to offer them, to consist—

First, in a man's obtaining as much information as reading and conversing, listening and looking

can supply—gaining as much knowledge as others and ourselves can provide on all subjects connected with your work and its remuneration, your domestic comfort and recreation, your position in society and well-being generally. That information, with the views and plans that may be suggested by it, will be given, as far as space allows, in the various departments of the WORKING MAN, whereby we hope, at all events, a few jets of light will be "turned on," that may help some to avoid breaking their shins, and worse misfortunes, as well as assist you to obtain various benefits for those dear to you and for yourselves.

But, secondly and especially, I would ask you to accept information that may not seem at first to bear directly upon your pecuniary, domestic, or social well-being, but which the wisest among you rightly believe you will find of the greatest value. I mean information respecting what great folks and little folks have been doing in various departments of life, in former times and the present age, both in this country and elsewhere—what the statesmen and warriors, the heroes, prophets, poets, and philosophers of the world have been attempting and accomplishing—what they suffered and how they worked, how communities and states have risen and declined, how the great masses of the people have fared amid all the chances and changes of empires and trades. If you, the hand-workers of England, can find time to read what we shall labour to put before you on these matters, you can see how it may possibly help you, by referring to what I said above respecting the evils many of you suffer from. See how much of that *narrowness* and incompleteness of the views you sometimes take, would be remedied by knowing more fully what has been done and suffered by other people—seeing how they worked, prayed, bled, triumphed. Such knowledge, at the time you acquire it, may seem to have no practical bearing; but gradually you will find it exerting a powerful influence on your condition. It seems a very unimportant matter which way that man yonder is turning those iron rods; but wait awhile. When the moment comes for determining whether your railway train is to go to Birmingham or to Plymouth, or to neither, but to be smashed to shivers, you find it makes a great deal of difference whether "the points" have been turned the right way previously. Varied and accurate information, knowledge about a great many things not apparently connected with the wages you are getting, or the homes you live in, or the occupation of your children, or the price of bread and meat, will often exert a wonderful influence on your happiness, just because that knowledge has "turned the points" the right way in your mind before the time for action came—has given you that breadth of view and that perception of the actual relations of things which enables you to form a wise judgment—a correct opinion as to where you are, and whither you ought to go. Much time, also, as well as bruises, may be saved by getting plenty of *light* in this world. The middle and upper classes in this country are at an immense advantage compared with many working men, because of the greater breadth of their views which they gain from their larger culture. Will you let us help you to supply this defect, if you labour under it, for your own sakes—for the sake of those you love—for the sake of *all* the other ranks and sections of this great community, who can never really prosper by the degradation or mistakes of their fellow-countrymen; who must be the better and happier for your progress, even as you must benefit by their prosperity?

See, again, how this increased knowledge helps to prevent that tendency to *exaggeration* to which I alluded above, as a frequent cause of working men's mistakes and troubles. We often attach undue importance both to things and persons, to measures, plans, events, simply from not knowing what has been done elsewhere, and on former occasions. Moreover, when we have only one or two ideas and facts in our heads, of course we think a great deal more of them. "As busy as a hen with one chick," says the proverb: ay, and as conceited, too, or, at all events, as liable to exaggerate its importance, is the man with one idea. But let him acquire a goodly number of ideas, and store up in his memory a fair collection of facts, and he can see a great many other things in their true proportions and position. Molehills will not look like mountains, nor geese be taken for swans. If a man is reading what they did in Holland three hundred years ago, or in Germany further back still, or in Italy when Garibaldi's great grandfather was in short clothes—a fellow-workman may think he is wasting his time; but I suspect he will be found all the more able to take a sound view of things in his Co-operative, Trade, or Friendly Society, for what he has learnt in history, though he or others may not exactly see why. A working man who has some knowledge of history and literature, will look at the question of an extension of the franchise, of a benefit club, of a strike, or of some limited liability company, with a much greater chance of avoiding blunders, than a man who has nothing to think about but one or two questions, and half a dozen arguments all of the same stamp.

HENRY SOLLY.

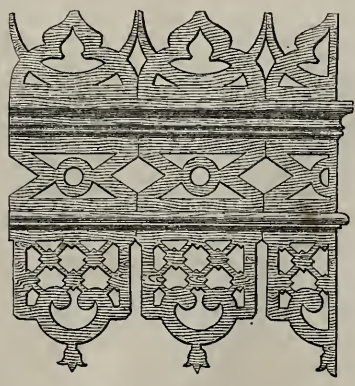
(To be continued.)

Art Designs

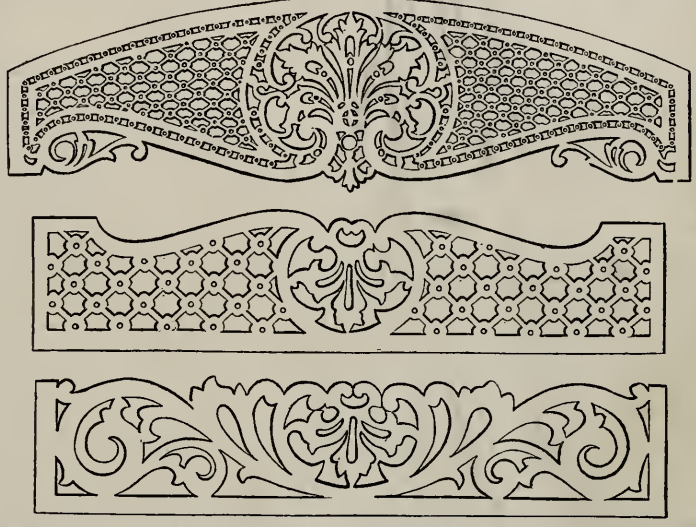
FOR USE IN TRADES AND MANUFACTURES.

ORNAMENTAL FRETWORK.

IN selecting our designs, we have preferred those of a simple and uncomplicated character, as being more generally useful and effective. It is a common error to believe that the more intricate and loaded the details of an ornamental design, the richer and more effective it becomes. So far from such being the case, the excessive use of elaborated details is frequently resorted to merely to conceal a want of design. Simplicity and grace should never, where possible, be sacri-



ficed to redundancy and heaviness. The designs given by us this week are capable of being utilised in many ways. They might suggest new shapes for ornamental ridge-work in clay, stone, or metal. They might also be found serviceable in the construction of articles of furniture, in which ornamentation has to be introduced, such as bookcases, cabinets, what-nots, &c. In verandah work, especially, they would be found useful. In nothing are we so backward as in this description of work, although it affords almost every opportunity for the employment of the ingenuity and taste of the worker. With some few exceptions, we have scarcely got beyond the upright sticks and crossed laths of our fathers, although the employment of perforated ornamental work has long been known in this country. In our industrial exhibitions few examples of ornamental fretwork have been displayed, a circumstance which would naturally lead a stranger to conclude that it was a branch of art-industry wholly unpractised here, although, in sober truth, there are many British artisans whose handiwork will bear the closest possible inspection with that of the continental fretwork manufacturers.



Some Fallacies in regard to Working Men.

BY THE REV. DR. BEGG.

ALTHOUGH a vast increase has taken place of late years in the wealth and influence possessed by working men, their social comfort has not always increased in the same proportion. In some districts they have made most successful efforts in the way of self elevation, but they are very far as yet, as a general rule, from understanding their own power for good; whilst their praiseworthy efforts have in some quarters been regarded with unjust and ungenerous suspicion. On the other hand, we see in Britain the tendency which all prosperous nations have exhibited, and which has been the main cause of their downfall, to form an increasing gulf between the two great classes of society—the rich becoming richer and the poor more depressed. In many of our richest cities a large class of persons are found, sometimes called the "dangerous classes," whose social position is in some respects lower than that of savages. We have the strongest conviction of the power of self elevation on the part of our working men to an extent unspeakably greater than has yet been realised—nay, we are convinced that they never will be elevated in any other way than by their own efforts; but as the result of considerable experience, we are also convinced that a number of floating fallacies exist, constituting to a large extent an unsound public opinion, and tending greatly to retard this good work. These fallacies exist partly amongst aristocratic and well-to-do people, and partly amongst the working classes themselves. To some of these we respectfully solicit the attention of our readers.

Many seem listlessly to imagine, for example, that the state of depression in which many of the labouring classes in our cities are found is necessary and incurable. They regard it as a necessary consequence of gathering men together in large numbers in cities, and therefore they look with a cold and heartless incredulity upon

all efforts in the direction of amelioration. They are even heard to quote Scripture on the subject, and to say, "The poor shall never cease out of the land." Admitting this, however, it is our duty to diminish the numbers of the poor as much as possible. But the fallacy lies here—that the working men are *not the poor*. No class of men in the community are, in a sense, more independent than the sons of toil, if they are only industrious and frugal, and if they will combine for their own self elevation. It is a pure delusion, moreover, to imagine that men combined in cities must necessarily lay their account with being surrounded with a mass of social degradation. On the contrary, the combination of wealth and intellect in large and prosperous cities, if only properly applied, ought to lead to the very opposite result. All physical appliances for the promotion of human comfort ought to be more abundant in a large city than anywhere else—especially than amongst the scattered houses and hamlets of a rural district. We see illustrations of the application of this principle in the magnificent draining operations of London, and in the bringing of the pure waters of Loch Katrine thirty miles, at great expense, to supply the wants of the people of Glasgow, so that every working man there can drink in his own home a fluid as bright and sparkling as ever supplies the palaces of kings. The same principle, however, is of indefinitely extensive application, and the opposite view is a pure fallacy.

But even when this is admitted, the idea is only, in some minds, more deeply rooted, that all improvements must be made by Parliament and public taxation, and that the working men are only a class of larger children, whose elevation must proceed, not from themselves, but from what is called a "paternal government." Now, of course, there are certain things in accomplishing which the interposition of Government, or at least of Parliament, is necessary, but this is true not only in reference to working men, but to all classes of the community. This is one of the great uses of Government; but beyond this, the lesson of self-reliance is one of the most important which can be taught to all ranks of the people alike. It is perfectly certain that the working men of the kingdom have enormous material resources, if they only knew how to take full advantage of them. Nearly the whole floating capital of the country passes periodically through their hands, and the great want is simply the power of retention or saving developed in a sufficient degree. Take, for example, in addition to the ordinary expenditure of the country, which all runs in this channel, the recent enterprise upon which probably the largest amount of capital has been expended—*viz.*, the Railway System of Great Britain. The expenditure here has been at least £400,000,000 of money. To whom has all this money been given? No doubt a considerable portion of it has been given to lawyers, engineers, and landlords, but the great mass of it has gone directly into the hands of the working classes—navvies, miners, workers in iron, furnace-men, masons, carpenters, and other classes of working men. Besides, consider the amount annually expended in upholding and working these railways, and the immense impulse thereby given to house building, commerce, and land improvement, all leading to a similar expenditure, the amount of which it would be difficult to calculate. All this goes to increase employment and augment wages, and is only one illustration of what we have stated—*viz.*, that the floating wealth of the country passes to a large extent periodically through the hands of working men, and that, therefore, they have great and growing means of self elevation. The abuse of this power in procuring noxious indulgences has often been justly calculated and commented upon as a proof of the resources of working men. It is more pleasing to contemplate the frugality and wisdom by which, to a large extent, this money is being employed, as a proof of the same truth. The vast accumulations in savings banks and in benefit societies of recent years, are worthy of notice. In Scotland alone it appears by a recent return that there is deposited in the savings banks nearly £3,000,000, belonging to nearly 150,000 depositors, and that one-half of this is in Lanarkshire, the very part of Scotland which has enjoyed the greatest material prosperity. By a return lately published by Mr. James Taylor, the honorary secretary, in regard to "the position of the Freehold Land and Building Societies held at 44, Waterloo Street, Birmingham, to June 1st, 1865," it appears that the following splendid results have been realised by the working men there, connected with one enterprise:—

Advanced on mortgage	£561,500
Now due on ditto	259,000
Absolutely redeemed	£302,500

The Flour Mill at Leeds, and the Co-operative Company at Rochdale, are well known to have realised similar great results. These, besides, are only samples—no doubt very successful ones—of what working men can accomplish, and are accomplishing, by their increasing wealth in all parts of the United Kingdom.

No doubt there are two elements essential to this success in any large degree—*viz.*, strict economy and hearty co-operation. The mottoes and maxims of working men must be, if they would really rise in the world, "Union is strength;" "A penny *hained* (saved) is a penny gained." All time is made up of seconds, the whole ocean of drops, the whole globe of particles. "Take care of the pence, and the pounds will take care of themselves." If these maxims were only acted upon by the whole working men of Britain it is difficult to say what they might not be able to achieve.

Here, however, a new fallacy comes in. Many well-meaning people startle at the word *Co-operation*. The idea of evil combinations and conspiracies, followed by revolutions, at once occurs to their minds. They forget that all good things are capable of abuse, but that the possible abuse of a good thing ought never to be regarded as any disparagement to its use. We see the noble power of co-operation in all great achievements—in the operations of the coral insect, of the bees and ants, to whom we are sent to learn lessons in Scripture. We see it in that wonderful railway system to which we have already referred—in the tunnelling of the Alps, and the girdling of the world by means of the electric telegraph—in all the operations of our joint-stock banks and limited liability companies. The higher classes never scruple to co-operate and combine their forces, and why should the working classes? Men have combined in vast organised masses to deluge the world with blood, and why should they not combine to diffuse and secure the blessings of the arts of peace? Nay, co-operation is Divine. As one has said, "The cluster is from God as well as the grape;" "Bear ye one another's burdens, and so fulfil the law of Christ." The work of the missionary in going down the great pit of human depravity whilst others hold the rope above, is an illustration of the blessings of co-operation. So it must be in all work of self elevation on a large scale at home. Indeed, it can be accomplished in no other way, and the process should be regarded with great complacency. The march of civilisation, as well as of Christianity, is essentially bound up with the persevering and successful application of this great principle. The workmen of Britain are no longer the serfs which their ancestors were, and it will not do to treat them as a kind of wards of Chancery, for whom everything must be arranged, and all whose wise and laudable movements in the way of self elevation must be watched with suspicion and distrust. But, besides, it is a thorough delusion to imagine that men are safe because they are dependent, and dangerous because they are prosperous and well-to-do. The case is precisely the reverse. If our nobility and wealthy men wished to raise a strong barrier around them and their just rights, they could not do it more effectually than by the diffusion of wealth and substantial comfort amongst the general community. Cobbett said, "If I were a ruler I would rule by flitches of bacon in the roofs of the cottages, for there is no revolution so dangerous as that which proceeds from the stomach." "Empty stalls make biting horses," is an old proverb. Ireland, the poorest, is at the same time the most turbulent portion of the United Kingdom. The *improvident* are also the *uneasy* classes everywhere. A diffusion of general comfort was the rule of Palestine under the immediate government of God himself, and experience proves that a working man with a little property takes as deep an interest in that property and in the Government that guards it, as if it amounted to millions. The man in Fife who was a great democrat when he had nothing, but who became a good citizen when he could say, "I have now a *coo* (cow)," affords a striking illustration of the true working of human nature. The possessory feeling is one of the most powerful elements for good, and the strength and safety of the social building is to be tested, not by the state of the attics and upper storeys, but by the state of its foundations.

The self elevation of the working classes is, therefore, one of the brightest hopes of the country. Instead of frowning upon it, or regarding it with coldness and distrust, all Christian and intelligent men should rejoice in its progress, and seek to direct all its movements for good.

Men who have Risen from the Ranks.

II.—GEORGE STEPHENSON.

Watt is an inevitable name in biographies of the nature we have undertaken, and must, in due course, appear here. We confess to a partiality for Pallissy the Potter. Ebenezer Elliott's—one of the few poets who was able to attend at once to business and song, who sold good iron and made good verses—is certainly an instructive life; but we elect this week to take George Stephenson.

It is a matter of pride in every coal mine in Britain that a pitman has a statue standing firm and proudly on the upper earth. As the traveller enters Newcastle, there meets him, in the spacious area between the railway station and the *Chronicle* office, the statue of George Stephenson, supported at the base by four bronze massive pitmen—a noble and appropriate statue. Never was statue won more worthily in all the annals of labour than this one of George Stephenson. The present writer was at the inauguration of it. Lord Ravensworth, who made the speech of the day, said, gracefully, "that it was one of the glories of his house—the glory on which his family prided itself—that they afforded the great pitman the early encouragement which led to his fame." This was true, and nobly said.

Not far from Newcastle—some eight miles—is the village of Wylam. The Carlisle and Newcastle Railway runs by it, and, as it were, on the margin of the line stands the house where Stephenson was born, on the 9th June, 1781. His father was a fireman in a Wylam colliery. His wages were twelve shillings a week, and on this slender sum he brought up six children, of which George, the great engineer that was to be, was one. Eight persons, boarded and clothed on eighteenpence a week each, may be fairly described as a working man's family with very moderate expectations.

Young George began his career as a cow-boy, on wages of twopence a day. He rose to fourpence a day at farm work, and afterwards commenced in the capacity of a "picker" in a colliery, at sixpence a day. Before he was sixteen years old, he was earning twelve shillings a week, when he exclaimed, "Now I am a made man for life." From his post of fireman—which, like his father, he held—he rose to be plugman, at somewhat higher wages. His duties as plugman were to see that the engine was kept well at work, and to descend to the bottom of the shaft and plug the suction tube, when holes in it betrayed themselves.

Up to the time when he was eighteen years of age he could neither read nor write. His sole education was the engine. It exercised a fascination over him. It was the wonder and charm of his life. He loved it like an animate thing. As children cut open the bellows to see where the wind comes from, so young Stephenson, in his leisure hours, took the engine to pieces, to see what the steam did, and how it did it. He thus came to understand the engine—to know all about it, and acquired so much skill in its ways of working, or stopping working (to which engines in those days were much addicted), that he acquired the fame of an "engine doctor," and many a wheezy, coughing, consumptive, rheumatic machine he restored to decent health.

He was thirty years of age before his average regular wages were a pound a week; but as he was never idle—always sober and thrifty, ingenious and fertile—he found means of increasing his income. He learned to sole shoes, and his greatest delight was to perform that operation

upon the shoes of a young maiden, one Fanny Henderson, whom he courted, and subsequently married. Then he made shoe lasts, which paid better; he cut out clothes for colliers' wives to make up; he became an expert at clock cleaning. Whether he discovered the art of boiling them is not recorded; but many wayward timepieces amended their manners after passing through his hands. All sorts of contrivances for diminishing wear and tear in colliery machinery were invented by him. He made such improvements underground that sixteen horses were found to be sufficient where a hundred were needed before. His value was discovered by his employers, and he rose into local importance, and commanded greatly increased wages.

His first great invention was the miner's lamp, since known as the "Geordie." Stephenson's lamp was invented prior to Sir Humphrey Davy's, and was a better contrived lamp for practical purposes. Sir Humphrey, better known, wealthy and popular, carried the day, and the colliery owners presented him with £2,000 and Stephenson with £100. He, however, had the good sense to accept it.

The wild, brave, adventurous, passionate, original, shock-headed Trevethick had a more daring genius in the same walk than Stephenson; but Stephenson was the healthiest minded inventor who ever arose. Sagacious, patient, persevering, modest, and sure, he never made a mistake, nor lost a friend, nor threw a chance away. His next discovery was the need of new tramways; indeed, he invented them. He mastered the principles on which they must be, and have since been, constructed, and found Lord Ravensworth and other far-seeing proprietors of colliery property, willing to aid him in constructing them. He went to school to learn to read, that he might study records of engineering improvements, and he soon invented the best locomotive then known. He made the first that would go. He did not, however, call it a "locomotive." He gave it a more graphic and sensible name. He called it a "Travelling engine." His talk as to what could be done was confident, but he never predicted until he had triumphed. When he had made his famous engine—which he called "Puffing Billy"—to go, he had a right to be confident; and, when distinguished people who came to consult him said, "But, Mr. Stephenson, the thing can't be done; you can't make a machine walk," he would reply, "Look at Puffing Billy. Billy does walk." He took them to Wylam, and said, "Wait till Billy comes up, and then judge for yourself." This was the most sensible thing to do.

In this way he satisfied and converted Mr. Pease, the eminent Quaker, who engaged Stephenson to construct the Stockton and Darlington Railway, the first ever opened in England. A prize of £500 was offered for the best travelling engine. Stephenson then built his famous "Rocket" engine. His was last on the list; but it was the first that was ready. Stephenson was always ready. His "Rocket" won in the great race which decided the destiny of the railway world. Ten miles an hour was the greatest speed then conceivable. The "Rocket" ran twenty-nine miles. The famous engine is now to be seen standing—a noble trophy—at the Darlington Station. No one had then any idea that passengers could be carried by steam, and when the attempt was made, old mail-coach bodies were brought and stuck upon trucks, and some of them still run on the Darlington line. The idea of building such carriages as we now see had entered no man's mind.

When Fanny Henderson—whose shoes had been so lovingly soled—died, one child survived, named Robert Stephenson, who also became a great and prosperous engineer. The father laboured in his struggling years to give him a good education. In all relations of life George Stephenson was exemplary; and when fame and fortune were his, and, towards the close of his life, he used to speak to members of mechanics' institutions, he always used to say, "I owe everything to *perseverance*." It was a favourite word of his. And "when," as one of the reviewers of his life, once said, "perseverance gets into a Northumbrian brain, it will do a great deal." It will in any brain, if united to George Stephenson's industry, self-denial, watchfulness, thoughtfulness, good temper, good sense, and experimental turn of mind.

Inauguration of the "Working Man."

A soirée on rather a large scale was given by Messrs. Cassell, Petter, and Galpin, the publishers, in the large room of their establishment in La Belle Sauvage Yard, Ludgate Hill, on Saturday evening, January 6th, to their *employés*, for the purpose of inaugurating the publication of the WORKING MAN. The company consisted of upwards of 300 persons of both sexes, including a few invited guests, who were more or less interested in the firm. The room was handsomely decorated with flags and evergreens; the London Stereoscopic Company lent some beautiful water-colour drawings, photographs, and stereoscopes; Mr. Rimmel, the well-known perfumer, contributed scented fountains and evaporisers, and perfumed bouquets; and Mr. Benson, the jeweller, of Ludgate Hill, kindly furnished a number of beautiful statuettes and other works of art, candelabra, and the elegant tea-urns which adorned the tables.

A liberal tea having been enjoyed, ALDERMAN LUSK, who presided, made a very appropriate and genial speech, and after some jocular observations, said—"Ladies and gentlemen, workmen, wives, sweethearts, and friends, I wish you all a happy new year. (Applause.) The new year has always certain associations about it. We have all had our troubles. The nation has had its troubles too: it has lost Lord Palmerston, Richard Cobden, and other great men. We all have lost friends, and we have all had our anxieties; still, we have had many successes and many comforts, and therefore we ought to look forward with hope to another new year. We are delighted to say, 'A Happy New Year.' We have some gleams of sunshine, and everything looks beautiful: there is some dulness, but still, upon the whole, I think we all agree that we ought to be thankful that the nation is prosperous and progressing. We are always improving—progress goes on, and now and again (I tell you this as a fact communicated by Macaulay) 'a single wave may recede, still the tide of progress is rolling on.' (Cheers.) It is not long since working men first assumed that respectable position they now occupy in this country; nor had we workmen to occupy the large place they now do in influencing the future destinies of this nation. They occupied a very different position fifty years ago. May they go on and prosper. (Cheers.) I might mention, as a pertinent instance, the efforts of our esteemed friends, Messrs. Cassell, Petter, and Galpin, in bringing out a new publication called the WORKING MAN. (Loud and prolonged cheers.) On this very day, the 6th January, 1866, that new organ has seen the light, and we have met here this evening to say, 'Welcome, *little* stranger.' (Laughter.) Not such a *little* stranger, either—fine boy, wonderfully like its parent; sharp, clear eye, can see things all around, a powerful arm to help a neighbour, and a strong limb, that I have no doubt can kick when occasion requires. I am sure that you will be all glad with me to wish success to that publication. (Applause.) We have met here this evening to inaugurate that publication, and I hope it will be successful. I tell you there is great room for a paper that will advocate the interests of the working man. Never forget that we have about 1,000,000 of paupers and upwards of 3,000,000 of men not far above them. We have in London alone 7,000 policemen to keep down drunkards. It costs us nearly £1,500,000 per annum for the expense of these men. Altogether, for this purpose, £3,500,000 are expended annually throughout the country. The object of this publication is to advocate such principles as will ultimately lead to the maintenance of public order without such expenditure. I am glad that I am able to say that, owing to the enterprising spirit of Messrs. Cassell, Petter, and Galpin, we have a paper, well printed, well conducted, and in every respect calculated faithfully to represent the interests of the working classes. I am glad to see a new labourer coming into the field to assist in the cause of reform. I hope it will be successful, and that everything will be consistent with the best interests of the working classes. I hope it will progress. I hope that the working classes will support it, and I hope it will be a leader and a guide to those who look at its columns. I hope that it will be conducted in a fair and proper spirit (indeed, I am sure it will, from the high character of its literary staff, and the well-known reputation of its publishers), and that it will encourage the timid and feeble, and teach ignorance to see and grief to smile."

The song written for the occasion by Mr. Plummer, "The Working Man," which appears in another column, was then sung by Mr. D. Cox.

Mr. GALPIN then rose, and was received with enthusiastic applause. He said—"Mr. Chairman, ladies and gentlemen, and working men, the warmth of your reception has added another difficulty to that which I felt in responding to the call made upon me. I certainly feel some difficulty in doing justice to the subject on which I am called upon to speak. Before I proceed further, I must claim your indulgence in adverting briefly to another subject. You all know that my worthy partner, Mr. Petter, is absent through illness, and that he would be happy to be present tonight to give expression to the feelings which animate us—the pride we all must feel in being assembled on such an occasion. (Hear, hear.) Permit me to tender especially on his behalf, and on my own, to the ladies and gentlemen who have honoured us with their presence, our hearty thanks. (Applause.) My name has been put down to speak to the toast of the WORKING MAN; but I must say a few words as to the character of the relations between the employers and the employed. It is now about sixteen years since we have been associated together, and I am happy to see around me so many faces which have been familiar to me during that period—most of you for the greater part, and some for the whole of that time. During that period my great sorrow has been that our gatherings have not been so full as at present. Formerly, the men only attended; but you know how I have 'hammered' away to get the sweethearts and wives to attend on those festive occasions. (Cheers.) Now, this is the first time I have had the gratification of saying, in addressing my co-workers, '*ladies and* gentlemen.' Now, ladies, I must say (and I say it with all deference) that we have had pleasant hours without you (laughter), but not so pleasant as I am sure they will be with you this evening. I hope I may be excused for touching on another subject in connection with the history of this firm. Our chairman has reminded us of the losses which the country has sustained during the last year, and I need hardly refer to the very great loss we have sustained by the death of Mr. Cassell (hear, hear), himself a working man. I do feel strongly and deeply when I think of the vacant space which he would so ably fill on an occasion like the present. Most of you know how heartily he always entered into the spirit which animated our meetings. Excuse me if I feel strongly in this passing tribute to a dear departed friend. (Applause.) Now what are the objects of the WORKING MAN? I may sum them up in a very few sentences. One of them is to promote such happy meetings as the present. We have worked long enough together for you to know and appreciate the kindly feelings which exist between us as employers and employed, and that those relations have been of a very happy character. (Hear.) I hope that good feeling will be promoted by such meetings, and that the WORKING MAN will promote unity and strength of purpose among the working men themselves. Every working man has within himself the elements of power. He has skill, which is his capital; and if working men will only unite their varied powers, they can bear down everything opposed to their real interests. (Cheers.) If the working bees unite, they will soon drive out the drones, who misappropriate the results of honest industry. When I speak of working men, I do not mean those only who work with their hands. I believe I may class myself as a working man, and I hope you will regard me as such. We are all working men, and, as such, we ought to struggle together to accomplish the grand objects of this paper—namely, to promote peace and goodwill among mankind. (Cheers.) This may be done in many different ways. However, I must not dilate upon this subject, as there are many other gentlemen who will have to address you, likely to touch upon this topic. I must congratulate you on the proud position which the working man is sure to achieve for himself, and the aid which the WORKING MAN will render him in accomplishing that desirable object. I hope the time is not far distant when the clouds of ignorance shall be dispersed, and the light of Christianity shall illuminate and bless the whole of our beloved country. In conclusion, I thank you for the honour you have done me on this happy occasion." (Applause.)

The addresses—each speaker being limited to ten minutes—were then commenced by Mr. SHORTER, Secretary of the Working Men's College, on the subject of "Working Men's Colleges."

The Rev. R. MAGUIRE, M.A., addressed the meeting on the subject of "Social Elevation." Instruction signified the laying up stores in the mind, while education was the drawing out and manipulating those stores, so as to feed the hungry mind, and those who so use those stores are the real educators of the people. (Cheers.) You could educate a tree so as to promote its growth and beauty; and so can man be trained and formed, so that all the elements of goodness and power in him may be duly developed. (Hear, hear.) In his college days he had known several young men who were deeper readers than himself, who used to lay in great stores of knowledge, but who failed for want of the faculty of reproducing them, and turning them to profitable account. Every one who read should be like a star in the firmament, receiving light, and then giving it back. In the one case he would be the "instructor," in the other the "educator." In the first instance he would deposit the seed, in the next he would bring forth the fruit; the one is the capital, the other the dividend; the one is the food of the mind, the other the digestion. (Cheers.) Aim at truth! That, after all, was the golden nugget,

and the man who discovered it received it in trust for his fellow-men.

Mr. MURPHY made some eloquent and able remarks on the subject of the "Homes of the People."

The Rev. DAWSON BURNS spoke energetically on the subject of "Self-help." Abraham Lincoln was a great self-helper; so was Mr. Gladstone, though with much greater advantages. They ought all to help themselves, remembering that self-help included self-reliance and self-restraint, and imposed the duty of helping others. The late Mr. Cassell was an eminent example of a man who, having risen by self-help, was always ready to extend a helping hand to others.

The Rev. H. SOLLY, on the subject of "Clubs and Institutes," dwelt upon the reason why working men should enjoy the advantages of clubs as well as those who ranked higher in social position.

Mr. GEORGE WALLIS was then called upon to speak on "Art and Handicraft." Workmen, while recognising use as the fundamental idea of the production, should strive to cultivate a sense of beauty, so that they might adorn the work they made: thus imitating Nature, in which beauty is an essential element. As an artist himself, he knew the pleasure which attended a reverent study of the beauty of Nature, and workmen would feel that too, if they opened their minds to its influences.

The Rev. T. TEIGNMOUTH SHORE, M.A., was loudly cheered when he presented himself. His subject, he said, was "Popular Literature;" but, as time was short, he would confine himself in his remarks to the periodical whose birth they were commemorating. It would advocate every principle which could benefit and elevate the working man, and make him fitter to appreciate the blessings of his position as a member of a free community, living under the noblest constitution in the world.

Mr. JEFFERY moved a vote of thanks to the Chairman, who genially responded.

Between each address there were songs, glees, and quartettes, admirably sung by Miss Ellen Lyon, Miss Pettet, Mr. Theodore Distin, and Mr. D. Cox.

On quitting the room, Mr. and Mrs. Galpin were loudly cheered; and the company broke up highly delighted with the proceedings of the evening.

PARISIAN TOYS FOR THE NEW YEAR.

A LIVELY correspondent of the *Times* writes from Paris:—If we may judge by the increasing extravagance in the manufacture and decoration of the trinkets and toys which this year encumber the shop windows in the fashionable quarters of Paris, it is evident that the heroic burlesque of the New Year's Day comedy is not near its end. A young lady or gentleman of seven will look with supreme scorn at any toy that costs less than 150f., and I have heard of instances where this was sent back to the giver with ironical thanks. There are effigies of Punch that cost 1,000f., and dolls from 3f. to 4,000f. For the last fortnight you might see crowds stationed before the windows of a well-known confectioner in the Rue de la Paix, admiring the *bonbonnières*—for it is the box or the *sac*, and not its contents, that is so highly prized—of the latest fashion. This specimen of Parisian ingenuity, this *sac aux bonbons*, is represented by two ladies, one of the First Empire, the other of the Second—the one of 1806 in grand costume, glittering in gold and precious stones, and with a train of crimson velvet, which she holds up with one hand; and the one of 1866 in a dress of green velvet, embroidered with escutcheons, and covered over with garlands of flowers. The deficiency in the "body" of the dress is great, but is more than compensated by the vast amplitude of the lower part; and it may be said that never was court train or crinoline turned to better account, for it is in them that the bonbons are contained. These Imperial dolls cost 25,000f. apiece! There are others a little cheaper, intended as portraits of the principal actresses of the minor theatres.

Side by side with these gorgeous toys, on which so much art and industry are expended, you have the old booths on the Boulevards, from the Madeleine to the Bastille, which are authorised to be kept open for a period not exceeding fifteen days. They are mostly put together with rough planks, are got up during the night in a few hours, and serve as bazaars for toys, many of which are within the reach of the poorer classes. The number of these temporary structures, which present so striking a contrast to the rich shops in front, seems to diminish a little. Last year there were about 2,300; the present counts some hundreds less. The traders of this cheap fancy fair consist of petty manufacturers working at home, who profit by this occasion to exhibit and sell their products; small shopkeepers in the remoter quarters, who manage in this way to get rid of their superfluous stock; and artisans out of work for the moment, who have invested their savings in that speculation. Cheap *articles de Paris*, German toys for children, oranges and sugar-plums, form the staple merchandise, though you see here and there articles of cabinet-work, not certainly the pick and choice of the Rue St. Antoine, but still bearing marks of the taste which the French mechanic impresses on all his produce. When the weather holds up, trade is brisk, for the Boulevards are thronged, and few pass without a halt at the *baraques*.

Position of Co-operation.

VERY many intelligent working men do not understand Co-operation. Like Life Insurance—a much older, and far more popular thing, which has never received the thoughtful attention of perhaps not a third of the working classes—Co-operation is as yet comparatively unknown. Even quarterly reviewers, with great pretensions to wisdom, and with the best opportunities of acquiring information, publish the oddest judgments of it. Thoughtful writers in less notable quarters, editors of great trade organs, and respectable merchants, the very greybeards of commerce, are continually publishing pamphlets on "Rochdale Fallacies," and so forth. No wonder, then, that working men should be what Mr. Roebuck said once in the House of Commons that the late Sir George Cornewall Lewis was not—"obfuscated" as to Co-operation. No wonder if many who think there is something in it, do not know what that something is, and others suspect it altogether.

Co-operation is one of the new social forces of the age. It is without doubt a new power of industry. It enables a man to save money without working for it—to grow rich, or, at least, attain to competence, without using any portion of his wages. This is a secret worth mastering; and, strange to say, although the secret has been published pretty extensively, a very small number of towns are in possession of it. The number of great Co-operative Societies is very few. The number of important towns without any society at all is considerable. Few social facts are more curious than to contemplate the towns where Co-operation succeeds, and where it fails or languishes. Towns sharp as Sheffield, robust as Birmingham, critical as Glasgow, ambitious as Edinburgh, instructed as London, find the problem too much for them, while in a hundred likely towns and cities it has not even been attempted. Yet, in third-rate, improbable places, triumphs have been achieved which have altered the character, changed for the better the fortunes of the whole population, and raised the character of England for industrial tact and social wit beyond any nation of the earth.

This is no extravagant thing to say, though it sounds like it. It is an unexaggerated statement of facts. Statesmen, political economists, statisticians, and other inquirers of eminence, anxious to assure themselves of the reality of the new phenomenon entitled Co-operation, have paid visits to the town of which the late Mr. Cobden was the representative. Nor has the curiosity been confined to our own country. Professors from Germany, political economists from Paris, even from Russia, from America, and from India, students of social science, have come, attracted by the fame of Lancashire Co-operators. There must be something in a new scheme of industrial action whose fame is bruited so far. For a time it was admitted that this new discovery, or resuscitation, to speak historically, "might answer for a time, as all new things, which attain popularity, do; but it had yet to be tried. The day of trade adversity would come, and then the world would see how it would stand the trial." The evil days did come. For four years the industry of the great manufacturing centre of England was paralysed, when, to the gratification of its friends, and surprise of the public, Co-operation in its double form—as applied to provision-store keeping and to manufactures—not only withstood the storm, but struck its roots deeper in the ground than ever. This new power is, therefore, an "established fact," and entitled to be dealt with accordingly. As yet it is in its infancy. Its uses are unknown in their totality. Its new applications are, to use a phrase Mr. Dickens does not like, "cropping up" in places unexpectedly, we might almost say daily. And yet organised bodies of workmen, as trades unionists, have not commenced to use it; although their combination is ostensibly intended to secure the prosperity and independence of their order. The applications the wealthy may make of Co-operation is greater far than the industrious classes have yet been able to accomplish.

Eight years have elapsed since the history of the Rochdale store was closed. Since that date remarkable historic progress has been made. Also there has arisen, with a suddenness as remarkable as the growth of the iron city of the north—Middlesborough-on-Tees—the great Industrial Society of Halifax, whose history is as full of interest as it is replete with instruction.

The journalism of Co-operation has been very earnest, but it has not been of an exhaustive character. The department of suggestion has been little cultivated, and scope has been left wide enough for very different—certainly, additional and, we hope, useful treatment.

Co-operation is a scheme in which all who join in the work share the profits. Its object is to enable, as far as possible, all who contribute by labour or skill—by judgment or ingenuity—to a successful working scheme, to become common participators of the common profits. The simplest form in which this principle is applied, is that in which a number of people of small means join together to open and conduct a Provision Store. This form of Co-operation was first adopted, because a small capital will yield an immediate return; and since all the members are eaters, and the poorest commonly the greatest, every member can become a dealer at the store, and help to increase the general profits. Indeed, a man with a large family is a more valuable member of a Co-operative Society of this kind than a man with a small one, since he must purchase more provisions; and the more he purchases the more profit he makes to the society. At first, a very cheap room is rented for the store. The members buy such articles as they think they can sell, and commonly buy them badly. They do not know genuine articles when they see them, and seldom know where to find them, if they did. They are necessarily shut out from the best markets, not having sufficient money to purchase in them. Inexperienced as shopmen, they do not know the best methods of preserving goods for which they have not an immediate sale. At first goods are sold only at nights, when the workmen come from the mill who act as shopmen without payment. After a time, when these night shops begin to afford a small profit, the members increase, and a day shop is opened for the convenience of families. Instead of workmen taking home the provisions at night, their wives come and buy them in the daytime. Curious steps are often taken, and curious disasters often occur, before an encouraging rate of profit is reached.

When this desirable, though often long deferred period arrives, the attention of the members is turned to the minor departments of manufacturing. A small capital is subscribed to furnish a shoemaker's shop with a slender supply of leather and lasts; and then the hammer of the busy cobbler, or cordwainer, as he now delights to call himself, is soon heard rattling on the soles of Co-operative shoes. The next step is to fit up a shop for that universal and indispensable artificer—the tailor. Another subscription of capital is made to purchase cloth and needles; and shears are soon heard clinking in arriving at the varying shapes of the sturdy Co-operatives. In mill districts clogging is a popular department of primitive manufacture. In more agricultural districts an oven is put up, and baking has an early turn. The profits, after all expenses are paid, are divided quarterly and equitably among all the members, in proportion to their purchases. Here comes the turning-point of the fortunes of the store. If the members have confidence and good sense, and leave their profits in the hands of the store, to accumulate as capital for the extension of the store, it is sure to thrive, and the members make surprising gains. But if they withdraw their profits as soon as made, the members learn no thrift—accumulate no savings—the store makes no way, the goods become worse, the members acquire no enthusiasm, the store languishes, and commonly comes to grief. The Rochdale store, when it began in 1844, took only a few pounds a week over the counter; now, they take nearly £120,000 a year. There are stores in existence, much older than Rochdale, that scarcely take a thousand pounds a year now. The secret of success consists in the members saving their savings, instead of spending them.

The second form of Co-operation is that in which the principle is applied on a large scale to manufactures, to buying or building spinning mills, and stocking them with machinery. The capital required for this varies from £5,000 to £30,000. The principle of Co-operation, as applied here, involves a much higher degree of good sense, good feeling, and judgment. It consists in extending to every workman, as well as to every shareholder, an equitable participation in the common profits, produced by the common skill, industry, and carefulness. This problem has not yet been worked out. There is scarcely half-a-

dozen factories founded on this principle. There are large numbers bearing the distinctive and honourable name of "Co-operative" concerns, which have no right whatever to the title, and in all correct classification of them are excluded from the list. They are mere joint-stock associations—a bastard form of Co-operation, in which the workman is left out of consideration altogether.

In Germany Co-operation assumes a form it has never attained in England, fulfilling the function of a sort of universal loan society for the assistance of industry. In America Co-operation has been made susceptible of far larger views than in Europe. In England it has looked no farther, excepting in the minds of early Rochdale Co-operatives, than to making new profits. In America it gives signs of consulting the dignity of labour. The Co-operative principle is no doubt capable of effecting that "organisation of labour" that was heralded some years ago with great eloquence by a French historian, the realisation of which has, until lately, remained in the region of prophecy. The means of realising it were never apparent until the latest stages of Co-operation were reached in Rochdale and Halifax. In Rochdale the members of the Co-operative Society exceed 5,000. In Halifax they equal the same number. In Rochdale the Co-operatives are masters of the social situation. The working class are their own merchants, their own builders, their own bankers, and will soon be their own employers. When they hold a members' meeting it assumes the proportion of a town's meeting. The largest hall in the place will not hold the half of them. In Halifax, when the members hold a tea-party, they are obliged to engage the two largest public halls—the Odd Fellows' and the Mechanics' Institution—and then they are not able to accommodate two-thirds of their members. It is thought a great thing when a wealthy manufacturer builds a church or presents a park to his neighbours. The collective Rochdale Co-operatives could afford to build a new church every quarter out of their profits; and the Co-operatives of Halifax might present a park to the town every half year. During the cotton panic time the Rochdale Societies subscribed more than many large firms for the relief of the distressed. Before the days of Co-operation, workmen were ever the distressed, now they take their place in the influential ranks of those who relieve public distress. Certainly the principle of Co-operation is entitled to exposition.

Things Talked About.

ACTIVE measures for providing homes for the thousands upon thousands of working people who are threatened with eviction, to make way for metropolitan improvements, and new railway extensions and stations, cannot longer be postponed. Something, of course, must be left to private enterprise, which is generally tolerably active when a profit on outlay seems probable; but a greater power than that must be brought into action. We are glad to see that the guardians of the Strand Union—one of the districts especially affected, for there the new Courts of Law will be erected—are setting to work seriously, and calling upon other parishes to help them to secure legislative consideration of the subject, as a preliminary to the discussion of the merits of the numerous railway bills of which notice has been given. The resolutions agreed to are given in another column.

What an appalling letter is that of Dr. Jeaffreson's to the *Times*, on the subject of fever manufactories in London! He has been investigating the sanitary condition of Lambeth, Southwark, Bermondsey, Bethnal Green, St. Luke's, St. Giles's, and other unsavoury localities. He found sewerage and water supply scandalously deficient, wet walls, foundations of small houses sodden with filth, whole families crowded into little rooms; overcrowding and filth everywhere, cleanliness and decency at a sad discount. And all that in the greatest and wealthiest city of the world! The owners of such wretched, but, it would seem, profitable house-property, are predominant in the vestries, and what can health officers do?

Mr. Buckmaster, who has had as much experience of the working of Mechanics' Institutions as most people, has made an assertion which will startle many who look upon such institutions as a great means of mental improvement. He said at Newport, a day or two since, that "as institutions are at present conducted, it may safely be asserted they do more harm than good." Solid instruction in art, literature, and science, he says, is neglected, and the lectures are monopolised by "small jokers, washy sentimentalists, and vocal punsters." So-called musical lectures he especially denounces, and says their efforts would scarcely be tolerated in a respectable tavern. Committee-men and secretaries will do well to think of these matters.

If, however, institutions which were established to aid youth and adults in the great work of self-education, have really fallen from their high estate, it is gratifying to know that Londoners, at least, will soon enjoy the advantages of middle-class schools, where the children of working men may receive as good an education as that given at some first-class public schools. The plan suggested by the Rev. W. Rogers, of Bishopsgate, has been so warmly taken up, that the sum of £50,000 originally fixed upon as necessary for the establishment of such a school, will probably be doubled. Twenty-eight persons, or firms, have already given £1,000 each to the fund.

Another movement in the City is spoken of—nothing less than the establishment of a great Free Library. London should not be behind Liverpool.

The records of the Victoria Cross, or the French Legion of Honour, scarcely describe a more daring or heroic act than that performed last week by a working man, a fireman employed on the North Eastern Railway. An engine was started by accident from the Durham station, and dashed along at the rate of sixty miles an hour, with nobody to control its movements. When it passed Washington station, a driver named Gilchrist, and his fireman, Batey, detached their engine from a train, and started in pursuit on the parallel line of rails. The race lasted for nearly ten miles, and the runaway was not overtaken till it was within half a mile of Gateshead; then Batey, the fireman, leaped from his own engine, secured his hold of the other, and putting the brake on, stopped it. It was a gallant deed, and perhaps saved scores of lives.

The Post-Office Savings Banks are a great success; but they have not absorbed all the savings of provident working men, as may be seen by the report of the Finsbury and City of London Savings Bank, which shows that, during the past year, there has been an increase of over 500 depositors, and of £14,000 in the value of deposits. This looks well for the prosperity of industrious and thrifty working men.

If any of our readers meditate emigration—though we think that what we have just said shows that a good living, and something more, is to be obtained at home—we would advise them not to turn their attention to British Columbia or Vancouver's Island—at least, not for some time to come. Perhaps the gold fever will wear itself out, and then the natural riches of the country may be turned to better use. A letter in the *Toronto Gazette* describes the country in the most glowing terms. As a pastoral district, British Columbia surpasses every other province of British North America. The fisheries and timber trade are apparently illimitable, or the extent to which they might be developed. But—there is generally a but somewhere—there are distress and starvation prices for everything; money, notwithstanding the gold found, is so short that twenty and twenty-five per cent. is charged by the banks for a month's accommodation, and business is, of course, crippled. A stronger proof that real wealth is something more than solid metal could scarcely be given.

We have not come to eat horseflesh yet, and are not anxious to emulate our neighbours across the Channel in that respect. There it is in favour, and a regular horse-butcher is now established and duly licensed for the supply of meat for family use.

The establishment of village hospitals is a welcome fact. One of these at Cranley, in Surrey, has been fairly in operation for six years, and serves as a model for several others now being started. The Marchioness of Aylesbury is establishing hospitals of the kind on her Wiltshire estates. A roomy farm-house, or similar building, is taken, properly furnished with beds, a good surgeon and experienced nurses are engaged, and there at once is a place whither the sick labourer and his family, or the unfortunate victim of an accident, may be taken, properly attended to, and enjoy comforts, cleanliness, and skill, which he might else wish for in vain.

The Kidderminster carpet weavers have struck, in opposition to the desire of the masters to introduce more apprentices into the trade, but have, after some discussion, consented to a compromise, which limits the number of the youths so employed. A sad loss to the men might otherwise have been the result of the strike. A similar effort was made some seventeen or eighteen years since by compositors, and failed. To endeavour to maintain a monopoly by restriction of the number of labourers, old or young, is one of the weakest of delusions. Lads must work, and have a right to work, and it is the interest of all fathers that the rights of their sons, as well as their own, should be looked to; but it cannot be supposed that masters will teach them their business without requiring some remuneration, in the shape of a share of the wages earned by the apprentices. There have been some unpleasant altercations on this subject in Sheffield. The apprentice laws need revision, we know, but that is another question altogether.

The Bristol dock-porters have struck for higher wages. They seem to have forgotten that mere labour without skill is always abundant; and the fact that their places are being rapidly supplied by strong young fellows, well fitted for the laborious work, will, we trust, prove a warning for the future. We are glad, by the way, to hear that the strike of the South Yorkshire colliers is at an end.

Several Burial Clubs have just "come to grief," as sporting men say, and been declared bankrupt. One of the best services intelligent working men can do their worse-informed companions is to warn them against subscribing to societies which are so rotten in basis as many of those in which the hard-earned savings of poor people are so often invested and lost. On this subject we shall endeavour to supply our readers with sound information. A London clergyman has made known a case which occurred in his district. A family of seven were literally starving in one little room, without a bed to lie upon; their furniture had been seized for rent, which they had failed to pay, having exhausted their means in providing a funeral for the old grandmother, who had subscribed to three burial clubs, in order that, at her death, she should be no burden to her surviving relatives. All the clubs had ended in bankruptcy!

General Information.

CLUBS.

ST. JAMES'S AND SOHO.—This club inaugurated its entrance into new and commodious premises in Rose Street, Soho, on Monday evening, by a public meeting, held in the hall of the club, under the presidency of Henry Hoare, Esq., Jun., who is its treasurer. The meeting was only moderately attended; but those who came were men of the right sort, and a considerable number of the new comers joined the club at the close of the meeting. The speakers, besides the chairman, were Hodgson Pratt, Esq., Chairman of the Executive Committee of the Working Men's Club and Institute Union, the Rev. H. Solly, Mr. Matthews, president of the club, Mr. Turley and other working men. A hearty tone of earnestness and hopefulness seemed to pervade both the meeting and the speeches. This club was originally established at a public meeting, held in St. Luke's School-rooms, Soho, presided over by Sir John V. Shelley, M.P., and has received much kind support from the Incumbent of St. Luke's—the Rev. Harry Jones; but it has strikingly illustrated the enormous difficulties working men have to contend against, in procuring premises for club purposes. By the kind liberality, however, of Mr. Henry Hoare, Jun., who has guaranteed the rent of the new premises, aided by the valuable co-operation of the Rev. Harry Jones and the Rev. H. Solly, and the exertions of a few working men, who have stuck to the club indomitably through all its adverse fortunes, it appears to be now placed on a sound and permanent basis. If the working men generally of the neighbourhood will now come forward, and show their appreciation of the efforts made for their enjoyment and benefit, this club may become one of the best and most useful in the metropolis. The Hon. Sir Frederick Grey, who was chairman of a club that recently existed in St. Martin's parish, visited the club in Rose Street last week, in company with Mr. Hoare, and announced his intention of lending the furniture of the late St. Martin's Club to the committee, also expressing his best wishes for its success.

EXHIBITIONS.

THE LATE WEST LONDON EXHIBITION.—It is stated that two of the guarantors of the West London Exhibition—Messrs. Harris Heal, of Tottenham Court Road, and J. Hansler, of Lincoln's Inn—have examined and certified to the accuracy of the accounts, and have authorised the guarantors being called upon to the full amount of the money for which they guaranteed. The debts resulting from the exhibition amount to about £1,300, and the sum guaranteed between £1,300 and £1,400. The committee, it is stated, will lose no time in collecting the money and meeting all demands.

CITY OF LONDON WORKING CLASSES' INDUSTRIAL EXHIBITION.—A meeting of the patrons, guarantors, and general and executive committees, was recently convened by private circular at the London Coffee House, for the purpose of appointing a space and decoration committee. The honorary secretary (William Ramsey, Esq.) read a report, drawn by the secretary (Mr. J. R. Whorlow), which set forth the origin and progress of the exhibition up to the present time, and stated that the Corporation had granted the use of the Guildhall in which to hold the exhibition, in March, 1866; and that the surplus funds (if any) would be devoted to the foundation of a free public library for the City of London. This announcement gave the greatest pleasure to all present, and the chairman liberally offered to convert the amount of £25 guaranteed by him into a donation in aid of such a laudable object. Several gentlemen spoke in terms of praise as to what had been done, and as to the future prospects of the undertaking. Mr. J. T. Bedford said he was prepared at the proper time, and with the authority of the committee, to make an application to the Court of Common Council for £500, for the purposes of the exhibition.

SOUTH-EASTERN INDUSTRIAL EXHIBITION.—The closing ceremony of this exhibition is announced to take place at the Painted Hall of the Royal Hospital, Greenwich, on the afternoon of Saturday, the 27th inst., when the prizes and certificates will be awarded to the successful exhibitors by Viscount Sydney, Lord Lieutenant of Kent. The exhibition, which was opened in October last, has proved entirely successful, and will be closed to visitors this day, Saturday, the 13th inst.

LEGAL DECISIONS.

A TRADES ASSOCIATION.—The Liverpool Shipwrights' Association has been summoned by two of its members, to enforce a restoration of privileges, of which the plaintiffs had been deprived. Because the complainants had worked lump jobs, they had been expelled from the association, the object being to compel shipowners and masters to employ extra hands for all extra work required to be done. The magistrates ordered the complainants to be restored to full privileges, including sick and annuity allowances. Mr. Bremner, who appeared for the association, said that the men had not been legally expelled, as the resolutions referring to them had been passed under a misapprehension.

WAGES.

WAGES IN NEW ZEALAND.—Good general servants rate from £30 to £35, £40 being the very highest wages given in private families. Housemaids, £30; nursemaids, £20 to £26; women cooks in hotels, £1 per week to £2 10s.; men cooks, ditto, from 50s. to £3 10s.; housemaids for hotels, 15s. to £1 per week; kitchenmaids, £1 per week; scullerymaids, £30; barmaids in Dunedin, £2 per week; ditto, up country, £2 to £3 per week; ditto to west coast, from 50s. to £4 per week. Male servants—Grooms, £2 per week; married couples, from £75 to £100 per annum; coachmen, £2 per week; gardeners, £1 to 50s. per week; shepherds, from £50 to £70 per annum; bullock drivers, 50s. per week; shearers, 25s. per hundred and rations; milkmen, 30s. per week; boys, from 10s. to £1 per week. Governesses, from £50 to £100 per annum; dressmakers, 4s. per day, or £1 per week; machinists, from £1 to 30s. per week; milliners, from 30s. to 60s. per week.—*Otago Daily Times.*

WAGES IN THE AGRICULTURAL DISTRICTS.—A Wiltshire correspondent maintains that the Dorsetshire labourers, on whose behalf so much sympathy has been called forth, are not worse off than their brethren in Wiltshire. In the latter county—at least, in some districts of it—the custom is to pay the labourers their wages monthly. Like the Dorsetshire labourer, their usual pay is 8s. per week; and as this comes to them after a month's labour, and in some classes even longer, the money is forestalled, and goes to pay off a constantly recurring debt at the village shop. The shopkeeper, being thus obliged to give credit, naturally indemnifies himself against prospective losses by charging an extra profit; and thus the poor customer, in addition to the misery of being always in debt, has to pay an extra tax on his monthly receipts. But even this is not the whole of the Wiltshire labourer's sorrow. "I was calling the other day," says the writer, "on two of my poor neighbours, both family men, and one of them with a large young family, when I was told that out of the weekly wages of 8s. they both had to endure stoppages for wet days, when they were not allowed to work."

THE RATE OF WAGES AT THE NAVAL DOCKYARDS.—On the occasion of the Duke of Somerset and the other members of the Board of Admiralty paying their official annual visit to Chatham Dockyard, some time back, they had interviews with several deputations from the workmen at that establishment, who pointed out the alleged grievances under which they labour. The chief complaint is the inadequate rate of pay they receive as compared with that given by the leading private shipbuilding firms. Their lordships on that occasion, after hearing the statements of the members composing the several deputations, promised that the subject-matters brought before them should receive attention, with the object of any real grievances being redressed. An Admiralty circular has accordingly been received at Chatham Dockyard. It announces that, after carefully and anxiously considering the subject of a proposed increase of wages to the workmen generally, and having had the opportunity of hearing the frank and respectful statements of the deputations from the various classes of workmen at the recent annual visitation of the dockyard, and at the same time comparing the rates of payments for labour in the Royal dockyards with those of private establishments, the Board cannot recommend Parliament to grant any increase of wages to the workmen. A similar order has, it is understood, been forwarded to all the other naval establishments.

A MEETING of the carpet manufacturers of Scotland was recently held in the Cobden Hotel, Glasgow, to consider the propriety of giving a rise of wages to their workers. Mr. Hugh Wilson, Jun., was called to the chair, when there was read a petition from the Carpet Weavers' Association of Scotland, asking ¼d. per yard of advance on the present prices paid for weaving fine carpets. Mr. George M'Laren moved that the advance asked be given, the same to take effect on and after the 1st of March, 1866. Mr. Murdoch seconded the motion, which was unanimously agreed to. This branch of Scottish industry is in a much healthier condition just now than it has been for a long time previous, owing, we believe, to the cessation of the American war; the carpet manufacturers have now good prospects before them, and several large orders on hand for America.

WORKING MEN'S DWELLINGS.

BURNTISLAND, N.B.—At a meeting held in the Town Hall, Burntisland, N.B., last week, the Provost in the chair, it was resolved to form a building society at once, with a view to procure additional dwelling-houses for the working classes.

RAILWAY EXTENSION AND LABOURERS' DWELLINGS.—The intended terminal station of the Midland Railway Company, between St. Pancras Road and Skinner Street, and abutting on the Euston Road, to the eastward of King's Cross Railway Station, will involve the removal of the houses on the north side of Euston road between Skinner Street and the Great Northern Railway Station (including St. Luke's Church); the houses on the west side of St. Pancras Road from Weston Street to Brewer Street, and from Brewer Street to Welford Street, the whole of Brewer Street, part of Brill Row and Brill Mews, the whole of Perry Street, Smith Street, Weston Street, Hertford Street, and the several alleys, yards, and courts within that area. The number of inhabitants, who are principally of the poorer classes, that will be thus displaced will exceed 20,000 persons. Such will be the effect of the erection of only one of the many great railway works now being constructed or in contemplation in the metropolis, on the already limited accommodation for the working classes.

DWELLINGS FOR THE POOR.—The following is a copy of a resolution moved by Mr. Storr, seconded by Mr. Hedgcock, and carried, at a recent meeting of the Strand Union Board of Guardians:—"That a committee be appointed to inquire into and report to this board upon the existing house and lodging accommodation for the labouring and poorer classes within the Strand Union District, and the extent to which the immediate demolition of small house property for the new law courts in St. Clement Danes, for the railway about to be constructed from Charing Cross to the Hampstead Road, and for other contemplated improvements, will deprive the said labouring and poorer classes of their present inadequate and yet highly rented lodgings. After taking all necessary evidence, the committee to consider and report to the board their views as to the expediency of this board communicating with other boards of guardians of the poor of the various metropolitan unions or parishes, memorialising the President of the Poor-law Board, the Home Secretary of State, the Lord Mayor, the Chairman of the Metropolitan Board of Works, and the several Metropolitan members of the House of Commons, with a view to this urgent public question being at once brought under the notice of the proper authorities by the guardians of the poor, in order that the Government may have time carefully to consider in what way suitable provision should be made for dwellings for the poor, before the parliamentary committees sit upon the very many bills for divers new metropolitan railways and other schemes that will be laid before them during the coming session." Leave was given by the board to the committee to communicate with the boards of guardians of the various metropolitan unions or parishes, with a view to ascertain if they were willing to co-operate in this matter.

NEW PARK.—Finsbury Park, for the formation of which 120 acres were purchased by the Metropolitan Board of Works, situate on the north side of the Seven Sisters' Road, and extending from the Great Northern Railway on the west to the Green Lanes on the east, is to be proceeded with, the difficulties raised by the Edgware, Highgate, and London Railway Company having been removed.

APPOINTMENTS OPEN.

CEYLON CIVIL SERVICE.—Six superior clerks of works are required, for the Public Works Department of the Government of Ceylon. They must be good draughtsmen and thoroughly experienced practical men, able to plan, estimate, and lay out works. Salary to commence at £400 per annum. The persons selected will be entitled to free passages for themselves and families from this country to Ceylon, and will come within the scope of the regulations respecting leave of absence, and of pensions on retirement. Applications, by letter only, stating age, past experience, and present employment, accompanied by testimonials, will be received by the undersigned until the 15th inst., inclusive. As testimonials will not be returned, applicants are particularly requested, in the first instance, to send copies only.—PENROSE G. JULYAN, W. C. SARGEAUNT, Crown Agents for the Colonies. Offices of the Crown Agents for the Colonies, Spring Gardens, London.

INDIA OFFICE.—Twenty-five appointments in the upper class of the Electric Telegraph Department in India will be open to competition during the present year. Full printed particulars of the conditions on which candidates will be admitted to the examination may be obtained upon application to the Under-Secretary of State for India, India Office, London, S.W. Ten junior appointments in the engineer establishment of the Public Works Department in India will also be open to public competition during the present year.

PRIZES.

SOCIETY OF ARTS PRIZE COMPETITION.—The works sent in for competition for the prizes offered by the Society of Arts are now open to the inspection of members and their friends. The number of works sent in for competition is sixty-two, beside six others sent for exhibition only. There are but three competitors for the prizes offered by the Worshipful Company of Plasterers.

GOOD IN ALL.

SMITING upon the anvil,
Plying the loom or plough,
Wiping the sweat of labour
Off from the weary brow—

Serving in shop or kitchen,
Ruling in court or hall;
Be they but true and honest,
Then there is good in all.

Each in his own vocation
Striving to play his part,
Each from the ways of evil
Keeping his hand and heart—

Then, though many misjudge them,
And many more miscall,
God, looking down from heaven,
Seeth the good in all. G. E. M.

CORRESPONDENCE.

**** We shall be happy to receive any information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* WORKING MAN, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

EXHIBITION AT BIRMINGHAM.

To the Editor of the WORKING MAN.

SIR,—As it is your intention in your new paper, to which I wish all the success it will deserve, to give a few articles on working men's exhibitions, I trust that a question of such import to working men as the following, will be well ventilated, viz.—Why is it that so many working men's exhibitions have hitherto failed? A friend, in answer to that question to-day, said, "Because of the mixture of classes." If that be a correct answer, if it really be a fact that the working classes and the upper middle class cannot work harmoniously together, why "there must be something rotten in the state of Denmark." I hope that your articles may point out this "something," in order that the defects may be remedied. Now, perhaps, of all the failures of this kind, none has been comparatively greater than the one held in our town lately. It must be borne in mind that a financial success does not constitute a positive success. The object of an Industrial Exhibition is to benefit working men, and from the moment an exhibition falls short of that object it is a failure. The committee of our late exhibition was composed of two classes—part working class and part the upper middle class; the Rector of Birmingham, the Rev. Dr. Miller, was chairman, and the committee numbered seventy-two individuals, eventually proving the truth of the old adage, that "too many cooks spoil the broth." Now the exhibitors complain that they have been deceived and impoverished by the committee of this exhibition, and they base their complaints chiefly on the following facts:—Firstly, that £1,000 having been guaranteed in prizes, they (the exhibitors) contributed articles with the understanding that that sum would be distributed, but although there was a surplus of about £3,000, only £110 was spent in prizes, the intrinsic value of which was about £20. Secondly, that through mismanagement, and through the managers breaking their own rules, numerous articles were broken, injured, or stolen, and that when claims for the value of such articles were made, no satisfactory reply could be obtained. Thirdly, that articles from manufacturers were introduced, and that, therefore, the work of skilled professionals was brought into antagonism with that of amateurs; the circumstances under which articles were elaborated never being considered at all. Fourthly, that though the committee have acted in such a niggardly manner to exhibitors, they are said to have been recklessly extravagant in other directions, and have not yet published a detailed balance sheet. I might go on with these complaints almost *ad infinitum*, but I am afraid your space will not allow it; suffice it to state that the exhibiters, rendered indignant by their grievances, and disgusted with the constant squabbles of the executive, formed a committee to protect their interests, but they sought redress in vain, being met with the reply, that they were "discontented grumblers." I ask you to insert this, having no other medium. The exhibiters' committee were about publishing a memorial volume, giving the history of the exhibition, but it has been most unfairly suppressed.

Respectfully yours,
JAMES GILLMAN.

Highgate, Birmingham,
January 3rd, 1866.

[*We publish the above letter because it seems to open up a serious question. We shall, however, be happy to afford every facility for an explanation of the statements contained therein.*]

NOTICE.—With No. 1 of the WORKING MAN is presented gratuitously

THE WORKSHOP ALMANACK FOR 1866,

Which should be delivered to every purchaser.

ADVERTISEMENTS for insertion in the WORKING MAN should be forwarded one week previous to the day of publication, and be prepaid in stamps, according to the following scale of charges:—Personal Advertisements for Situations, &c., 6d. per line; Working Men's Institutions, 9d. per line; General Advertisements, 1s. per line.

The WORKING MAN will be forwarded by the Publishers, post free, for Twelve Months, on receipt of 13s.

THE ORIGINAL

Chlorodyne, invented by
RICHARD FREEMAN, Pharmaceutist.
Consumption, Bronchitis, Coughs, Colds, Whooping-Cough, Asthma, Cholera, Dysentery, Diarrhœa, Spasms, Neuralgia, immediately relieved, and most cases cured, by FREEMAN'S ORIGINAL CHLORODYNE.
It is largely employed in hospital and private practice by the highest Members of the Medical Profession as a remedy of intrinsic value in the above diseases. In tropical climates it is used, par excellence, as the remedy in Cholera, Diarrhœa, and Dysentery.
The Right Hon. Earl Russell graciously transmitted to Mr. R. Freeman, the Inventor of Chlorodyne, the following extract of a despatch from Acting-Consul Webb, dated Manilla, September 17, 1864:—"The remedy most efficacious in its effects (in Epidemic Cholera) is found to be Chlorodyne, and with a small quantity given to me by Dr. Burke I have saved several lives."
Numerous Testimonials from the most eminent Members of the Medical Profession enclosed with each Bottle.
Manufactured by the Inventor, RICHARD FREEMAN, 70, Kennington Park Road, London, S.
Sold in Bottles, ½oz., 1s. 1½d.; and 1½oz., 2s. 9d. each, by all Chemists.
CAUTION.—Beware of Spurious and Deceptive Imitations. The genuine has engraved on the Government Stamp, outside each bottle,
"FREEMAN'S ORIGINAL CHLORODYNE."
Be not persuaded to buy any Substitute. [5

THE WORKSHOPS OF THE WORLD.

THE MANUFACTURE OF GLASS.

Glass and Glass-Blowing.

THE manufacture of glass in this country has of late years developed itself to an unprecedented extent, the trade bidding fair to become, at no very distant period, one of the principal industries of the kingdom. This result is undoubtedly attributable, in no small degree, to the recent abolition of the excise duties on glass, whereby the glass manufacturer was freed from the absurd and senseless restrictions which had hitherto prevented him from making or adopting any extensive improvements in his trade, besides deterring him from undertaking experiment, with a view to the discovery of such improvements. For many years the better and more perfect descriptions of glass were imported from abroad—the British manufacturer, restricted to the production of the inferior qualities, having no chance whatever in the leading home or foreign markets. In America, where the manufacture was free from excessive excise regulations, great improvements had been introduced, but the comparative high price and scarcity of labour prevented them from being followed up so fully or so successfully as they have been within the last few years. In England the manufacture of flint-glass was introduced as early as 1557, and, despite the manner in which it was taxed as a luxury, the number of manufacturers gradually increased, although the glass made by them was of such inferior quality that the supply of drinking-glasses continued to be obtained chiefly from abroad. The use of glass for windows was unknown in Europe until a comparatively late period, for even so late as 1567 glazed windows were a luxury known only to the wealthy; and there being no native glaziers, the work had to be done by foreign artisans, who came over expressly for the purpose. The frames in which the glass was placed were purposely made movable, so that they could be taken out and, if necessary, put away to preserve them from accident. The kind of glass thus used was of extremely inferior quality, and could only be made in small pieces. The colour was generally of a greenish yellow, such a thing as a pure, colourless window-glass being an article almost unknown. It was fitted into leaden frames, each pane being diamond-shaped, and containing only a few square inches. In 1673, some plate-glass was made at Lambeth, but the heavy duties imposed upon the article, together with the limited demand for it, caused its manufacture to be abandoned until nearly a century afterwards, when it was revived, with some measure of success, by a company who had subscribed capital for the erection of works upon a large scale at Ravenhead, near Prescot, in Lancashire. During the reign of William and Mary, the duties upon glass manufactured in this country were so heavy that they had to be speedily reduced, and subsequently abolished. In 1746, glass was again taxed, the duties being increased from time to time, until, in 1806, they became almost unbearable. The principal seats of the glass manufacture are in the north of England, Newcastle-upon-Tyne and Shields producing the largest quantities of the article; but glass-houses may be found in nearly every part of the kingdom. At present, such is the high degree of perfection to which British glass-making has been carried, that our manufacturers are enabled not only to produce specimens fully equal to those of foreign origin, but to compete successfully in the foreign markets. It is in the manufacture of plate-glass, however, that the largest amount of progress has been made. It is but a few years since that the production of a sheet of plate-glass a few feet square was recorded as something wonderful; now it is not at all uncommon to find windows of the largest size consisting of a single pane. Nor is this all, for the strength, clearness, and crystal-like purity of modern plate-glass appear almost marvellous when contrasted with the thin, imperfect, and costly article which was formerly produced by our makers. In Scotland the manufacture is carried on upon a large scale at Glasgow and one or two other places. In Ireland there are glass-works at Dublin, Cork, Belfast, and elsewhere. In our illustration we have given a view of the interior of a glass-house. At a future opportunity we intend furnishing a description of the various processes connected with the manufacture.

History of the Working Men's College,

45, GREAT ORMOND STREET, QUEEN'S SQUARE, LONDON.

BY WILLIAM ROSSITER, SENIOR FELLOW OF THE COLLEGE.

II.—THE TEACHING OF THE COLLEGE.

THE College opened on Tuesday, October 31st, 1854. The prospectus of the first term contained an address to London working men, from which the following is an extract:—

The working men of England are trying, from various motives and in various ways, to educate themselves. Some of them hope that their class may obtain greater influence in the Legislature. They desire that it should qualify itself for that position by the study of laws and of history. Some of them think that there are many maxims of morality current among us which tend to divide and to degrade them. They wish to find out the true principle which binds men together, and shows them what objects they are to live for. Some are impressed strongly with the mischiefs that come to them from their ignorance of the causes which produce disease, and of the best means of securing health. Some wish to understand better the machinery with which they are working. Some feel what a blessing it would be to them if they could use their voices in singing, and their hands in drawing. Some are puzzled with a number of doubts about the world within them and without them, which they dare not stifle, and through which they long to see their way.

Some of us who belong to professions—as lawyers, physicians, ministers of the Gospel, artists, schoolmasters—have thought that we might fulfil our own duties far better, and understand better how they bear upon each other, if we could come into closer intercourse with the working men—if we could bring them into a college with us—if we could spend some of our evenings in helping them to set their thoughts in order on the subjects in which they are most interested, and to gain information on points about which they feel ignorant.

The name College is an old and venerable one. It implies a society for fellow-work—a society of which teachers and learners are equally members—a society in which they meet, not as belonging to a class or a caste, but as having a common life which God has given them, and which he will cultivate in them.

The following list of teachers and studies for the first term of the College, will best show how the College actually began its work with the students whom it called together:—

WORKING MEN'S COLLEGE,

31, RED LION SQUARE.

Principal:

Rev. F. D. MAURICE, M.A., Chaplain of Lincoln's Inn.

Council of Teachers:

Rev. J. S. BREWER, M.A., Queen's College, Oxford.
Rev. J. LL. DAVIES, M.A, Fellow of Trinity College, Cambridge.
M. GRANT DUFF, Esq., M.A., Balliol College, Oxford.
F. J. FURNIVALL, Esq., M.A., Trinity Hall, Cambridge.
THOS. HUGHES, Esq., B.A., Oriel College, Oxford.
R. B. LITCHFIELD, Esq., B.A., Trinity College, Cambridge.
C. B. LOCOCK, Esq., M.A., Trinity College, Cambridge.
J. M. LUDLOW, Esq., Lincoln's Inn.
J. F. M'LENNAN, Esq., Trinity College, Cambridge.
C. B. MANSFIELD, Esq., M.A., Clare Hall, Cambridge.
E. VANSITTART NEALE, Esq., M.A., Oriel College, Oxford.
C. H. PEARSON, Esq., M.A., Fellow of Oriel College, Oxford.
F. C. PENROSE, Esq., M.A., Magdalen College, Cambridge.
JOHN RUSKIN, Esq., M.A., Christ Church, Oxford.
F. STEPHEN, Esq., M.A., Trinity College, Cambridge.
C. R. WALSH, Esq., M.R.C.S.
J. WESTLAKE, Esq., M.A., Fellow of Trinity College, Cambridge.

The following is the arrangement of studies for the first term, November to Christmas, 1854:

TIME P.M.		SUBJECT.	TEACHER.
Sun.	8.30	The Gospel of St. John	The PRINCIPAL.
Mon.	8	Public Health	Mr. WALSH and Mr. HUGHES.
,,	9	Geometry	Mr. HOSE.
,,	9	English Grammar ...	Mr. FURNIVALL.
Tues.	8	Law of Partnership ...	Mr. LUDLOW.
,,	9	Political Terms Illustrated by English Literature	The PRINCIPAL.
Wed.	8	Nstural Philosophy and Astronomy ...	Mr. LOCOCK.
,,	9	Machinery	Mr. M'LENNAN.
Thurs.	7	Drawing	Mr. RUSKIN.
,,	8	Public Health	Mr. HUGHES and Mr. WALSH.
,,	9	English Grammar ...	Mr. FURNIVALL.
,,	8	Arithmetic and Algebra	Mr. WESTLAKE.
Fri.	8	The Geography of England as connected with its History ...	Mr. BREWER.
,,	9	The Reign of King John, Illustrated by Shakespeare's Plays	The PRINCIPAL.
Sat.	8	Vocal Music	

This list of classes will show very clearly what kind of education it has been thought good to offer the working men of London; and the character of this education is eminently *practical*—not practical as merely telling men what they already know, or as amusing them with "popular" descriptions of "common things," but practical in that it takes hold of the very commonest things that surround every Englishman; things which he sees, touches, talks of, every day and every hour; striving by means of these to lead him to observe the law and order that govern him, them, and the whole world.

Thus, we all use words, make them into sentances—it may be very ungrammatical ones, but we use, rightly or wrongly, our mother-tongue. It is from this fact that our college education in language starts. Our teachers take the words we use in our daily talk, tell us what they mean, tell us of their history, whether they are native Saxon words, or have come to us from another people, Danes, Normans, or French. Each word is made to tell its story of people long passed away, taking us back to times of Stuarts, Tudors, Plantagenets; or to the earlier days when Saxons and Normans strove for conquest; or to the still earlier times when both Saxons and Normans were as yet strangers in the land.

In this way the names of counties, of towns, of the days of the week, of the different ranks in society, of the articles of our daily food, all, in the teaching of our College, tell us many a tale, making us understand, far more than any formal History of England could, what kinds of people have lived in this land before us. And the more common the word is, the more likely to be used without thought, the more, generally, it has to tell us. When we have thus learnt to regard words as more than mere sounds, as having in them a definite life and meaning, we are led to discover for ourselves the laws which govern the arrangement of them into sentences; that, having first learnt what meanings words have, we may be able to use them rightly to express our own meaning.

The English classes have been from the very first most successful. So also have been the classes for teaching French and German. In the former (and the latter is fast approaching the same stage) the students have learnt to read French authors with pleasure, and to talk in French with ease.

The ancient languages, Latin and Greek, are also taught; but working men have seldom time to do much more than obtain a thorough knowledge of the grammar of one or both of these. This grammatical knowledge, however, is of the very greatest use, both for mental training and as a help in acquiring a really good knowledge of English. It is hard, indeed, to learn our own language well without a knowledge of the grammar of at least one other; and the Latin and Greek grammars are probably more useful for this purpose than the grammars of modern languages.

Our highest attainment in Greek has been to read the New Testament in its original language; in Latin to read Cæsar, Virgil, or Horace with pleasure; but in French a much more complete mastery of the language has been attained by the men of the French Literature class; and the more recently founded German class is making steady progress towards the same success.

Just as our College teaches us languages because we speak, so it also teaches us arithmetic, algebra, and geometry, because we count and measure; and therefore want to understand the laws of number and space. Our mathematical students have at various times extended their studies beyond these elementary subjects into the regions of trigonometry and mechanics.

The third great division of education—that of physical science—is one especially interesting to working men, and one *about* which they have many ideas, frequently very erroneous. Our College proposing to teach men through the facts of their every-day life, would naturally teach the facts and laws of the *things* around them. The physical science teaching of the College began with a class on Public Health, and has since extended, more or less, to most of the physical sciences. Geology, botany, physiology, chemistry, have all been taught, and the students in every class have been encouraged to study *things*, and not merely names. The geological students have furnished the College with a most valuable collection of fossils and minerals; while the botanical students have collected and arranged a sufficient number of dried specimens to form a very fair nucleus of an Herbarium.

But besides the great divisions of language, mathematics, and physical science, there are other studies even more interesting to men taking a daily share in the world's actual work. Men are not as schoolboys, equally willing (or unwilling) to learn whatever is put before them. A journeyman carpenter, or mason, or a bricklayer's labourer, who can neither read nor write, nor even count correctly up to a hundred, is a very different being from the sharpest first-class schoolboy, who may be thoroughly grounded in the "three R's," besides having a smattering of Latin and French, and a knowledge of air-pumps and galvanic batteries.

The boy learns what he is told because he is told, and having learnt it, goes off to forget it in the playground; but the man, be he never so ignorant and stolid, *does* think about the things he sees and hears of, and is puzzled by a hundred thoughts as to why things are what they are, and why people do what they do. The more ignorant he is, the more these things will puzzle him; and when he comes to our College, he will probably sit down in our adult school to spell little words, and form letters on a slate, but not as a boy would do the same work.

He will talk of all kinds of things with the men around him; will enunciate political, moral, and social theories with as much confidence and positiveness as any M.P. or philanthropist. Talk to him about reading, or the rule of three, and he listens like a child; but in matters political or social, the chances are that you feel yourself a pupil rather than the teacher.

The recognition of this fact—that working men do think, and think with interest—about things social and things political, has governed the teaching of theology, politics, and history in our College.

Because we are Englishmen, and because other Englishmen have lived and worked before our time, building up by their lives and acts the English society of the present day, therefore our College teaches us history and politics, that we may know what an Englishman really is and should be. It teaches us history, not as a string of amusing facts and pretty stories, but as telling us about facts with which we have to do, and which have to do with us; which explain to us why English society, political and social, is what it is; how it might have been otherwise: better if our forefathers had known how to have made it better; worse, far worse, if they had not done much and suffered much to preserve it to us as good as it is; how it is incumbent on us to do much, and, if needful, suffer much, to keep it from becoming worse—to try and make it better.

Just as our College teaches us history and politics because we are members of a nation, so it teaches us theology because we are members of Christ's kingdom, because we have thoughts about our spiritual as well as about our national life. As English society and our position in it can only be explained by the teaching of history and politics, so Christ's kingdom and our place in it can only be made known to us by the teaching of theology.

Our College, therefore, in all its teaching takes for its starting-point the actual thoughts and experiences of the English workman. It recognises him as one having a place in English society and Christ's kingdom, and strives to make clear to him what that place is. It does not talk to him about things that are merely pretty or amusing, but it talks with him about things which all men think about, and all men strive, more or less, to understand.

To use the words of our Principal:—

What we want is, not to put things into our pupils' minds, so much as to set in order what we find there, to untie knots, to disentangle complicated threads. The starting-point of our teaching must be the topic in which we find that our pupils are taking the most direct interest, whatever that may be. It cannot be insignificant if it is stirring the hearts of any number of people, if it is deeply stirring the hearts of even the one or two we are conversing with. If they are attaching an ex-

travagant consequence to some trivial point, we shall not make them think less of it by treating them or it with scorn. We can only dispossess them of their exaggeration by leading them from the paltry subject-matter to the principle which lies beneath it, and which really gives them their interest in it. When they have come into the daylight of a principle, they will perceive the relative magnitude of different objects which were distorted by the twilight and the morning mist.

While our College thus teaches us language, mathematics, and physical science, to enable us to understand the things around us, it has also taught us drawing and singing, not for use, but for ornament, not as businesses, but as accomplishments; but it has also taught us them thoroughly, not as mere pastime; and so our drawing and singing classes have become two of the glories of our College.

The great thing our universities of Oxford and Cambridge do is to turn out, not mere bookworms or pedants, but accomplished English gentlemen. Our College, believing that manual workers are not only Englishmen, but may be also gentlemen, teaches drawing and singing, as means of educating not only our intellects but also our affections.

To quote once more from our Principal:—

The great problem of all, then, is how to make men know that they are persons, and therefore that freedom and order are their necessary and rightful inheritance. There may be various ways of solving this problem. One of them may be by teaching household economy; one of them may be by teaching what many call an accomplishment or refinement. I do not care what influence you bring to bear upon the man, provided it does its work, provided it rouses him to be a man.

Apprenticeship: its Rights and its Duties.

IN directing our attention to the position and wants of all classes of working men, it is our design to pay due regard to the requirements of the great body of Apprentices in this country. During many years' acquaintance with all ranks of the working classes, we have had frequent opportunity of observing the unsatisfactory relation in which the apprentice often stands to his employer, and the want, on both sides, of clear and just views as to what apprenticeship really is, and the duties it involves on either hand. It is our object, in the present paper, to explain briefly the origin and purpose of apprenticeship—what is due to the apprentice and to the master—with the provisions established by law to meet the difficulties from time to time arising between them.

The very word *apprentice* is itself an indication that the custom now known as apprenticing took its rise at an early period of our history. It comes from the French word *apprendre*, to learn, and was adopted at a time when Norman-French was the prevailing language among the higher classes of our people. In feudal times it was found necessary by persons engaged in trade to associate together for the protection of their mutual interests, for the maintenance of their privileges, and for the security of independence and freedom in their transactions. In this way combinations or companies of citizens were formed, and rapidly acquired great influence and consideration. The next step was to secure that no persons but those duly qualified should be admitted to practise any particular trade; and with this object it was insisted that, before a man could exercise a calling, he should have been apprenticed, or *taken to learn*, by some one already a member of that trade fraternity.

This was the origin of apprenticeship, which is supposed to have sprung up in the twelfth century, and in time became an established custom throughout Europe.

It would be highly interesting to trace the history of apprenticeship and apprentices, as a body, in England; but we can only briefly touch on this branch of the subject. So prevalent had the practice of apprenticing boys become about the year 1400, that complaints were made that sufficient labourers could not be found to follow the pursuits of husbandry. It was therefore enacted, by a statute passed in the reign of Henry IV., that no person who had not land or rent to the value of twenty shillings per year—a much larger sum in those days than at the present time—should be allowed to bind his son or daughter apprentice. This statute was afterwards repealed, so far as regarded London and one or two other important towns; but the estimation in which apprenticeship was held, in the metropolis especially, at this time, and down to a far later date, may be gathered from an old writer, who says:—"From all shires and counties of the kingdom of England and dominion of Wales, the sonns of knights, esquiers, gentlemen, ministers, yeomen, and tradesmen, come up from their particular places of nativity, and are bound to be prentices in London."

The term of apprenticeship is supposed to have varied in different trades and different parts of the country. It was, however, settled and made uniform by an Act passed in the fifth year of Elizabeth's reign, which established seven years as the period in all trades throughout the kingdom, and persons who had not served this apprenticeship were expressly excluded from entering any particular calling. Down to the beginning of the present century this Act remained in force; but it was then felt to be far too exclusive in its provisions for the advancing spirit of the times, and so much of it as enforced apprenticeship as a means of entering a trade was repealed by a statute passed in the reign of George III. At the same time a reservation was made in favour of London and other corporate towns, which were allowed to retain, at will, their established customs.

Apprenticeship, therefore, is no longer a necessity, *by law*, to any one who would work at a handicraft. Practically, however, it is still insisted on in many trades, which are either wholly or partially closed to persons who have not duly served their time as apprentices. And, although no longer enforced, it is still recognised by the law, which provides for the rights of both master and apprentice, and the settlement of disputes between them.

The indenture,* or deed of apprenticeship, is a contract between the master or tradesman on the one hand, and the apprentice on the other, the former undertaking to teach the youth his trade, in consideration for which instruction the latter agrees to serve him for a certain time. In many cases the youth, or his friends for him, pay a premium to the master whose trade he is to learn; and in the majority of instances the master undertakes, by clauses in the indenture, to provide his apprentice with food and necessary clothing, or the means of procuring them, during the whole term of the engagement. The advantage arising to both parties out of this contract is, or ought to be, mutual. To the apprentice the most obvious benefits are the following:—

1. He is enabled to become thoroughly proficient in a trade or handicraft, by the exercise of which, with industry and skill, he may at all times obtain the means of livelihood. It is highly probable that he may even go beyond this, and in time acquire a competence in the trade so learnt. But in all cases it provides the means of securing the immediate necessaries of life, and a position of honourable independence before the world. For the man who has been taught a trade, and has it, in common phrase, at his fingers' ends, can scarcely be placed in a position of permanent want or distress, unless unforeseen affliction paralyse his energies.

2. Another advantage which apprenticeship confers, is the fact that by its means a man is enabled to go forth into the world, stamped and guaranteed, as it were, as a proficient in his business. Whatever may be said as to apprenticeship not being actually necessary in any trade, no one would contend that the man who has spent many years in learning it is not in a better position to practise it, with advantage both to himself and his employer, than he who has received no such continued training. All things being equal—natural aptitude, industry, &c.—he must, on the contrary, be a superior workman, and would therefore obtain employment where the other would fail. Moreover, in the majority of trades, and in our large towns generally, the apprenticeship system still prevails, and none but workmen so qualified can obtain admission to practise their calling. What "taking a degree" is in the professions, apprenticeship is in the trades. What the mint mark is to the coin, apprenticeship is to the workman. The metal may be, in one sense, quite as valuable without the mark as with it; but the mark enables it to obtain general currency.

It is the part of the master to secure advantages to the apprentice, by properly instructing him in his business, by providing for his necessary wants (in the case of in-door apprenticeship), and by exercising a judicious and kindly interest and supervision over his general conduct, so far as it properly falls under the master's eye. But these duties on the part of the master are accompanied by corresponding duties in return. The apprentice has to fulfil *his* part of the contract. In the first place, he is essentially *one who is to learn*, and, therefore, a teachable and tractable disposition is the first requisite on his part. In the next, he stands in the relation of inferior to superior, in respect equally of age, experience, and responsibility in the trade; and he has, therefore, to bow to the master's authority in all matters within scope of the contract. Kindliness and forbearance are to be exercised on the one side; civility and deference on the other. Again, it is the duty of the apprentice to study to promote, as far as possible, his master's trade interest, and to reveal none of his secrets in the "art and mystery" he may practise. And finally, the apprentice is especially bound to fulfil the whole term of his engagement. After he has been taught the trade—or, at least, has learnt so much of it as to make his labour remunerative—he is to continue with the master, and allow *him* to reap the benefit of his services for awhile, and thus repay him for the great disadvantage under which he has laboured in the early years of the engagement. To leave him as soon as the work began to make return would be an unfair breach of contract; moreover, it would disqualify the apprentice himself from reaping the full fruits of the engagement, which he can only enjoy on completion of the entire term. Too often it is the case that the apprentice who, towards the close of his time, can work nearly or quite as well as the journeymen around him, begins to murmur or feel discontented at the conditions under which he labours. As well might the master have desired to repudiate the contract in the first or second year. Both parties have an advantage to reap, at the expense of a corresponding disadvantage, at one period or other of the term. The contract is a perfectly equitable and just one; but, on the whole, the weight of benefit is on the side of the apprentice, who derives a *permanent* advantage in the proficiency he acquires in his trade.

We must defer for another paper an outline of the law affecting master and apprentice in their mutual relations, which will give us an opportunity of touching upon some points of dissatisfaction that frequently arise between them.

(To be continued.)

* So called because two copies of the writing were usually made on one sheet of parchment, and then separated by an irregular or *indented* cut, each of the parties to the contract taking a copy.

THE HOMES OF THE POOR.

(Selected.)

OH! the homes we give the poor!
In the alleys damp and grim,
Where all noisome vapours swim,
In the cellar-caves that drink
Poison from the sewer and sink,
Are the homes we give the poor.

See the homes we give the poor:
Piled to weary, dangerous heights,
Toward heaven's cold and pitiless lights,
Chilled above by wind and snow,
While the fire-fiend lurks below—
See the homes we give the poor.

Are they *homes* we give the poor?
Danger sits by every gate,
Pain and misery round them wait,
Ghostly tenants put we in,
Death, disease, and shame and sin—
Homes they are not for the poor.

Have we no homes for the poor?
Hold we earth so cramped and bound,
Place for these cannot be found?
Do *our* homes so wide expand
That they cover all the land?
Leave we no homes for the poor?

Near us ever are the poor:
They are nearer than we think;
We but stand upon the brink
Whence we push them; and their fall
Shakes the mansion and the hall:
We are very near the poor.

Ask we how to bless the poor?
Build them houses not unmeet
To be trod by human feet—
Give them homes; and blessings thus
Shall run swift from them to us—
From the homes we give the poor.

*An Address.**

TO THE WORKING MEN OF THE UNITED KINGDOM.

The question may be asked, "Is there not a danger of men losing earnestness in proportion as they acquire a higher degree of culture?" Yes. Dangers attend everything we do. There is no man so terribly in earnest as a fanatic with one idea—"seeing right and truth in nothing else." Nothing like bigotry and ignorance to ensure unyielding tenacity of purpose, and indomitable energy, *except* the highest and widest knowledge, combined with the holiest devotedness to duty and to God. We are not to refuse culture and information lest, in losing one-sided bigoted earnestness, we fail to win that far higher earnestness which comes from a nobler source. Still, the danger is there, no doubt. Philosophers, poets, sages, artists, are seldom men of action. As people get knowledge and worldly wisdom, they may easily be tempted to care for nothing particularly, except their own comfort. Happily, there is no fear that English working men will fall into this state at present through gaining greater knowledge, for it is the *morally* best among them that will seek most faithfully to improve themselves *intellectually*.

Again, observe how all this mental improvement and knowledge will help to prevent those "roots of bitterness" already referred to springing up between shopmates and fellow-workers—not merely by helping to prevent that exaggeration which distorts motives, and magnifies offences, but by giving pleasant and interesting subjects of thought, which will divert the mind from morbidly dwelling upon one disagreeable topic, whatever it may be. Very much of the unkindness of the world comes from its unhappiness.

This brings us to the third form of remedy we hope to offer for the troubles of working men, which consists in promoting their rational *recreation*. We want to help you, working men of England, as far as lies in our power, to share more fully in the rich fund of amusement and refining, elevating enjoyment to be found in the literature, poetry, history, art, and science of this and other countries. A great deal of the vice of the world is only the perversion of right instincts. We were meant for play as well as for work—*meant* to have excitement and diversion. "What *shall* I do to make you good?" said a sorely-perplexed mother to her naughty little boy. "'Mooze me," answered the poor little fellow. Of course. The Great Parent of all has formed us to need, and to be the better for, amusement. "Amuse me" is the universal cry, consciously or blindly, of the poor sinning soul to its leaders and guides—of the soul that longs to be kept from evil, but finds no healthy, innocent joys. In the pages of this Journal, and especially in my own department of it, we earnestly hope to amuse as well as inform you who do the hard, heavy, mechanical, often monotonous, work of life—who do it not for yourselves only, but for us, also, who sit apart and are set to work in return for you. We would fain open up to you here a fair little pleasure-garden, into which you may turn sometimes at the close of a weary day or week of toil; where you may forget the cares and irritations of life, where you may enjoy some happy excitement that will leave no sting behind, as you dwell among the scenes of other days, the stirring deeds of brave and earnest men, the lovely and graceful fancies of the artist and the poet. In these columns you will be invited now and then to turn aside from the turmoil and strife of the world, and find peaceful enjoyment; to forget for awhile more important responsibilities, and so be enabled to return to the duties of daily life refreshed and stronger for the change. Many gracious and gentle influences, much stirring and heart-gladdening excitement, await those who will accept it, in the glorious literature of this old England of ours. We aim only at presenting a *glimpse* at its untold riches; preparing, inviting, guiding our brethren to enter into their inherited possessions.

But while we believe that all these and many other good things may be done for you, to some extent, by the humble instrumentality of this Journal and our own special department, and while, of course, there are many other evils and remedies the discussion of which must be reserved for future occasions, let me pray you to remember that I have a far more urgent appeal to make to you here than simply that you should read this Journal. I appear in its columns as the advocate of certain societies—of Social Clubs, formed to secure to you, far more efficiently and permanently than any written or spoken words can do, the blessings so many of us desire to see you possess. Those whom I represent ask you *to form and maintain these clubs* as the abiding strongholds for securing to yourselves the various advantages of which I have now spoken. Our words, here or elsewhere—ay, and our labours, too—on your behalf, weak and imperfect as both are, must pass away, and their influence, little enough at any time, will soon no longer be felt; but if you entrench yourselves, as it were, in Working Men's Clubs and Institutes, they will be to you at once a fortress and a palace, enduring, beautiful, and secure. In the various means and opportunities they offer—in the chat-room and library, the class-room, concert, and lecture hall—in all the agencies you can bring into operation, whether by the help of the best and wisest of your own class, or by that of more highly cultivated friends, who would gladly enrich you, if you desire it, with their own learning, their literary, artistic, or scientific acquisitions, you will find ample and increasing means of enjoyment and improvement, such as the world has seldom yet seen offered to its noble army of hand-workers.

In former ages men lived and died as savages. They have risen slowly, step by step, to the dignity and happiness of civilised men. Ages of struggle and conflict have been preparing for you individually—for every worker among you—preparing to help you to live higher and happier lives than your forefathers lived, whether savage or serf. Brave, good men have done their part. Will you now do yours? Men of genius lay their brightest offerings at your feet. Will you accept them? For thousands of years the glorious work has been going on, accumulating treasures of wisdom, beauty, wonder. At last the whole of the rich and mighty stream of blessings comes down to us—to *you*—*you* who are now reading this paper, and to him, your mate, who might be—truly great opportunities for us all. How are you inclined to welcome them? Will you join with us to help all to use them worthily? or will any of you say, "Leave us to the old ways; the pipe and the pot are all we require?"

We knew, and *you* know, there will be some difference among you twenty years hence—socially, politically, morally—(as there is indeed *now*), according to the answer given to all these questions.

It is impossible to close an address of this kind, without thinking of those dismal days of sorrow and strife which many of you remember in 1839-43, and during which I first became acquainted with you. But I trust those days have passed away for ever. They taught us many valuable lessons, and no doubt the times of "uprooting" and strife, of disappointment and hindrance in all ages, have been permitted for wisest and kindest purposes. But the brighter, happier time of building Palaces and planting Pleasure-gardens, of entering more fully into the rights and duties of Citizenship, of forming noble Industrial Exhibitions, and thriving Co-operative Stores, and permanent Museums of art and science, and brotherly Working Men's Clubs, is always intended to succeed the period of disorganisation and strife.

It has been said of old, "Except the Lord build the house, they labour in vain that build it." In His hands we may leave the great result; and knowing how thoroughly we are all in earnest, you will not think I am uttering cant if I add that we may leave it there with confident hope, remembering another great truth foreseen in glorious vision by the prophet, and continually fulfilled in every age concerning the children of men, viz.:—

> Like as I have watched over them to pluck up, and to break down, and to throw down, and to destroy, and afflict, so will I watch over them to build and to plant, saith the Lord.

Therefore I say that we *may* trust Him for the issue, never doubting that if we all do our part faithfully, working and praying, we shall all receive, in continually greater abundance, those unspeakable advantages and blessings—social, political, moral, and intellectual—to which the words, not of Mr. Gladstone only, but of prophet and statesman, poet and sage—the aspirations of the gifted and the good, in all ages—so emphatically point.

I remain, an old friend to some of you, not unknown to others, a brother to all,

Yours in faith and hope,

Henry Solly.

* Concluded from page 25.

Workmen's Home at Guise.

On approaching the little town of Guise, near Saint Quentin, in France, the stranger's attention is attracted by the vast façades of two lofty buildings of a palatial appearance at the extremity of the principal street. They stand in the midst of lawns, groves, and gardens, about fifteen acres in extent, and occupy a peninsula formed by the Oise. The brick façades are highly decorated, having frontals in the centre and at the angles, cornices with dentils, pilasters, and projecting panels, all edged by lines of violet-coloured bricks upon a red ground. The entire edifice is graceful and harmonious, inspires a feeling of grandeur, and surpasses many a royal palace. Yet it is the property neither of a nobleman nor a merchant-prince, but the home of workmen in an iron foundry and their families. It is called the Familistery; and that bridge across the Oise, where you see such constant passing to and fro, connects it with the employer's house, warehouses, and works. His name is M. Godin, and he is one of those rich men whose ambition is to make those around him as comfortable and happy as himself. He has built this magnificent Workmen's Home, that those whom he employs may enjoy every comfort suited to their condition, and that the absence of all that is humiliating, unclean, unwholesome, and unsightly, may raise them morally and materially in the scale of society. His benevolent designs have been rewarded; his costly experiment has stood the test of four years, and proved eminently successful. The capital which he invested in it yields him 6 per cent., and by his thoughtful management 700 poor workmen—blacksmiths, carpenters, enamellers—with their wives and families, are better lodged, clothed, and fed, and have more innocent enjoyments within their reach, than elsewhere fall to the lot of the ordinary tradesman. The establishment is a perfect model, the admiration of all who visit it, the surprise and delight of all who read of it. Having realised a favourite vision of social science, we earnestly trust that it will be widely imitated; and though we fear that its success will not be as signal here as in France, because drunkenness and brawling prevail among us to a greater extent than they do there, because the English working classes are less provident than the French, and submit less easily to discipline, yet we hope, in spite of these drawbacks, to see Workmen's Homes on a similar scale, and with a like system, rising speedily in various parts of the country.

It would require a pamphlet rather than a short article to give a detailed account of the residence in question at Guise. We can but advert to some of its most striking points. To say that it consists of independent apartments, connected in one spacious and handsome building, where the lodgers have ample space, and are secure from bad drainage, noxious cesspools, imperfect ventilation, roofs out of repair, smoky chimneys, high rents and heavy rates, would fall very far short of a fair description. It exhibits in all its minor arrangements the minutest attention to the wants and comforts of the inmates, whether children or adults. Notwithstanding the neighbouring river, the soil is kept dry, and under the building and court are a series of vaults, which contain the cellars. Each lodging has a cellar and granary or loft belonging to it. Wide bays or openings in the basement walls give free access to light and air; the skylight which covers the court has numerous openings, and the court itself is watered in the hot season. In sultry weather the entire enclosure is comparatively cool and pleasant; on each landing of the house there are fountains; and the reservoirs at the top of the buildings are supplied by a small steam-engine. Cleanliness prevails in every part. Some of the women in the Familistery are engaged to wash and sweep

and the average daily consumption of water is five gallons for each individual in the Home—a fact which sufficiently proves how much private cleanliness is attended to.

A thoughtful provision for the children deserves particular notice. The immense skylight alluded to above protects them in their play from rain and snow. Here they try their first steps and their first gymnastics; here they enjoy their healthful sports; here, on grand occasions, school prizes are distributed; and here, on the ground of beaten and polished cement, the merry dance goes round to the music of eighty amateur workmen, forming the Philharmonic Society of the Familistery. A balcony, reached by broad staircases at the corner of the buildings, runs along the façades, and from this, or from her window, the mother at her work can watch her child at play with his school-fellows in the spacious court below. There no dangers menace him, and no restraint is put upon his buoyant spirits. Nor need his mother waste her time in going about the town to make bargains. On the ground-floor are retail shops, directed by a manager. Butcher's meat, bacon, rabbits, vegetables, and every article of daily food, wine, cider, fuel, cottons, thread, and all that the housewife usually needs, is there supplied at cost price, plus a small per-centage to cover expenses. The wives and daughters find employment at the several counters, and each one, in so large a community, can easily obtain remunerative labour. The unmarried workmen get all they require at a restaurant belonging to the establishment, and the meals they take there cost them from 7½d. to 10d. a day. In addition to these comforts, a casino is provided for the workmen's instruction and recreation. They can visit it occasionally, or subscribe by the month. There is a reading-room supplied with newspapers, a billiard-room, and a refreshment-room; and while they chat, or play some innocent game, they are often regaled with music by the Philharmonic Society in an adjoining room. The leader of the band is paid by M. Godin. The general rehearsals take place weekly, and M. Godin's son is one of the members.

Much as we are obliged to omit, we must not forget to say that a medical man visits the establishment daily. His services are paid by a Mutual Benefit Society, formed by the male inmates, which also pays two francs a day to any workman disabled by sickness. The rent of the unfurnished apartment of from one to five rooms is at the rate of 3s. 9d. a month for each room; and the cost of a furnished room for a single workman, with linen and also attendance, is from 6s. 8d. to 8s. 4d. a month. The apartments, with five rooms and a kitchen, and numerous closets and cupboards, the rents of which, free of all taxes and repairs, are £18 a year, would be cheap at £120 in Paris on a third floor.

But these, you will say, are all material advantages. What does M. Godin do for the mind? What provision is made for the children's education? Do they learn only to play and to work, to get money and to spend it? You shall hear. M. Godin's thought for the children is almost without parallel. There is a nursery in the Home called the Pouponnat, for infants from their birth till about two years old. It is provided with elegant iron cradles, supported on two poles and furnished with curtains. These receive the babies while their mothers are at work, and kind nurses attend to them and supply all their wants by day or night. All in the Pouponnat is gratuitous—baby-linen, milk, food, medical care, and everything a tender mother would wish. After the nursery comes the Bambinat. Here the little things remain till the age of five or six, and henceforth their food and clothing is at their parents' expense. The system of education pursued is on a level with the latest improvements, and the very intelligent teacher, wife of one of the workmen, has her two children among the pupils. All the elements of knowledge are simplified, and lessons are disguised under the shape of amusements. The School follows the Bambinat, and is so conducted as to produce admirable results. Signor Pagliardini, himself an examiner, describes them as "wonderful." The boys and girls are taught together, though on different sides of the room, for it is part of M. Godin's plan to foster morality by the "constant, open, and unmysterious companionship" of young persons of both sexes from their cradle upwards. The parents pay nothing for their children's attendance, but are fined a penny for each day on which a child is absent. This is a wise regulation, and is, in fact, the only one which interferes with the workman's liberty. He is denied the right to let his boy or girl grow up idle and ignorant, but in all other respects his life, so far as the Home is concerned, is freedom itself. Punishments are there unknown, except it be the exclusion of the child who has done badly during the week from the private garden, which on Thursday afternoons is thrown open to all the good and diligent children, to their intense delight. It is charmingly laid out with flower-beds and fruit-trees of all kinds, of which they eat in the proper seasons. Another punishment consists in not being allowed to spend part of Sunday with "Mademoiselle Marie." This is a young lady of great ability and high education, a relative of M. Godin, who superintends the Pouponnat, the Bambinat, and the School. In her apartment the children find toys of every kind, and great is their joy when they are permitted to visit her. Their place in the class is determined by their proficiency during the week. We forgot to mention that the parents are not obliged to buy goods at the stores—it is quite optional; but if they do so, it must be for ready money, or they may give cheques to the amount of their daily wages. The manager, the schoolmaster—who is a young professor from Paris—Mademoiselle Marie, and the benevolent founder himself, are all engaged heart and soul in the work, and seem to enjoy to the utmost the luxury of doing good. M. Godin caused this motto to be inscribed on the foundation-stone of the Familistery—"*Dieu nous soit en aide. Hommes soyez-nous favorables;*" and we cannot doubt that he will continue to obtain from God and man that assistance and favour which he has so abundantly earned. To raise the moral character of his workmen and their families is the chief end he has in view, and to attain it he places the means of instruction within their reach, and surrounds them with every comfort.—*London Review.*

TOILET-STAND AND MIRROR.

TOILET-STAND AND MIRROR.

THE true combination of utility with ornament is happily illustrated in the design for a toilet-stand and mirror, which we this week present to our readers. The style of design is that known as the *Renaissance*, which, in French, signifies "*new* birth," and is used to distinguish the particular style of decoration revived by the painter Raphael during the pontificate of Pope Leo X. The great artist was led to direct his attention to this peculiar style, in consequence of the discoveries made by him of various ancient paintings, in some of the newly-exhumed portions of Rome. Adopting the general form of ornament found in these paintings, he grafted thereon a style peculiarly his own, thereby producing the kind of decoration to which the term Renaissance has been given. The design we have furnished, although in this style, is decidedly original, and deserves particular attention. It can be executed in wood or metal, or by a combination of both. The foot, or base of the stand, the group of Naiads and coral stems supporting the shell, as well as the shell itself, might be in metal, the frame of the glass being of wood. A very pretty effect would be obtained if the shell was a real specimen instead of an imitation. We would also suggest that the supports of the mirror should be of real or artificial coral. The height of the stand and glass would be from twenty-four to thirty inches, and in the base cameos might be judiciously introduced.

WHAT IS IN THE BEDROOM?—The importance of ventilating bedrooms is a fact which everybody is vitally interested in, and which few properly appreciate. If two persons are to occupy a bedroom during a night, let them step upon weighing scales as they retire, and then again in the morning, and they will find that their actual weight is at least a pound less in the morning. Frequently there will be a loss of two or more pounds, and the average loss throughout the year will be more than one pound; that is, during the night there is a loss of a pound of matter, which has gone off from their bodies, partly from the lungs, and partly through the pores of the skin. The escaped material is carbonic acid and decayed animal matter, or poisonous exhalations.

Diffusion of Co-operation.

GOETHE, who, like Shakespeare, said a thousand remarkable things, observed, that "for a man to know one thing well he needs also to know a thousand." It certainly is necessary to know many things to understand one practically. It may be that without the suggestive light of contrast, and the instruction which always comes by comparison, it is impossible to obtain a clear and distinct idea of any subject or object. Familiarity, strangely enough, does not teach; it blunts the perceptions, or it tones down characteristics, while newness of inspection sharpens the eye to observe them. However it may be, every man knows it is so. The traveller, when he comes home, has far sharper eyes than he took out with him. He sees a hundred things in his own land and native place that never struck him before. He knows better what to value, and has sense to own that many things require amendment which he thought well enough before. Since international exhibitions were held, and the middle class took to travelling to inspect them, aldermen and town-councillors have had much higher taste for improvement than heretofore. Means of comparison are means of wisdom. For this reason we will say something of Co-operation abroad, as it may quicken appreciation of it at home.

The Italians have a proverb, wonderful in its sagacity for that quick-witted people; it is this: "They who go slowly go far." Then Co-operation may be expected to go far, for it goes very slowly. And it has gone both slow and far. It has issued like the tortoise from its Laneashire home in England; it has traversed France; it has overrun Germany; it has crept under the frozen steppes of Russia; the bright-minded Bengalese is applying it; the seen-seeing and far-seeing American is turning over the idea; and our own emigrant countrymen in Australia are endeavouring to naturalise it there. Clearly, Co-operation is becoming what the *Times* used to call "an established fact." Like Liebig's new essence of beef, or a good chronometer, Co-operation is unaffected by change of climate. It remains fresh and wholesome, and goes well.

Professor Talandier published a translation of "Self-help—the History of Co-operation in Rochdale," in a Lyons newspaper, and enriched the translation by valuable notes of his own. M. Elie Reclus, the editor of *L'Association*, has told the moral of that history to the Parisians, in his "Fable of the Blind Man and the Lame Man," in his own "History of the Co-operative Associations of Workmen in Great Britain;" and Co-operative Associations have greatly multiplied in France in consequence. Deputy Schultz Delitsk has inspired Berlin, where, in the east quarter of the city (the Berlin Spitalfields district), the Berlin Shawl Weavers' Association is to be found. Though formed but four years ago by twelve members, they had increased, in March last, to 105, while their capital had multiplied thirtyfold. Herr Schulze not only makes the doctrine of self-help the constant text of his speeches before the working classes, he is continually occupied in showing them how to put the principle into practice. Madame Mario has explained, in *Il Dovere*, of Genoa, the characteristics of English Co-operation to the Italians; and societies of mutual succour, formed under the auspices of the great leader of Italian unity, have for some time been in operation throughout Piedmont. Association has been fervently advocated in Italy with a loftiness of aim unusual in industrial societies.

In Switzerland, we learn, on the authority of Professor Huber—the distinguished advocate of Co-operation in Germany—that there existed in the Alpine land thirty Co-operative Stores in 1863. Indeed, the learned professor of Wernigerode stated some time ago, in reply to Mr. Howitt, that the number of Co-operative Societies in Germany was about 1,000, with a working capital of £5,000,000, or 30,000,000 thalers. The Germans, it must be confessed, are as competent as any people in Europe to weigh a new industrial scheme in the balance, and determine whether or not it is wanting. Therefore, their general adoption of the co-operative principle in practice is proof that there is "something in it."

It fares badly with working bakers in most places. Their wages are not high, and their hours of labour are perilously continuous. Those who have found their way to Australia are followed by, or meet the same ill fortune there. In Sydney, however, they propose to confront it as it might be confronted at home—by a Co-operative Association. The resident gentlemen favour the proposal, and several distinguished clergymen lent their approval and support at the meeting held to form the "Sydney Baking Company." It is some time ago since this meeting was held. The Rochdale results were quoted by Mr. Parkes, the speaker who contributed the greatest information to the audience; and it was clearly felt that it was as much the interest of the inhabitants and consumers of bread in Sydney to have a Co-operative manufactory of it there, as it was that of the working bakers themselves. Co-operation ensures purity of food for the eater, as well as better wages for the journeyman preparer of it.

Mr. Commissioner Hill, the Recorder of Birmingham, whose services to the cause of social progress exceed any praise of ours, lately related an anecdote, which ought to show to the reader that the value of the co-operative principle was discerned long ago by a shrewd people, whose name, in connection with Co-operation, is seldom mentioned, unless by Mr. Urquhart, whose remarkable out-of-the-way knowledge is proverbial—we allude to the Greek merchants. Major Cartwright—whose name only very old politicians remember—once told Mr. M. D. Hill that, in his youth, he (Major Cartwright) served in the royal navy, when, among other parts of the world into which he cruised, he found his way into the Mediterranean Sea, at a time when England was at war with Turkey. Greece being formerly a part of Turkey, our cruisers had to give chase to Greek merchant vessels, but they rarely if ever made a capture. Major Cartwright, who had an inquiring mind in all latitudes, was curious to ascertain the cause of these clever Greek escapes; and he discovered that, after a wise Greek custom, every one of the crew, from the captain to the cabin boy, had a share in the vessel. In fine, they sailed and fought on co-operative principles. Our English cruisers, sharp as they were, could not catch a co-operative ship on competitive principles. An ordinary observer would declare at once that the fear of imprisonment, and probably death, would suffice to make men sharp and brave; and if such risks did not, nothing would. Nine persons out of every ten would say so; and yet it proved, that having a personal interest in the ship itself kept the watch sharper, the arms nimbler, and the dash and daring of the sailors higher in quality than the fear of the gaol or the bullet. Co-operation has faculties for war as well as peace, and moves men by motives stronger than the fear of death. The reader may be assured that Co-operation is a motive power in industry, like steam; and, like steam in Savary's days, it is only as yet seen issuing out of the kettle-spout. It has hardly been set to work. It will turn strange, undreamt-of engines one day.

FEMALE SCHOOL OF ART, QUEEN SQUARE, BLOOMSBURY.—This institution, which was established in 1843, in connection with the Science and Art Department of the Committee of Council on Education, affords instruction in geometrical drawing and perspective; elementary freehand drawing from the flat and from the round; shading from the flat and from the round; drawing from solid models; figure drawing from the flat, from the round, and from the life, including anatomical studies and drapery; wood engraving; painting in water colours, tempera, fresco, and oil, from examples of ornamental art, from nature, landscapes, animals, foliage, flowers, fruit, &c.; exercises in composition, and original designs for decoration. The teachers of the school hold full certificates from the Science and Art Department. Students have the privilege of copying specimens of plants and flowers from the Royal Gardens at Kew; the managers of the Royal Botanic and Zoological Societies also grant free admission to students in the advanced classes, to sketch in their gardens. Examinations for Art Certificates are held annually in March, and are open to all, whether taught in the school or not. Free studentships for one year, renewable on expiration, are granted to all who obtain the first certificate of the third grade. To enable competent and eligible students to have the benefit of a continued course of advanced instruction, they may compete for the Queen's scholarship of £20 per annum, tenable for one or two years, in accordance with the conditions on which the scholarship is granted. In addition to considerable alterations and improvements in the large and numerous class-rooms heretofore in use, a lofty sculpture gallery, 47 feet long by 26 feet wide, has recently been erected, and supplied with the best models, and other appliances for study, ample accommodation being thus provided for an increased number of students. At the present time there are about 90 students, and, with the recent additions, there is now accommodation for 150.

Men who have Risen from the Ranks.

III.—EBENEZER ELLIOTT.

AMONG the half-forgotten but memorable men who have sprung from the working classes, and attained honourable distinction, both for power acquired and service rendered to their own order, must be ranked the once familiar name of Ebenezer Elliott.

In the vicinity of fire and forges, at Masborough, near Rotherham, Yorkshire, the famous "Corn-Law Rhymer"—the name he won for himself by his songs—was born on March 17, 1781. His parents were poor, and the prospects of their son bettering his condition were not promising. In his youth he displayed no aptitude for knowledge. It was accidentally called into existence by a book—one of those wandering works common at the beginning of this century, that fell like seed, sometimes on stony ground, and anon on fruitful soil. It was Sowerby's "English Botany" that fell in young Elliott's way. It had coloured plates of flowers, and these he was tempted to copy, and then the true aptitude for acquiring knowledge discovered itself. He sought out the flowers themselves. He verified his learning in the field, and the flowers—as flowers have often done before with the true lover of Nature—inspired him with song, and Elliott became, as he modestly called himself, a "rhymer."

From Sowerby's "Botany," he turned to Thomson's "Seasons," which he now knew how to understand. Thomson's description of a thunder-storm Elliott endeavoured to imitate. It might be from paucity of books—it might be from choice—but he usefully concentrated his attention on two great masters of poetry—Milton and Shakespeare. Real occurrences, however, were the chief influences which formed his mind, and it was great proof of a wholesome nature, and strong native capacity, that he mastered the events of his time and made them the subjects of his songs.

Southey had the generosity to encourage him, notwithstanding that the rising Yorkshire poet had considerable bitterness of speech in his political advocacy. In those days social oppression was a much more serious thing than it now is. Working men had no organs of their own, and no advocates, as in these times. When Elliott wrote his epitaph on Cobbett, he began thus:—

> "Our friend when other friend was none;
> Our champion when we had but one."

Lines these of noble and discriminating gratitude, which tell the story of days happily gone for ever.

Southey, overlooking the minor and pardonable fault of acerbity in the provincial poet, discerned his genius, and by his criticism taught Elliott, who had the good sense to learn, how to attain force and chastity of style. Elliott, who had natural fire, bettered his instructions, and became a great artist in expression. His poems would well repay study by all young rhymers. Indeed, he was a good critic, reliable and instructive himself, when he wrote criticism to the public; but when he gave an opinion of a friend to a friend, his praise was so wanting in proportion as to be utterly worthless, and could never be trusted. This was dangerous to young men who hung upon his words; but his printed criticisms were full of instruction—he was over-faithful there. His personal merit lay in his resolute and persistent self-culture. He made it the business of his leisure to study sentence-making, and he perfected them like a work of art; and his pride was to finish and polish his songs until bright and keen as his native cutlery.

His public worth consisted in the use to which he put his gift of poesy. He did not write verse for pastime, but for the service of the poor. Against the Corn Laws he directed all his strength. His verse was a cry of rage and tenderness:—

> "Child, is thy father dead?
> Father is gone!
> Why did they tax his bread?
> God's will be done!
>
> "Mother has sold her bed;
> Better die than wed!
> Where shall she lay her head?
> Home she has none!"

He kept no terms with the supine or stupid.

To those who could not, or would not see in what bad government consisted, he answered—

"What is bad government, thou slave,
Whom robbers represent?
What is bad government, thou knave,
Who lov'st bad government?

"It is the deadly *will*, that takes
What labour ought to keep;
It is the deadly *power*, that makes
Bread dear and labour cheap."

But amidst all his noble ire, the love of flowers was inextinguishable in him. They fringed with brightness his fiercest and sombre verse. In his "Forest Worship" he commences—

"Within the sun-lit forest,
Our roof the bright blue sky,
Where fountains flow and wild flowers blow,
We lift our hearts on high.
Beneath the power of wicked men
Our country's strength is bowing;
But, thanks to God! they can't prevent
The lone wild flowers from blowing."

Elliott is plainly of opinion they would if they could. It is often said that Elliott's poetry, expended on political wrongs which have passed away, cannot itself be lasting. Were this true, it would yet be long-lived, for it might be translated round the world, to awaken indignation until all wrong has passed away. Many of the great Corn-Law repealers owed their early inspiration to Elliott's manly, fiery muse. His poems on other subjects were many, and of great merit. Sir Lytton Bulwer was one of the friends of Elliott, and induced Tait to pub ish an edition of all his poems, for which we believe the poet received £1,000. He became an iron-master; and, what is rare among poets, he was a good man of business. His very handwriting was something characteristic; it was almost matchless in largeness and gracefulness. He acquired a moderate competence. He built himself a house which commanded a view of those rivulets and woods he has made famous in his songs. He educated his son, who became a clergyman of the Church of England. A statue of him, executed by Neville Burnard, the Cornish sculptor, stands opposite the Post Office, Sheffield. James Montgomery, a neighbour and contemporary poet, has said of Elliott that "he might be compared with Byron in tremendous energy, with Crabbe in graphic description, and Coleridge in effusions of domestic tenderness, while in intense sympathy with the poor he excelled them all. He was the poet of the poor." And considering that he sprang from the poor, acquired his power by self-education, applied it as one having the authority of genius, and always on behalf of his order, to whom he taught lessons of independence and freedom, Ebenezer Elliott well earned an enduring remembrance among those who raised themselves from the ranks.

*Heat Considered as a Mode of Motion.**

UNDER this title Professor Tyndall has published a course of lectures delivered at the Royal Institution, exhibiting the facts and latest ideas respecting the agent that penetrates everywhere in Nature. A summary of the author's views may be read with advantage.

Two rival theories have divided opinion on the nature of heat—the *material theory*, and the *dynamic* or *mechanical theory*. Until quite recently, the *material theory* had partisans only, or if adversaries, only a very few eminent men. It admits that heat is a kind of matter—a subtile fluid filling the inter-atomic spaces of bodies. It defines heat as *a substance whose admission into our bodies causes the sensation of warmth, and its departure the sensation of cold.* It speaks of heat combining with bodies as of two ponderable substances combining with each other.

According to the views of those who professed this theory, the quantity of heat existing in the universe is as constant as the quantity of ordinary matter, and that all we can do by mechanical means is to etore up heat, or make it come out of its concealment to produce it in full day.

The *dynamical theory*—or, as it is sometimes called, the *mechanical theory*—of heat dispels the idea of materiality in its application to heat. Those who profess this theory believe that heat is not matter, but an accident or condition of matter; that is to say, a *movement of its ultimate particles.*

From the direct contemplation of some of the phenomena of heat, a profound mind is led almost instinctively to admit that heat is a kind of motion. Bacon sustained a theory of this kind, and Locke has expressed the same opinion with singular felicity. "Heat," he says, "is a very vivid agitation of the sensitive particles of an object, which produces in us the sensation which makes us say that the object is warm; so that what to our sensation is *heat*, is in the object only *motion.*"

"I conclude," says Sir Humphry Davy, in his first scientific memoir, "that heat, or the cause of repulsion, is not *matter*. The phenomena of repulsion do not depend for their existence upon a peculiar elastic fluid: in other terms, caloric does not exist."

Heat accomplishes what may be called an internal work. It performs a work in the interior of the body heated, by forcing its particles to take new positions. Heat, then, is a *molecular* movement, an oscillation of the ultimate particles.

Nothing is more interesting to the physicist than to bring out the points of contact and the relations more or less intimate between the divers agents of Nature. We know that they have a common fraternity, we know that they are mutually convertible into each other; but we know, also, but very little of the precise nature of this conversion. We have every reason to conclude that heat and electricity are each modes of motion. We know experimentally that with electricity we obtain heat, and that with heat we obtain electricity; but our notions are very obscure as to the precise nature of the change which this motion must undergo to appear under the form of electricity. In reality, we still know nothing about it. A remarkable connection exists between heat and electricity with respect to their propagation in bodies. A body which is a good conductor of heat is also a good conductor of electricity, as a bad conductor of heat is also a bad conductor of electricity. We can also say that the physical qualities which intervene in the transmission of heat, intervene in the same proportion in the transmission of electricity. This susceptibility common to the two forces indicates a most intimate relation, which future researches will doubtless make apparent. The origin of radiant heat is an oscillatory movement of the ultimate particles of matter; a movement which ether takes possession of and propagates by its own undulations. But in these undulations the particles of ether do not oscillate in the same manner as do the particles of air in the case of sound. The particles of air move before and behind, in the direction according to which the sound is propagated; the particles of ether move from right to left, perpendicularly to the line according to which the light is propagated. The undulations of the air are longitudinal; the undulations of ether are transversal. This is what has been deduced from the aggregate of optical phenomena.

Radiation, strictly defined, is the *communication of the motion of the particles of a heated body to the ether in which these particles are immersed.*

The luminous ether fills the stellar spaces. It makes of the universe a whole, and renders possible the incessant interchange of light and energy between star and star. But this subtile substance penetrates much further still—it surrounds the ultimate atoms of solid and liquid substances.

Certain bodies are transparent because the ether and their atoms have such relations between them, that the undulations which produce light pass between their atoms without their giving up the motion with which they are animated. In coloured bodies certain undulations are arrested or absorbed, but those which give to the body its colour pass without loss.

The connection of the agent called heat with all the other forces or energies of Nature is such that, when it well dominates, it dominates all the rest at the same time. Even now we can foresee, although in a somewhat dim distance, that the progress accomplished opens new issues, gives birth to new progress, which even those whose skill and genius have laid the bases of present knowledge cannot yet foresee.

Heat produces mechanical force, and mechanical force produces heat: common properties must, then, unite this agent to the ordinary forms of mechanical power. Heat is easily produced by friction, compression, and percussion. Where heat disappears motion is produced; and, reciprocally, when motion is arrested there is a development of caloric.

Place a ball of cold lead upon an anvil also cold, and strike it with a cold hammer. The hammer falls with a certain mechanical force, and its motion is suddenly arrested by the ball and anvil; evidently the force of the hammer is lost. But if we examine the lead we find that it is warm; and if we could collect all the heat engendered by the shock of the hammer, and apply it without mechanical loss, we should be able by this means to raise the hammer to the height from which it fell.

The motion of the mass, as a whole, is replaced by the individual motion of the molecules or atoms of the mass, which constitutes what we call heat. Although intense, this motion is so minute, the displacement of the particles which move is so small, that it is invisible. Wherever friction is overcome heat is produced, and this heat is the measure of the force expended in overcoming the friction. Heat is simply primary power under another form; and to avoid this transformation we must annihilate friction.

When a locomotive approaches a station at the rate of thirty or forty miles an hour the brake is applied, smoke and sparks escape from the wheel upon which the brake acts, and the train is brought to a standstill simply by the conversion into heat of all the motive force which it possessed at the moment when the brake was applied. When a cannon-ball strikes a target it is strongly heated, and the theory of the mechanical equivalent of heat enables us to calculate with the greatest accuracy the quantity of heat engendered by the ball when its velocity is known.

The heat engendered by a falling body increases proportionally to its height, simply, and consequently proportionally, also to the square of the velocity. When we know the weight and velocity of a projectile, we can without difficulty calculate the quantity of heat developed by the extinction of its motive force.

For example, knowing the weight of the earth as we do know it, and the velocity with which it moves in space, a simple calculation gives us the exact quantity of heat which would be generated if the earth were suddenly arrested in its orbit—the number of degrees, for example, which this quantity of heat would communicate to a globe of water of a volume equal to that of the earth. Mayer and Helmhotz have made this calculation, and they have found that the quantity of heat engendered by this colossal shock would suffice not only to melt the whole earth, but to reduce it in great part to vapour. Thus, the sudden stoppage of the earth in its orbit would alone bring the elements into a state of fusion by a fervent heat. And if, after the extinction of its motion, the earth, as would necessarily happen, were to fall into the sun, the quantity of heat engendered by this new shock would be equal to the heat developed by the combustion of 1,600 globes of solid carbon of equal volume to the earth.

It is to the mutual shocks of the oxygen of the atmosphere and the constituent principles of our candles and gas-lights that the light and heat of flame are due. Yet the distances which separate the atoms before their combination are so small that it is impossible to measure them; and yet it is in travelling these infinitely small distances that the atoms acquire a velocity sufficiently great to dash against each other with the fearful energy that produces combustion.

When we strike a bell with a hammer the motion of the hammer is extinguished, but the force which animates it is not annihilated: it causes vibrations in the bell which affect the nerves of hearing, and produce the sensation of sound. In the same manner, when the heavy hammer descended upon the leaden ball, the descending movement of the hammer was arrested, but not destroyed: *transmitted to the atoms of the lead*, it manifested itself to the sense of feeling under the form of heat.

The theory developed in this work, therefore, is that heat is a kind of molecular motion, and that this motion may be engendered by friction, percussion, and compression, as well as by combustion.

* Heat Considered as a Mode of Motion. By Professor John Tyndall, LL.D., F.R.S.

In the next number of the WORKING MAN *will be commenced a series of papers entitled* "LETTERS FROM LANCASHIRE," *by* A LANCASHIRE LAD.

The Inventiveness of the Working Class.

WHEN a large piece of stone is about to be raised to an elevation, it often happens that it slips through the grapnels which clutch it, owing to the friable sides of the stone giving way, in which case the very density of the mass causes the stone to descend suddenly to the ground. On these occasions, new grapnels, of a peculiar construction, have to be devised, and a firmer clutch taken, whose increasing pressure holds the solid stone securely. The working class may be considered as resembling a stone of this description. It is a body of great weight, and of valuable quality, but its sides are friable, and it is seldom raised by the first or second application of the moral, social, or intellectual grapnels applied to it. If its friable parts only are touched, the great body cannot be raised, the "cause of the people" gives way, and displays, like Sir John Falstaff, "an alacrity in sinking." Failure, however, does not warrant despair; it only reveals mistake. It is a matter of mathematical certainty that every physical body can be raised, by one appliance or another; and it is equally certain that social bodies can be raised in the scale of excellence, if the right means are taken. The moral machinery at first thought sufficient may require some reconstruction, or to be applied with more skill and care.

The science of raising the working class is of very recent date; it is certainly not half a century old. Its first principles are hardly yet settled. The experiments have been very few, and, as is the case with all first experiments, very inadequately conducted. The operators themselves have scarcely been masters of their work—indeed, proper appliances have hardly yet been placed at their disposal. An untaxed and ubiquitous press, the greatest appliance ever created, is an instrument that has come so late, that the full extent of its powers and uses is as yet unknown. No wonder, therefore, if it proves that many well-intended appliances devised for raising the working classes should prove less effective, for a time, than their true and sanguine friends had learned to hope.

This is the case, we think, with Industrial Exhibitions. They have been originated mostly by eminent friends of the working classes. The liberality of the rich has been invoked on their behalf, in the way of guarantees and subscriptions; princes, prelates and noblemen have attended personally at inaugurations, to countenance these exhibitions; private collections of works of art have been emptied—Her Majesty the Queen has made loans of paintings and statuary—to add to the attractions of these industrial collections; but the working classes have not been firmly laid hold of yet.

There is no doubt that the Industrial Exhibitions of the Working Class, as they are styled, have been to a great extent disappointments, considered as illustrations of working-class ingenuity, in the way of contrivance or discovery. That workmen are capable both of discovery and invention, there can be no question. The biographies of successful and distinguished workmen and artisans abundantly testify this. While the chief theoretical discoveries and inventions come from philosophical and scientific thinkers, the majority of practical discoveries and mechanical improvements are undoubtedly made by men engaged in the operative departments of manufacture, and the working of machinery. The history of inventions confirms this. At the same time, it must be confessed that Industrial Exhibitions have not hitherto raised the reputation of the artisan for inventiveness, as they were expected to do. We, however, hold to the opinion that these exhibitions are good in themselves—that they will have the effect intended in the end—but that it is too early to expect great results from them; and that they will require to be continued, and to be explained to the operative class, until that class is thoroughly and personally interested in them. This is certainly not the case at present. This will, however, come in due time. As yet the artisans do not understand how great an opportunity is afforded them of displaying, under the public eye, the skill and inventiveness they possess. They do not exactly understand the part they are expected to take, or what the public require to see from their hands. We are not aware that the matter has been sufficiently explained to them. Very few of them contribute any object of industry to these exhibitions in question, and the majority of those who do, send examples of imitatory ingenuity, instead of original inventiveness. Now the scope of working-class inventiveness is infinite. They seem never to have looked into the field at all. Nobody has opened it practically to their view. Confined, to a great extent, to mere mechanical operations, caused by the minute division of labour—to routine and monotonous employment—it is not to be expected that they will or can take all at once an enlarged view of their powers, means, and opportunities. To look beyond themselves into the wide world of progress, and elect their next step of advancement and distinction is more than is naturally possible to them. Even those above them do not seem to see clearly what they might attempt, and our design in this publication is, in some practical way, to assist in this work.

The Glasgow Industrial Exhibition, recently opened—indeed, the very last which has been opened—is equal to any one which the public has seen. The choice of the building, as respects situation and construction, is happy. The managing and arranging committee have acquitted themselves with marked success. The objects of art contributed as loans from private museums and noblemen's mansions—the Queen herself is a contributor—constitute great attractions. When the works of ingenuity there are estimated, contributed by artisans, many deserve high praise, and command considerable admiration. But when we take into account how distinguished Glasgow is for the intelligence of its operatives, what vast ingenuity and resources exist there, lie sleeping there, and which have not been awakened to interest and exertion—when we consider what Glasgow can do, and see all it has done, it is impossible to resist the impression that these Industrial Exhibitions are as yet in their infancy, and that the art of calling out the inventiveness of that class for whom they are designed is not yet perfected. It might be said, in the language of Goethe, as rendered by Elliott, abating a little the rigour of his terms—

> "How like a stithy is this land!
> And men lie on it like good metal
> Long hammer'd by a skill-less hand!
> But will such thumping make a kettle?"

Union amongst Ploughmen.

BY THE REV. DR. BEGG.

THE ploughmen of the United Kingdom, especially if we couple with them the agricultural labourers, form by far the most numerous class of working men. It may also be said with truth that they are the class of men whose social progress and elevation has made least advance of late years. This one fact seems to demonstrate that mere numbers or importance will not command influence, apart from combined efforts in the direction of self-elevation. It has often been doubted whether it was possible for ploughmen and agricultural labourers to combine, and adopt measures for their self-elevation; and it may, no doubt, be admitted, that with men so widely scattered, often so ignorant, and hitherto, as a general rule, so dependent, combination is peculiarly difficult. But the fact, on the other hand, that the only class of working men in the kingdom who have hitherto neglected all schemes of combined action is, at the same time, the class—numerous and important as it is—subjected to the greatest social neglect, and left, as a whole, most hopelessly behind in the march of material progress, seems to proclaim with trumpet tongue the old maxim of O'Connell—

> "Who would be free
> Themselves must strike the blow."

If their combination is only for the purpose of securing righteous and reasonable objects, is conducted in a becoming spirit, and by the use of lawful means, we believe that nothing can be more fair or important for themselves, as well as for the general community. The elevation of a class of the people so numerous and important—the underpropping thus, in a sense, of the whole basis of the social fabric—is a matter of the last importance to all, but especially to the landlords of the United Kingdom. We are well aware that a different opinion prevails in certain quarters. If the work can only be done at the cheapest rate, no matter though the sturdy, educated Saxon is expelled to make way for the more ignorant and lawless Celt, it is supposed by some that an important object is gained. But this is obviously a short-sighted view, as time will prove. The stability of property, as well as the progress of agriculture, and, ultimately, even the increase and regular payment of rents, must have the closest connection with the existence of an enlightened, contented, and well-conditioned labouring population; whilst

> "Ill fares the land to hastening ills a prey,
> Where wealth accumulates and men decay."

Holding these views, we have contemplated with no little interest the formation of what is rather a new thing—namely, a "Mid-Lothian Farm Servants' Protection Society." It has long been notorious that the state of the farm labourers in the richest districts of Scotland bore no fair proportion to the increase of rents, the houses of the farmers, or even to the ample and almost splendid accommodation afforded to all kinds of cattle. Some of the farmers and landlords themselves have nobly advocated a better state of things, and progress in this direction has of late years taken place; but this progress has, upon the whole, been only partial, fitful, and unsatisfactory. The formation of a regular association amongst the men themselves will not only, in all probability, give steadiness and unity to the march of progress, but will create a rallying point for the farm labourers in some other districts, who have still greater grievances of which to complain. The following are the facts which have already transpired. A meeting of farm-servants from districts in the vicinity of Edinburgh was recently held in the Hall at Slateford, for the purpose of considering as to the propriety

of establishing a Protection Society, and of requesting their masters to grant them an increase of wages. There was a very large attendance, and Mr. James Thomson was called to the chair. A proposed basis of association was read, from which it appeared that the main object of the contemplated union was to secure, if possible, fifteen shillings a week of wages, to be paid fortnightly — a very reasonable proposal, one would suppose, in the present state of the labour market—although the men were evidently aware that labour, like every other commodity, must, to some extent, vary in value, according to the actual state of demand and supply. The meeting was then addressed by a working man from Edinburgh, and we have no hesitation in presenting his speech to our readers as an admirable specimen alike of shrewd sense and right feeling.

Mr. COLVILLE, mason, Edinburgh, then addressed the meeting, impressing upon them the necessity of proceeding cautiously in the matter. In his opinion, the most judicious course would be to appoint a committee to examine the draft that had been submitted before coming to a definite decision. He counselled the farm-servants to persevere in their efforts to better their condition, and stated that it was not till they had agitated for about thirty-five years that the masons were enabled to attain the position as a trade which they now occupied. He thought that the demands of the farm-servants were most reasonable, and if they urged their claims in a proper spirit and with energy, the required concessions would no doubt be made by the masters. Whatever meetings the men might hold amongst themselves, they should never try to run down their employers. Such an act could never be expected to do good; but it would always be found to have an opposite effect. They should speak well of their masters, and try by gentle means to convince them that they are not wrong. (Applause.) Some would be disposed to go in for the whole thing at once; but he counselled the meeting not to follow the advice of these men, for if they did so, their movement would prove a failure. Neither should they hold their meetings in public-houses, but when they had business to perform, they should do it in a schoolroom, or a hall, or some equally convenient place. After getting through with their business, they should go home; and if they did this, there was not the least doubt that their employers and the public would respect them. (Applause.) He would recommend, also, the formation of a sick and funeral fund to act in conjunction with the society. His reason for suggesting that was that such a fund would not only benefit the members, but would be a great means of making them pay their subscriptions, as, by not doing so, they would lose something. After the establishment of the society, he would suggest that each employer should be served with a circular, announcing what had been done. He advised them not to put forward their claims till they were sufficiently strong and united to do so with a fair chance of success. That such a movement should prove a failure was ten hundred times worse than if it had never been commenced at all. He advised the farm-servants to strike only as a last expedient, and after fair means had been tried without success.

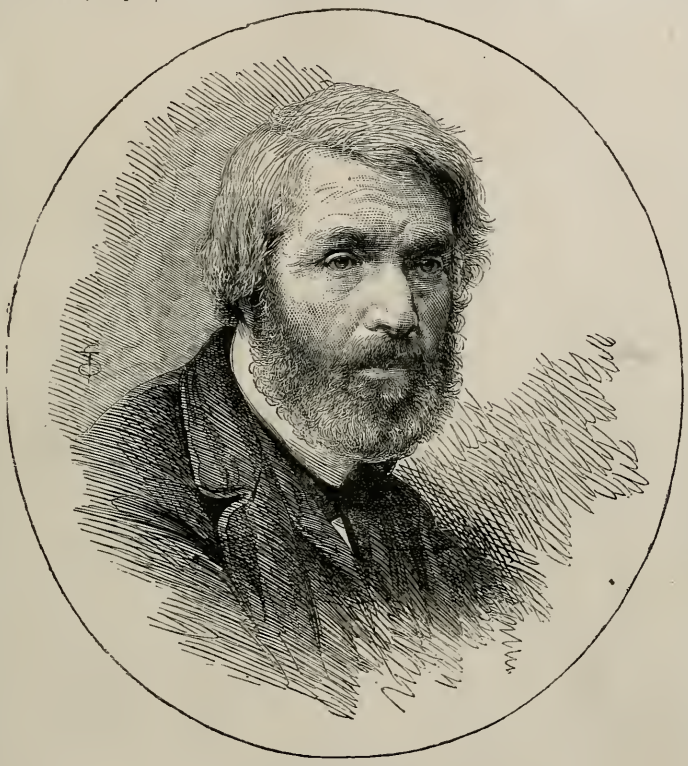
The meeting then agreed to form themselves into a Protection Society, and that steps be taken to ascertain the views of the other farm-servants in the county, relative to the movement.

The following resolution was also agreed to:—

That a society should be formed, having for its object a general union of the farm-servants, not only in the county of Mid-Lothian, but throughout Scotland, with the view of establishing a better feeling between master and servant, and to redress as far as possible the grievances to which farm-servants have been so long subjected, and to obtain for their labour the highest rate of remuneration that the state of the market may warrant them in demanding. It was further resolved, that while this meeting had taken the initiative, measures should be adopted for having the views and sentiments of the other farm-servants in this county and other parts of Scotland ascertained on the subject. A draft of the proposed rules for forming the farm-servants of Mid-Lothian into a society was submitted to the meeting, and remitted to a committee for their consideration, and to report their views thereon at next meeting, and, generally, what steps ought to be taken for carrying out the object of the proposed society in other parts of the country.

The following announcement will indicate the further progress which has already been made:—

On the 24th December, the committee of farm labourers, appointed at the general meeting, met in Slateford Hall, for the purpose of taking into consideration the rules for a Protection Society which had been proposed by their agent. The rules were unanimously approved of, and ordered to be printed. The next meeting was fixed to be held at Davidson's Mains, on Thursday evening, the 4th inst., at nine o'clock.



THOMAS CARLYLE.
(*By permission, from a Photograph by Messrs. Watkins.*)

There are some peculiarities connected with this movement which cannot fail to strike our readers. It is well that its objects are few and clearly defined. But there is one left out which, in our opinion, is most closely connected with the social elevation of the whole class of ploughmen and agricultural labourers, and which we are confident could be most effectually secured by a steady agitation of the kind inaugurated—viz., a uniform supply of good cottages and gardens in connection with every farm, to be as much a regular part of the farm-buildings as the farmer's house and the stables, and other necessary accommodation. Considering the question of the social elevation of agricultural labourers on the range of the kingdom, this is, perhaps, after all, the greatest desideratum. It has the most direct bearing on the comfort of the men; and it is a want, the absence of which nothing can supply. It is a necessity, moreover, which only the landlords of the kingdom have the power to meet. Men in cities can do much towards securing comfortable dwellings for themselves; indeed, if certain existing obstacles were removed, they can by combination solve the whole of this vast problem. But ploughmen are nearly quite helpless. They must take such accommodation as exists, or as the landlords choose to provide, and therefore it is of the utmost importance that a strong public opinion should be created in the direction of a uniform provision of good cottages as one of the standing universal and most urgent duties of all the owners of the soil. It is somewhat difficult to fix upon a precise standard according to which these cottages should be provided; but Mr. George Hope, of Fentonbarns—a most intelligent East Lothian farmer—has suggested that the minimum accommodation necessary for farm-servants, ought to be two cottages for each plough required on a farm—in other words, one for the ploughman, and another to provide for the necessary additional agricultural labourers. These cottages, of course, should at least contain two rooms and a kitchen each, and each cottage should have at least a rood of land as a garden. Such an arrangement might be expected to issue in great good to the whole community—especially to the higher classes—whilst it would impose very little real burden upon the landlords. It would, moreover, in our opinion, afford a definite, legitimate, and most important object for the struggles of a Ploughman's Protection Society, and we venture strongly to recommend it accordingly. How necessary it is that some determined effort should be made to secure such an object, we shall probably illustrate in some succeeding papers, besides giving some information in regard to struggles in this direction which have already taken place.

Thomas Carlyle.

"ALL labour is sacred" is our chosen motto—a text on which many a discourse might be founded. It is one of those pregnant sentences in which a great thinker embodies the secret of his philosophy. Thomas Carlyle, whose words they are, is the man who, in this generation, has preached most eloquently on the claims of great "doers" to the world's admiration. His heroes are those of action—men who, either as lawgivers, warriors, poets, or handicraftsmen, have used their labour as a means of advancing humanity; who have held their work to be sacred, the performance of a duty which devolves on strength. Very often his teachings are oracular, couched in language almost mystical; often, too, wise men doubt the philosophy which is occasionally so hard and cold. But Carlyle is a man of the highest mark, and in his election to the office of Rector of Glasgow University, as successor to Mr. Gladstone, his great genius has been fully recognised.

He was born in 1795, at Ecclefechan, a little village in Dumfriesshire, and was the son of a small farmer. When fourteen years of age he entered the University of Edinburgh, and remained there for seven years. After teaching mathematics at a school in Fifeshire for about two years, he determined to devote himself to literature, and in 1823 commenced his literary career by several able articles in Brewster's *Edinburgh Encyclopædia*, on "Montesquieu," "Montaigne," "Nelson," and the "Two Pitts." He also furnished literary notices to the *New Edinburgh Review*. In the same year he completed a translation of Legendre's "Geometry," to which he prefixed an Essay on "Proportion," and also published his translation of Goethe's "Wilhelm Meister"—a work which betrayed a direction of reading destined to influence materially his future career. On the completion of this translation he commenced his "Life of Schiller," which was published by instalments in the *London Magazine*,

then austained by the talents of Lamb, Hazlitt, Hood, John Scott, and Allan Cunningham. For Goethe and Schiller, two of the "true sovereign souls of German literature," his admiration has ever been unbounded. His letters to Goethe have appeared in the poet's published correspondence. In one of them we find a graphic description of Carlyle's local habitation and mode of life at that period. About 1825 he married, and resided alternately at Arneley Bank and Craigenputtock, a little estate in Dumfriesshire.

In this secluded spot, with a moderate store of books at his command, an occasional contributor to the foreign and other reviews of the day, he remained until about 1830, when he took up his abode in London, and commenced the publication, in *Fraser's Magazine*, of his "Sartor Resartus." In this work Mr. Carlyle gave evidence of much of the peculiar power which characterises his more recent works. In 1837 he published "The French Revolution," a history which abounds in pictures of the most vivid and graphic description. Two years after the publication of this work appeared his "Chartism," and about the same time five volumes of his "Essays," collected, for the most part, from periodical publications. In 1840 he delivered a series of lectures on "Hero-worship," which were afterwards published in a collected form. His "Past and Present" was published in 1843. In 1850 Mr. Carlyle favoured the world with his "Latter-day Pamphlets," essays suggested by the convulsions of 1848—an era which he describes as "one of the most singular, disastrous, amazing, and, on the whole, humiliating years the European world ever saw." His "Life of John Stirling" has been described as "one of the finest biographies ever written." Mr. Carlyle's characteristic, says one of his admirers, is a rugged earnestness of expression, and a range of thought widened and deepened by his acquaintance with the writings of the great German thinkers. In 1845 Mr. Carlyle enriched historical literature with his great work entitled "Oliver Cromwell's Letters and Speeches, with Elucidations," which immediately attracted public attention, and gave him a distinguished place among the historians of the age. His latest work is the "Life of Frederick the Great," a very brilliant work, but unsatisfactory as a tribute to mere strength of will, unaccompanied by conscience.

The Temperance Question:

ITS ECONOMIC ASPECTS.*

WORDS have their histories, and economy has a very interesting history of its own. It appeared in the Greek as *oikonomia*, and was transferred to the Latin under the form of *œconomia;* its signification in both languages being pretty similar—viz., the regulation of household affairs, and provision for household wants. Passing into English, it was first spelt as "œconomy," and was originally confined to the classical sense; but afterwards it shortened its letters to "economy," and enlarged its meaning, by including all kinds of action for securing the utmost benefit at the least amount of cost. Economy is in marketing what the straight line is in mathematics, and as Temperance is the wise regulation of appetite, economy is the wise regulation of expenditure. But while the old meaning has been extended, it has so far flavoured the new word, as to make it natural to associate ideas of economy with family affairs. When used alone, the term instinctively calls up a domestic scene, with the foreground of a careful father and thrifty mother uniting their best efforts to make their means go farthest for their own and their children's good.

It will be conceded by every one that intemperance is anti-economical; for it consumes present means, and forestalls, or cuts off, future resources. It eats up time, health, and industry, and thus renders either saving or getting a difficult, if not impossible achievement. The Temperance question is, therefore, of necessity, an economical one, and every inch gained from intemperance is, in effect, an inch or more added to the territory of a satisfying and ennobling economy. For this reason, if for no other, the Temperance movement should command the esteem and good wishes of every economist. It is the only social organisation that has exhibited a capacity of grappling effectively with social intemperance; and where its success has been the greatest—as, for example, in Ireland, during the Temperance mission of Father Mathew—the economic results were not among the least remarkable phenomena of that wonderful revolution. In Waterford alone, it was estimated that, in 1842, there was at least £100,000 worth of domestic articles in the cottages of the labouring classes beyond the value of such things possessed two years before, besides a considerable increase in the savings banks deposits. Both the power and disposition to economise spring up, as a rule, whenever intemperate habits are abandoned; and if, as computed by Mr. Charles Buxton, the number of families cursed by intemperance in the United Kingdom is not fewer than 600,000, who can set bounds to the extension of economic principles and practices that would accompany the removal of this mass of intemperance, or any considerable portion of it? The Temperance question, as bearing upon the curse of intemperance, is, consequently, entitled to the sympathy of all who wish the sceptre of economy to be swayed over regions now enslaved by drunkenness and waste. As the inebriate must choose between intemperance and abstinence, every economical impulse must incline us to rejoice in the success of the agency that urges him to the safe alternative, and makes its adoption all the easier by the force of example and association.

But deducting 600,000 from the six million families of the British isles, there are upwards of five millions left whose prospects are not beclouded and springs of happiness poisoned by the gross intemperance of their principal members. Shall it be said of them that they have no interest in the economic aspect of the Temperance question except the interest they may benevolently take in the reclamation of the intemperate? That is an interrogatory which the advocates of Temperance would answer in the negative, and they have a right to be calmly and dispassionately heard. They may argue that, if the facts and illustrations of our first paper are to be accepted, they establish a connection between abstinence and economy, not only in the case of drunkards, but of sober persons, individually considered, and therefore of individuals joined in the family relation. If a single man or woman cannot, for the reasons there assigned, spend much or little money in intoxicating liquors, in accordance with economical principles, it follows that married people and parents cannot do so either. Alcoholic liquors do not become more necessary or nutritive when used by husbands and wives than when used by bachelors and spinsters; nor can heads of households pretend to more spare cash than those less fortunate folks who carry their families under their bonnets or their hats. The probabilities run, beyond doubt, in the contrary direction. Unmarried persons may incur expenses without at least the same offence against economic law which married persons would commit, were similar expenses to be contracted by them. A proper provision for domestic needs is a paramount obligation; and these embrace not only present necessaries and comforts, but such a practical foresight and provident arrangement against contingencies as cannot but add largely to the yearly outgo. There are, of course, thousands of wealthy men to whom this consideration does not offer any difficulty. They have enough and to spare; and after making suitable provision for their families, they can afford a good round expenditure on the simple elegances or indulgences of life. Even they, it is to be remembered, are not exempted from the law of using their means rationally and usefully, and no measure of riches can ever justify extravagance and excess. But in all communities the wealthy are the few, and among "the people" the cry of superabundant resources is the last that will be raised. Working men's wages, which vary from eight shillings a week in some agricultural parts to three or four pounds in some manufacturing trades, never permit, economically, of a systematic expenditure for articles of questionable or trifling utility. The artisan has a right to join the "dulce" with the "utile"—the comely and comfortable with the serviceable; but the "utile" must be his first study and his last. The question, then, to be submitted is—Can domestic economy be best exemplified by the use or the disuse of intoxicating drinks? Where liquors are paid for in small sums, or at frequent periods, the yearly aggregate would often astonish were it added up. The expenditure of a family in such drinks *may* be so minute as to place its annual total at a very moderate figure; but, to be fair, we must take the facts as they present themselves in actual life. The annual expenditure of each family in Great Britain on intoxicating liquors, stating an average, is from £12 to £15; and there is reason to fear that, without being chargeable with intemperate habits, the outlay in many working men's families is considerably larger. The late Rev. J. Clay, of Preston, found that out of £154 16s. earned weekly by 131 hard-working men employed by one master, £34 15s. were spent in drink—22·4 per cent., or upwards of one-fifth of their wages. The common fallacy, which makes intemperance synonymous with intoxication, and it alone, conceals from many the loss they and their households suffer from the absorption of a large part of their wages in beer and spirits. Conscious that they do not get "drunk," they conceive that no mischief is inflicted, and no wrong sustained. They do not see that by placing a fifth or a tenth of their wages in the publican's hands they are cramping themselves, and depriving their children of advantages which will be a drawback to them as long as they live. A few pounds a year would make all the difference in the way of a sweeter dwelling, warmer clothes, a better education. Ask the reason why these are not procured, and the answer will probably be, "We cannot afford them"—a true but incomplete reply, which, were it faithfully amplified, would read thus—"We cannot afford them while we buy our regular (or irregular) quantum of liquor." If other evidence were required that domestic economy is sacrificed by very much of the drinking that passes for moderate, and is really far removed from degrading intoxication, it is furnished by the experience of men who have been abstainers for years. Some of these become well-to-do, and their better fortune is sometimes, but not always, borne with the meekness and modesty that adorn the prosperous career. But the great majority of Temperance members in the middle and working classes have no surprising narratives to relate. They say, when questioned, that without spending a penny in drink, they find it enough to do to make home comfortable, discharge husbands' and parents' duties, pay their way, and insure against a rainy day. This testimony is extremely valuable as bearing on the problem how domestic economy may be promoted among society at large. It suggests whether getting rid of the drink is a preliminary condition that must not first be tried. The money spent in liquor is not replaced from any other source, and it does not add to the power of earning a larger income. To say the least, then, it is desirable that the members of every family should take counsel with themselves concerning their account with the publican and the wine merchant—what it reaches to, and what it offers in return. There is an Eastern story of a man who ruined a rival by presenting him with a white elephant—a gift which etiquette forbade him to refuse, and which did nothing but eat up his owner's stores; and if the economy of drinking became a household question, many heads of houses might discover that they had been entertaining, under another name, a wee white elephant, that could not be too soon dismissed from under the family roof-tree.

* Continued from page 3.

A WORD ON CLOCKS.—Ingenious men of all ages, from Archimedes, 200 years B.C., to Wallingford, at the commencement of the fourteenth century, have been cited as the inventors of the clock. The fact is, that the clock, like almost every other useful implement, gradually grew to perfection: one man suggested wheel-work; another the weight for maintaining or driving power; another the balance for regulating the expenditure of that power; another the dial and hands; another the striking parts, and so on; and, at last, one man combined all together in one machine, and gained the credit of making the first clock. This man appears to have been one Henry de Wick, or de Vick, who placed a clock in the tower of the palace of Charles V., about the year 1364, which clock is the most ancient of which there exists any particular description. The principles upon which it was constructed were essentially the same as those of the clocks of the present day—that is, there was a moving power and a regulating power. The moving power was a weight hung to a cord, wound round a barrel; the unwinding of which, by the fall of the weight, gave motion to a train of wheels that moved the hands around the dial. The regulating power was a balance-wheel, swinging backward and forward after the manner of the watch-balance, so familiar to us all.

*Robert Dalby and his World of Troubles.**

A BOOK recently published illustrates the career and capacity of "a child of the people," as the French would say, better than any book which has appeared for years in England. It is entitled "Robert Dalby and his World of Troubles." His "world of troubles"—there is a homely Saxon sound in that phrase which moves the sympathy of common men. The story of the book is the story of a youth of humble station, born on the very borders of pauperdom, who becomes a draughtsman, a craftsman, a carver, a modeller, a painter, and, what implies even wider knowledge and yet more devotion to art, a restorer of old paintings; and finally a "connoisseur." The story is the story of no common man, and told in no common way. It has humour which moves to laughter, and pathos which moves to tears. The laughter is genuine, and the tears flow unbidden. Nor is the book wanting in instruction, such as has rarely been given before in the annals of art literature, animated as it is by a Divine sentiment of veneration for truth and excellence.

It is seldom that a man of genius can tell his own story. Often dulness, amounting to a disease, is epidemical among men whose lives are eminent, and whose powers are a marvel. There was a splendid poem in Oliver Cromwell's life, but it never got into type until Carlyle placed it there. The author of "Robert Dalby" is an exception. His story has a naturalness which surpasses invention. His "world of troubles" of the author must be real, we take it. It is the history of a workman in art whose pictures of English life and incident are as quaint and amusing as any Dutch interior ever painted—as vivid, without the vulgarity peculiar to many of those celebrated performances. The pen of the author of "Robert Dalby" is as clear as the pencil of Canaletto; and in every page there is that fervour of art which lends life and lustre to the bewitching pages of Ruskin. There is no experience so romantic as actual experience, if he who has had it can tell the story of it worthily. Robert Dalby tells it so. There is genius in a pen which can recount an humble story in words to which the reader shall prefer to recur.

In the course of events, in the early career of the hero of the book, Robert Dalby passes some time at a charity school, and rises to the dignity of monitor, the chief distinction being that, instead of being "taught and flogged gratis," he teaches and is flogged without expense, and without cause, also, which is yet more vexatious. To the duties of monitor, he adds those of an errand-boy. He is living, as the reader will see, in a university town. It is thus that the author tells of the difficulties into which his love of art brought him in the unhappy days when he was messenger and monitor.

THE ERRAND-BOY'S FLIGHT TO SCHOOL.

In addition to my attendance at school, I soon had also other duties to perform, hardly less irksome. For a weekly payment of one shilling and sixpence, I became errand-boy to a small stationer, thus filling up every spare moment of my time between school-hours, my dinner, which I carried in my pocket, being not unfrequently eaten as I passed to and fro to the colleges with my parcels at the top of my speed. Among my master's regular customers was a scholar and divine – a fellow on one of the foundations, who, out of a small income, managed to keep a mother and a sister, the latter as beautiful as an angel. This gentleman borrowed oratorios of my master, and in his delightful simplicity, and without design, managed to give me more trouble than almost all the other collegians put together. Scarcely a day passed, without my having to visit this poor quiet scholar. There was one luxury, of which he had long wished to avail himself without stint. His position as a fellow of the college gave him the privilege of using the chapel organ, one of the most perfect instruments in the world. One difficulty only stood in the way of thus rendering himself perfectly happy—that was, he had seldom the means of engaging any one to blow the bellows. One day, while discussing this difficulty, his sister cast her blue eyes upon me in such a way as to leave upon me the impression that something out of the common way was uppermost in her thoughts, and in which I myself was in some way concerned. A small three-cornered note to my master revealed the plot. I was selected to blow the organ bellows for the best of brothers. My master, with his usual promptitude and liberality, returned an immediate answer, placing my best endeavours at the service of his fair correspondent. The favourable response to her request reached the lady, as she sat with her brother at luncheon, at the window of a dark Gothic room overlooking the college gardens. Never shall I forget the expression of that face: never did I feel happier than in thus becoming the humble means of making happier one so good and so fair. Only St. Cecilia herself could have thanked me with so sweet a grace, as, handing me some fruit from the table, she requested me to go over to the chapel porch, and there await their coming.

By the aid of a stool, I contrived to reach the handle of the bellows, and after a little practice was enabled to perform tolerably well the office of supplying the huge instrument with the essential element of wind. Straightway the vaulted roof of the chapel was filled with sweet music, and a soft small voice rose above the organ's swelling tones. The joy of the brother and sister was complete. It was a day in June, sunny and warm. The gorgeous stained-glass windows rained down a thousand bright and variegated tints upon the tesselated chancel floor, and lit up, as with an unearthly radiance, the famous altar-piece, where a fair woman with a neck of ivory, flushed face, and streaming eyes, knelt at a tomb in a garden of roses. It was the Mary Magdalene, on the morning of the resurrection, as she appeared in later times to the rapt vision of an old Spanish painter.

The singer paused, the music ceased, and the lady appeared, as I thought, to censure me for my inattention. The picture had so engrossed my thoughts that I had unconsciously faltered in my indispensable exertions at the bellows. She, however, came not to censure but to thank me for the skill I had exhibited on the occasion, and to further arrange for another day. It was with some difficulty that I aroused myself to my ordinary frame of mind, for the old picture was before my eyes and in my thoughts. Had I not read, even then, of poor boys becoming great painters, and of their being honoured by popes and emperors? And were not vague but alluring images floating in my brain? One of the conditions of art eminence was mine for certain—I was sufficiently poor. Giotto himself could hardly have started better in the matter of his finances; for at the moment of which I am speaking I was not, I believe, in possession of a penny piece.

My delightful dream of old masters and young genius, in the organ loft, was, however, suddenly and cruelly cut short. The last words of the lady had scarcely ceased, when a message from the clock-tower informed me that at that particular moment my harsh preceptor at the school had taken his place at the desk, and had commenced calling over the names of the boys, in which, as a matter of course, my own would not be forgotten. A tremor ran through my whole frame, and well it might. It was a terrible moment for me. One, two! The clock of Saint Margaret's had proclaimed the hour, and out of the forty thousand inhabitants in that old city not one could be found to dispute the accuracy of that quaint, faithful herald of the fleeting moments. What the Horse Guards clock is to the metropolis, St. Margaret's was to Oxenbridge. The fact stared me in the face that I had to run, almost for my life, nearly two miles, in next to no time; and desperate as I was, I made the attempt. In a few seconds I was in the quadrangle and through the porch. The porter just opened his drowsy eyes, as I passed apparently without touching the stones, like as a "Moll hern," all legs and wings,* skims over the moor and along the sedgy shore of the silent stream, taking many turnings and windings, but withal travelling with desperate haste, out of sight before the sportsman is well apprised of his presence, much less has time to take aim. Vagabond boys in every part of the city saw distress in my speed, and got in my way; now and then a dog would rush out from some entry or door-step, and hang impedingly on my rear. Onward, however, I flew. The streets and lanes were narrow, crooked, and dark; but I knew every inch of ground, I might say every stone, and was prepared for curves and angles innumerable. Twice I fell, and scrambled forward as I got up. My cap with the red tassel in one hand, my task-book ("The Chief Truths of the Christian Religion") in the other—onward I still ran. Now I cast my eyes up at the clock of some ancient tower, of which there were several in my route, hopingly—despairingly. Could I be doing the journey in no time? Would the minutes stay their unresting course that I might still escape being "cut in two in the middle," or "flogged within an inch of my life," as the case might be? One clock, apparently at a stand-still, encouraged the hope which another, half an hour in advance, dashed furiously to the ground. The clocks spoke no comfort. Breathless, heated, tired, hungry, terrified, I at length reached that dreadful place of martyrdom—the school. Four steps, a long dark passage, I am in the barn or school-room. Barns and school-rooms were in those days pretty much alike. Instead of the chatter which usually greeted me on my entering the school, all was still and silent with well-known expectation. As I opened the door, a barely perceptible whisper, a noise as of many persons breathing in their sleep, fell upon my ear; and there the schoolmaster—the executioner, the ogre to whom parents used to hand over their children for punishment—stood before me, or rather, I stood before him. The strap—the dreaded strap! a yard long, half an inch thick, with a slit in the end, curved high in the air, and, with a movement rapid as forked lightning, descended on my shoulders, over my chest, across my wrists; hissing scorching, blistering, like a tongue of fire, licking off the flesh, and boiling the very marrow in my bones.

On leaving school some three hours after undeserved punishment and degradation, poor Bob, whose own ill-treatment was still fresh in his memory, came and presented me with a nest of young blackbirds, which he had left at a shop near the school. Such were the only means he had of saying that he sympathised with me as I had often done with him under similar circumstances.

There are freshness of incident in this chapter and a certain felicity of variety—touches both of nature and art. The "Flight to School" is a picture likely to live in the memory. Other chapters of simpler construction are more remarkable for quaint, Saxon directness of expression. In chapters entitled the "Picture Magazine" and the "Caricature," the author recounts experiences which have occurred to many, and have been told by few. The "Order for the Hangman" is a chapter of terror without morbidity. Few readers will have surmised the traditions of murder visibly illustrated in a country rope-maker's shed. There is material for many stories in Robert Dalby. The later chapters are the adventures of an artist, in which the varied education of a connoisseur is traced step by step, in a way that makes the book an addition to the literature of art-education.

ELECTRO-METALLURGY.

MR. WEIL'S IMPROVEMENTS.

THE baths employed for depositing metals upon each other are salts or metallic oxides held in alkaline, sodaic, or potassic solution, either, as is most frequently the case, by means of organic matters, such as tartaric acid, glycerine, albumen, or any other substance that will prevent the precipitation of the oxide by the fixed alkali, or by an excess of the fixed alkali itself.

The inventor effects the metallic coatings by means of these baths, according to the different cases, either with or without contact and concurrence of the zinc or metallic lead, at the ordinary temperature, or at a temperature more or less elevated.

By means of immersion in baths of similar composition we can also colour in different tints, and bronze at pleasure, the metals previously coated with copper.

Mr. Weil attaches most practical importance to his processes of bronzing and coppering iron and steel, seeing that by means of the processes now in use we not only do not obtain sufficient adherence, but we are also obliged to cover these metals previously with several coats of foreign substances, conductors of electricity, before submitting them to the action of the battery and sulphate of copper.

Iron and steel are not only coated with copper by Mr. Weil's processes with a characteristic solidity which admits of their being readily distinguished from the same metals coppered and bronzed by methods in use, but he can also vary at will the colours of them all, and produce a series of results hitherto unattainable.

He can also, by the means described, apply silver, nickel, &c., to iron and steel coppered by the processes now under consideration. They are susceptible of a great number of useful applications in the arts of the most interesting kind, which the inventor has particularly studied, but which are too numerous to be enumerated here. Articles in iron and steel thus coppered or bronzed will, if sheltered from rain, resist all atmospheric agents at the highest temperature. They equally resist water, provided they be wholly immersed in it.

For the same objects coppered by Mr. Weil's processes to equally resist rain—that is to say, the alternations of dryness and humidity, and sea water—a greater thickness is given to the coating of copper, either in the electro-bath, that is, by means of the battery and an acidulated solution of copper, or by the battery, and special solutions prepared by the inventor. The adherence of the copper to the iron and steel treated by Mr. Weil's method being complete and perfect, a supplementary thickness of a fraction of a millimètre given by the battery is fully sufficient. Articles thus treated, while faithfully reproducing the most delicate details of an ornamented work, possess all the solidity desired.

The process therefore gives at the same time a very considerable economy and marked advantages over the processes now in use.

In conclusion, the inventor quotes a fact, which, in a theoretical point of view especially, presents some interest. Mr. Weil has found that scraped copper becomes covered with an adherent coating of zinc by the contact of the metallic zinc itself, in a concentrated solution of caustic soda or potassa. This zincing takes place immediately upon warming the bath from 170° to 212° Fahr. If cold, it takes place only at the end of a variable space of time, according to the alkalinity of the bath, and then only incompletely.

Art and Handicraft.

III.—THE PRIMARY WANTS OF THE MANUFACTURER AS *A DIRECTOR.*

THE position of the manufacturer in the matter of art as applied to industrial productions, has not been an enviable one for many years past. A growing desire on the part of the public for objects of utility, in which certain acknowledged principles of taste should be visible, and the fact that those whose business it is to stand between the manufacturer and the public either could not or would not appreciate the efforts to meet the demand, or who pertinaciously denied that it existed, was not a condition of things calculated to give confidence to the producer, however enterprising, who wished in all sincerity to meet the markets of the world in the advanced condition which a better appreciation of the value of art, as an industrial adjunct, seemed to indicate. The *buyer*, to sell again—that is, the warehouseman or shopkeeper—would not buy what he considered he could not sell. Habituated for an indefinite period to have the matter pretty much in his own hands, the middle-man got it into his head that he was the true arbiter of public taste, and therefore whatever he said was good and beautiful, must be good and beautiful, and in the most perfect taste, to his customers. If, as frequently happened—and, unhappily, one has to say, continues to happen still—the customer is as ignorant of art as the shopkeeper, then all goes well for the latter, and he still buys his *uglies* and calls them *beauties*. Mrs. So-and-so, the rich merchant's wife, buys them to-day because the Hon. Mrs. Dash bought the same things yesterday, the latter having bought them because the Duchess of Fitz-Fashion bought them the day before, under the assurance of the seller that they were "positively the newest things out."

Now, all this has nothing whatever to do with the question of true art or design, and intelligent, because artistic execution; but, unhappily, it has almost everything to do with the great question of what the manufacturer shall make, and, consequently, with what the workman shall have to execute for him.

The manufacturer, then, as the *director* of the execution of the works which it is his province to supply to the public, through the shopkeeper, is often helplessly and hopelessly in the hands of the latter, so far as any advance of taste is concerned. When, however, this is not the case—and there are, happily, many instances of this kind of independence, and they are daily growing more and more numerous—the manufacturer as a producer can study the whole question for himself. He can ask himself the question which such a man as Josiah Wedgwood asked himself in the past time, and Herbert Minton and others have asked themselves in our day—"What is it that will best lead the public to better appreciation of the really beautiful and the logically tasteful in our industry?" and he will find the same answer which they found—*the gradual but sure movement out of the ugly and the tasteless.* Not by a sudden leap—not by violent changes in the habitual order of things, but by the gradual improvement of the best of the old types, until the time comes when they are improved out of sight, and their position taken by new forms, new styles; the basis of these designs being such as can be understood and appreciated from a fixed principle of action—all innovations and caprices being discarded, as inconsistent with a manufacture where science gives the structure, and art furnishes the adornment.

It need scarcely be said that the manufacturer will need all the aids which sound instruction can give him, quite as much as the workman. Indeed, if he is to keep his position as a leader and director, he will need much more: for that which the workman has to deal with in small details, the manufacturer has to look at and consider as a whole. The history of our most successful industries is full of proofs how much of the national success in trade and manufactures has arisen out of the painstaking intelligence with which individual manufacturers have developed some distinct and well-matured plan of action, which, in a few years, has changed the whole aspect of the special productions on which such a man has been engaged—the *impossible* of yesterday becoming, unmistakably, not only the *possible*, but the *actual* of to-day.

As a matter of course, there will be followers as well as leaders in the arts, as in everything else. He who aspires to lead should fit himself to do so, on the distinct and unassailable basis that he knows exactly what it is he wishes, hopes, and really intends to do, and goes about his work as if the doing was a matter quite settled, on two distinct points at least: first, that it is the right thing to do; secondly, that he means to do it.

Fig. 1.

Let the mere follower take his course, and be content to keep in it. His business is to go *after* somebody else. As only curs bark at people's heels, let such be content simply to follow when, where, and how they can. Let the fashionable dealer in conventional *uglies* lead *them*; but, above all things, let them refrain from opinions on art, or taste, or beauty. Let them stick to what will "*sell*," as the perfection of the industrial operations in which they are engaged: they can ignore art and design as much as they please; but let them not profane either by quoting them as having anything to do with their productions. Let art-schools be the pestilent heresy in manufactures that they have been to so many of these people; but let them keep away from them. Above all, let them be honest enough not to meddle with what they do not and cannot understand, and to avoid taking any share in the management of such institutions; for experience has proved that, either accidentally or wilfully, they have generally contrived to do them more harm than good. If a man cannot appreciate a principle, he had better not meddle with it. He may deny its existence, and be useful even in his opposition, if the principle is true. Affected belief is the worst form of infidelity in science and art, as even in higher things.

George Wallis

Art Designs

FOR USE IN TRADES AND MANUFACTURES.

NIELLO WORK.

Several attempts have been made of late to revive the curious and beautiful art of niello, once so popular in Italy and other countries. At the Exhibition of 1862 several specimens were shown, which possessed much excellence, although very far from equalling in artistic feeling the productions of France and Italy. There are, however, many reasons why we cannot produce, at the present day, niellos comparable to those with which Finiguerra has enriched the gallery Degli Uffizi at Florence. We must be satisfied with imitations more or less successful, as articles of trade. In this respect Russia holds the first rank. The town of Toula is the centre of a very interesting and important manufacture of niellos in silver, and particularly in platinum, consisting principally of snuff-boxes, which enjoy a well-merited reputation.

Niello is the name given, in Italy, to a compound of silver, lead, sulphur, and borax, melted together. When cold and hardened, it is carefully washed and reduced to grains of the size of the finest millet-seed. In this state it is applied to a plate of engraved metal, which fusion causes to flow into and fill up the lines made by the graver. The plate is then withdrawn from the furnace, and when the incrusting matter has become solid the plate is scraped, so as to leave in the lines the quantity of niello sufficient to fill them. When the surface of the plate is polished the design has the appearance of having been drawn with a pen. This work, preferably executed on silver, has a very pleasing effect, and is called *Lavoro di Niello.*

The origin of the art of niello, about the year 1460, is attributed to Maso Finiguerra, a goldsmith of Florence. He engraved upon silver plates not only ornamental designs, but historical and mythological scenes, which became really pictures when nielloed. These works contained the germ of the art of chalcography, to which, in fact, it subsequently gave birth.

After putting the last touches to his engravings, Finiguerra was in the habit of taking an impression with very fine clay. Upon this mould he afterwards poured liquid sulphur, which gave him an exact copy of the original plate. He then rubbed the sulphur-cast with a mixture of soot and oil, in order to ascertain the effect of his work. A sheet of paper—or as others say, a wet rag—having accidentally fallen upon this cast, it received an accurate impression of it, which gave the artist the idea of multiplying these copies, and thus the art of engraving on metal was created.

This discovery, which spread abroad rapidly, soon cast artistic niello into the shade. It continued, however, to receive applications on a large scale; for those are real niellos, the designs engraved and incrusted in marble, which form the pavement of the choir of the Cathedral of Sienna—niellos so precious, that they are usually covered with boards to protect them, which are removed only once a year, and even that rare exposure is too much for their complete preservation.

Niello was known to the ancients, as is proved by the name the Greeks bestowed upon it. The Romans called it *Nigellum.* The art was also practised during the Middle Ages. In the manuscript of Heraclius, written about the eighth century, may be found a recipe, probably of Byzantine origin, for preparing niello. The treatise

on the arts, by the monk Theophilus, translated by Mr. Hendrie, contains another recipe.

Very remarkable works in niello are scattered through most of the public and private collections of Europe. The museums of London, Paris, Madrid, and Turin, contain panoplies of rare excellence in this kind of work. But it was in Italy especially, at the date of the Renaissance, that niello took a character which raised a process more or less mechanical to the high dignity of an art.

Several rings ornamented with niello work have been discovered in Lancashire, bearing the following inscription in Anglo-Saxon:—"I belong to Æthred—Eanred made me." Other niellos, of English and foreign fabrication, are celebrated—among others, an altar of oriental jasper, with ornaments in niello of silver gilt, of the thirteenth century. After forming a portion of the treasure of the abbey of Avelscana, it became the property of the Rev. Canon Rock.

Niello work is well deserving the attention of our skilled artisans, especially those who handle the graver. There are numerous branches of trade to which it is applicable—among others, to the embellishment of silver watch-cases, to silver snuff-boxes, caskets, presentation plate, &c.

Our woodcuts (1, 2) are copied from a niello-worked box of the sixteenth century. Fig. 3 is a beautiful specimen of arabesque work, in which the interlacings are extremely complicated, without producing confusion. It is a pattern of good taste, well deserving imitation.

Things Talked About.

THE administrators of the Peabody Fund have given an account of their stewardship. It is proverbially difficult to please everybody; and it is not likely that the mode in which they are employing so large a fund as £160,000 will escape cavil. Some dissatisfied claimants and projectors there are sure to be; but we think that the general opinion is that the trustees have acted wisely in selecting the erection of improved dwellings for the working classes as the object to which the splendid donation should be devoted. Every year makes the claims of the working classes to comfortable homes, near the places where they earn their bread, more urgent; and Mr. Peabody himself, we believe, would hardly wish that his benevolence should have another result. The trustees have already expended about £85,000, and for that they have to show the buildings at Spitalfields, where 200 persons—say forty or fifty families—are well housed; large plots of land for similar erections at Chelsea, Bermondsey, Shadwell; and a magnificent block of buildings, divided into 155 tenements, at Islington. The tenants belong strictly to the working classes; and it is pleasant to note that their health is far above the average.

A society has just been established in the Potteries, which offers an attractive prospectus. It will be well, however, if the plan be carefully examined before acceptance; there have been many failures in the same direction. The project consists of an Emigration and Building Society, the objects of which are defined to be "the removal of surplus labour by emigration, and the erection of cottage houses on freehold land at home." There is nothing novel in either object; but emigration schemes—notably the Wisconsin project, by which so many were deluded some eighteen years ago—have so frequently failed, that, as we have said, caution is necessary. However, this scheme appears to be more feasible, as no settlement of emigrants is intended, but only allotments of £20, for emigration purposes—the recipient to choose his own destination. The subscription is sixpence a week, and the annual allotment for building purposes to forty members is to be £10 each. The prospectus appears to require re-consideration, and an examination of the balance-sheets of the best conducted freehold land and building societies would be of service.

A very interesting movement is being made to obtain for the north of London a museum somewhat similar in character to the South Kensington Exhibition, though, of course, on a smaller scale. The provisional committee suggest that the proposed museum should include novel and practical applications of science, examples of the arts of design and decoration, technical and inventive industry, and illustrations of domestic and sanitary economy for the furtherance of health and comfort, with a view of aiding working men and their families to "turn to the best account the common things of every-day life." Need we say that we wish well to the undertaking?

How frequently we read of fatal accidents to men employed at railway stations and about railway work! Some are no doubt due to the carelessness of the men themselves, but we cannot help thinking that better precautions should be enforced by the managers of railway companies. Plate-layers, shunters, and porters are frequent victims; and one form of accident—that entailed by the train starting before the porter who couples the engine and carriages has time to quit the lines—has been several times reported lately. It is scarcely possible to visit a junction station without seeing great recklessness in this matter, a recklessness which strict regulations would restrain.

The subject of railway servants suggests the case of the men employed on the London and Blackwall line, now transferred to the Great Eastern Company. The men, many of them very old and faithful servants, have been discharged at a moment's notice. Surely some compensation for the sudden loss of the means of livelihood might be afforded. It is a bad time of the year for poor men to be out of work.

Greater consideration has been shown by the London and North-Western Company, which has built and opened a large sewing factory at Crewe, where the unemployed women of that railway town may find remunerative employment.

The South Staffordshire iron trade is dull. Very much of the future of the trade, it is said, depends upon the demand from America. We have little fear that that demand will materially slacken.

Iron and coal are so nearly allied, that we turn to notice the revival, in the columns of our clever and popular contemporary, the *Daily Telegraph*, of the old controversy as to the probable duration of our native supply of coal. Whether we ought to stint ourselves for the sake of posterity, or whether we should leave posterity to take care of itself, trusting to the yet undeveloped resources of science, is a moot question in ethics, which we shall not now attempt to argue. But one or two facts are worth noting. Eighty-five millions of tons are annually raised in Great Britain, and the demand is increasing; so, too, is the price. Yet we have been told that the South Wales coal-fields alone could supply the country for the next four hundred years. That statement was contradicted by Sir William Armstrong, a great authority, who limited the supply from all our coal-fields to 212 years; and now other scientific investigators tell us that in less than half that period there will not be a scuttleful left, so that our grandchildren may see the time when England will be fireless.

The London velvet weavers, who earn no more on the average than 11s. a week (little enough that), have lately had to submit to a reduction of wages, to the extent of 12½ per cent. That seems to be the last straw that breaks the camel's back.

A workman employed at the Vauxhall Glass-works, at Liverpool, has been brought before the magistrates, charged with absenting himself from his work without permission. He had thereby rendered himself liable, under the 4th George IV., to six months' imprisonment. He was, however, in consideration of his good character, and an expression of sincere regret, discharged with a reprimand, upon giving his recognisances to attend to his work. Thousands of workmen, we venture to say, know nothing of the existence of such a law. It is rarely put into operation, but it is as well its provisions should be known.

The clothiers' assistants in certain busy metropolitan neighbourhoods are very reasonably getting tired of Sunday work. Shops for the sale of clothing are kept open all day; and the necessity of a change of system was well enforced at a meeting held last week at the Lambeth Baths. We wish their efforts at emancipation every success.

Earl Dudley has given £5,000 towards the purchase of the arboretum at Worcester—a fine pleasure-garden—in order that it may become the property of the city, for the recreation of the inhabitants.

Mr. Nicholas Hood, of Hetton Hall, Durham—one of the earliest employers and friends of George Stephenson, an improver of the locomotive engine, and a staunch friend of the working man—recently died, at the ripe age of seventy-one.

The interesting papers read before the late congress at Sheffield, which were fully published in the journals at the time, are now being supplemented in a very instructive and agreeable manner. One of the Sheffield journals (the *Independent*) recently offered £24 for essays by working men, on subjects rising out of the congressional discussions. The results are now showing themselves, highly favourable to the industrial order. Considerable numbers have competed, and some excellent essays have appeared. Two first prizes have been awarded to a grinder, who took part in and was complimented at the Association's last meeting. Two second prizes have been awarded, one to a blacksmith and one to a compositor. A principal prize has also been awarded to a compositor, while the second place has been obtained by a clerk in a file warehouse. These essays, together with the correspondence they elicit, form, indirectly, an important appendix to the society's transactions; and while, also, they arouse latent talent in some of our better-class artisans, the essays place before the public information which would be otherwise difficult to obtain. The next meeting of the Social Science Association will be held in Manchester. We trust the working classes of that city will have similar inducements and opportunities for displaying their abilities and informing the public mind, to those of which the Sheffield artisans are now availing themselves.

General Information.

WAGES.

THE MINERS OF NORTH STAFFORDSHIRE.—A recent application for an increase of wages from the miners in the employ of Earl Granville, was brought before the quarterly meeting of the North Staffordshire Coal and Ironmasters' Association at St ke-on-Trent on Thursday, the 4th inst., when it was decided, on account of the improved state of the coal market, to advance the wages of colliers and ironstone miners throughout the district from 3s. 6d. to 3s. 9d. a day.

CHAIRMAKERS.—A meeting of masters and journeymen in the above trade was held on the 9th inst. at the Albion Hall, London Wall, to discuss the question of a rise of ten per cent. on the present rate of wages required by the operatives. Delegates representing 900 men were present, and about thirty of the leading employers in the trade. Mr. M'Donald, an operative, took the chair. He detailed the reasons which had induced the men to request the advance, and hoped the employers would be prepared as a body to concede the advance by the first week in February. Mr. Lewis, an operative, desired to assure the employers they were actuated by no aggressive feeling towards them, and were open to receive any fair and reasonable proposal. Their desire was to meet the employers in the most liberal spirit; but there must be a rise in wages, the present rate not being sufficiently remunerative for a skilled workman. Several other workmen having spoken to the same effect, Mr. T. Turner, on the part of the employers, said he attended the meeting with much pleasure, to discuss the matter in an amicable spirit. He and other employers were present that evening to hear from the men themselves a statement of their grievances; and although they were not prepared to give a definite reply that evening, they were willing to give a promise that a general meeting of the employers should be very shortly held, when the whole question should be fully discussed, with an anxious desire, if possible, to meet the wishes of the men. He must remind the meeting, however, that the large wholesale houses in the trade would have a voice in the matter, and he believed they were generally averse to the movement. The discussion was continued for a considerable time in a most friendly spirit, and it was ultimately resolved by the employers that they would obtain the opinion of the trade between the present time and the first Tuesday in February, and communicate its decision to the delegates of the workmen on that date. Although the men seemed determined to adhere to their demand of ten per cent. advance, there was a general wish to avoid a strike.

CLUBS.

It is gratifying to be able to report that since the establishing of the Netting Hill Workmen's Club, by that zealous and philanthropic lady, Mrs. Bayly, wife of Captain Bayly, of Barnet, it has produced the most gratifying results, both as regards commercial success and social improvement. The hall and reading-rooms are always open to the workmen and youths residing in or about the neighbourhood, who repair there of an evening and enjoy themselves with innocent and wholesome recreation and amusement. The library is well supplied with periodical and magazine literature, as well as with works of a more philosophical and deeper import, whilst "Penny Readings," given each Friday evening, contribute greatly to the improvement and instruction of those attending. Nor are lectures wanting to fill up the deeply interesting programme of this valuable institution. On Tuesday, Jan. 9, a most interesting and valuable lecture was delivered in St. James's School-room, in connection with the club, by Mr. Gale, the inventor, on the means by which powder is rendered non-explosive. The lecture was well attended, and was presided over by Mr. W. Saunders, of Plymouth, who was accompanied on the platform by the lecturer, Mr. Gale, Mr. Parfit, Captain Bayly, and other friends. Mr. Saunders having, in a neat, appropriate speech, introduced Mr. Gale to the audience, that gentleman, who is totally blind, gave a lucid explanation of the circumstances under which he accidentally discovered the ingredient which, if mixed with powder, would render it completely harmless and non-explosive. When a youth he was very fond of making up and of letting off fireworks, but his pocket-money not being sufficient to purchase the necessary amount of powder required by him, he, in his efforts to cause the powder to go as far as possible, discovered that the substance now used by him completely annihilated the explosive power of the powder. Mr. Gale then made some deeply interesting experiments of the same nature and character as he had done before the Prince and Princess of Wales, during which he applied heat and light to small masses of powder without procuring the least explosive effect. But what renders this discovery the more invaluable is, that after having been separated from the substance which for the time being rendered it non-explosive, the powder is found to retain all its explosive properties, and the same strength it had previously possessed. The lecture was of the most interesting character, and afforded a large amount of gratification to all present. In connection with the club are several local clergymen who extend to it their patronage, and occasionally lec-

ture or read there, among whom is the respected incumbent of St. Marks, Rev. E. Kendall, M.A.; Rev. W. Allen, M.A.; Rev. Mr. Dunn, &c. The refreshment department, under the superintendence of Mr. Odell, the manager, is well supplied, and affords comfortable and cheap accommodation.

THE annual general meeting of the members of All Souls' Working Men's Club and Institute was held at the club-house, 73, Great Titchfield Street, on Monday evening last, and was adjourned to the 22nd instant. The Rev. E. R. Eardley Wilmot occupied the chair. Hodgson Pratt, Esq., W. Thackeray Marriott, Esq., Mr. Pocklington, visiting agent, from the Working Men's Club and Institute Union, and Mr. Borrow, honorary secretary of the Camden Town Club, were also present.

WORKING MEN'S CLUB AND INSTITUTE UNION.—The monthly tea-meeting of secretaries of metropolitan clubs held by the above society took place on the 4th inst., and gave rise, as usual, to a very useful and interesting discussion. The chair was taken by the Rev. H. Solly, and besides various representatives of Working Men's Clubs, Edward Hall, Esq., and Mr. John Bainbridge, members of the council of the Union, were present. The first point discussed was, "What are the Indispensable Elements of Success in a Working Men's Club and Institute?" The advantage of visits from persons in a higher social position, and having more leisure time, culture, and acquaintance with business than working men generally possess, was unanimously endorsed. Reference was made by three or four speakers to clubs with which they had been acquainted or connected, where the evils from which clubs so often suffer had been—or, in other cases, evidently might have been—avoided, if one or two gentlemen had interested themselves in the affairs of the club. As, however, the discussion was chiefly a development and confirmation of the arguments advanced in the letter which is given in another part of this journal, we pass on to observe that the next essential element of success referred to was an active committee, the members of which not only provide suitable entertainments, classes, &c., but take it in turns to play the host, and make the members comfortable and happy. A third requisite mentioned, of course, was good premises, in a suitable locality; and a fourth was efficient attention to the refreshment department. Many valuable remarks were made on all these points, which we propose embodying in a series of short papers under their respective heads. These monthly conferences have always been useful and pleasant, whether attended by many or few; but of course a larger amount of experience would be gained if each metropolitan club committee would take care that some one of its members attended on each occasion. It is not necessary that such member should be the secretary, or even on the committee. The meetings are quite informal and unaffinial. The Council of the Union offer a hospitable welcome, and in return simply invite the communication of such facts and arguments as may be useful to the persons present, and, through their own machinery, to clubs generally. Thus, no formal appointment of a delegate or representative from the club is necessary. All that is required is that some member of each club, possessing a reasonable amount of experience in connection either with the club he comes from, or any other, should present himself (in a cheerful frame of mind if possible—if not, at least willing to be cheered), about half-past six p.m. at the office of the Union, 150, Strand, on the night fixed for the meeting, bringing an introduction from the secretary or committee, should he not be the one, or belong to the other. The talking part of the business generally commences about half-past seven; but a late cup of tea (perhaps of that quality usually connected with the head of the family), will doubtless be attainable for any deserving, but tardy clubbist, as late as eight o'clock. Nobody, however, had better count on such indulgence—though everybody is better late than never—but let us have the pleasure of beholding them in time for a suitable meal all together. The next meeting will be held on Thursday, Feb. 1. We would strongly recommend our friends in other parts of the country, wherever there are a few clubs within a "speaking distance" of each other, to institute similar pleasant and profitable *ré-unions* to those held in London. The South Staffordshire Adult Education Society has adopted a comprehensive and admirable system of periodical meetings for the promoters and managers of clubs, institutes, and night schools. The Southern Counties Adult Education Society, the District Union of Clubs formed recently at Winchester, Newcastle, and Manchester, as well as that which we hope soon to see formed for clubs in Yorkshire, under the presidency of Lord Houghton, might all adopt measures for bringing representatives of clubs and institutes together for a social meeting and profitable confab, once a month, or once a quarter, according to the facilities of travelling in the district.

WE beg the attention of all Committees and Secretaries of Clubs to the forms to be filled in with various particulars, which have been forwarded to every club with which we are acquainted in the kingdom, and earnestly request that those who have not yet returned them will kindly do so on or before the 15th, or as soon after as may be convenient. The Council are desirous it should be clearly understood that the information requested is asked for simply to promote the success of the movement generally, and the prosperity of individual clubs, which depends to so great an extent on learning the experience of each other, and mutually gaining a knowledge of what is being done elsewhere. The Union has always disclaimed the slightest idea of exercising any kind of control over Working Men's Clubs and Institutes, whether affiliated to it or not. It has neither the right nor the desire to interfere in any way with their management. We want only to render them all as much service as may be in our power, and with that view invite the cordial co-operation of their managers and promoters in every rank and district.

CHESS COMPETITION.

THE Council of the "Working Men's Club and Institute Union" having offered a prize, of the value of Two Guineas, to the successful competitors at a chess tournament, to take place some evening in the course of the month of February, secretaries of clubs are requested to send in the names of intending competitors to the office, 150, Strand, on or before the 31st of January. In accordance with the terms previously announced, they are also requested to give to those members of their clubs who intend competing certificates that they have been in membership for not less than six months. The competitors will be divided into parties, to play each one game, the winners afterwards to compete successively with each other.

EMIGRATION.

EMIGRATION FROM THE CLYDE.—During the year ending the 31st December, 1865, there have been 15,277 emigrants dispatched from the Clyde, being 4,888 more than the number who sailed in 1864. Of these, 10,033 have gone to the United States, 2,582 to Canada, 1,510 to Queensland, 930 to New Zealand, and 217 to various other parts of the world.

Correspondence.

**** We shall be happy to receive any information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* WORKING MAN, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

THE WORKING CLASSES.

To the Editor of the WORKING MAN.

SIR,—It is with pleasure that I take this opportunity of thanking you for the production of such a journal as the WORKING MAN, destined to be the medium for the thoughts of the working class to appear before the public at large—to be that intellectual field where those that may have something to say worth listening to will always be sure of finding a space for their words.

It has been truly said that this is the age of the working man. The one thing that has hitherto been wrong (which I hope and believe your paper will help to set right), is that we have not in the main been listening to the voices of the working class, but—as in one case you have defined it to a nicety—the frothy utterances of noisy demagogues: not that I would include all those working men who have proved themselves able and clear speakers and thinkers; far from it. Still, I unhesitatingly affirm that the majority of those who have assumed to be the leaders of the trades, have lamentably failed in introducing a better and a higher state of things than those wherewith they started.

We have also had another and a very numerous class—namely, those men who, seeing that the workpeople were becoming a vast moving power in society, have put themselves forward to be the exponents of our thoughts and aspirations, claiming to represent us, while, in fact, they have, and still continue to misrepresent our wish, actions, and intentions. The correspondent in your first number gives a case in point. Again, some have come forward, like the poet Cowper describes—

"Whose thoughts contemplative have dwelt
In situations that they never felt—
Start up sagacious, cover'd with the dust
Of dreaming study and pedantic rust,
And prate and preach about what others prove."

Some have thought to patronise; there they have summarily failed: we are too shy of anything that savours of patronage to be thus caught. It is as well that it is so; we are not babies, but grown up men and women: we must work our own redemption if we wish it to be enduring. Hence, I must again repeat that I look upon your paper as one of the best steps for the advancement of the working class that has ever been proposed or carried out.

If my fellow-workmen will take this to heart, they can greatly add to its usefulness by extending its circulation. This can easily be done. I will give an example. I spoke to several of my own trade (stonemasons), and asked them if they were not going to buy the WORKING MAN. This led them to ask me for particulars, which I gave, and they promised to buy the paper. Well, if every one of those who believe in the aim of the paper will try to get a mate to purchase it likewise, that would double its sale at once.

In conclusion, Mr. Editor, I would fain press upon your notice one thing—viz., that, though it is well known that we have many vices and follies, it is as well known that we have many noble natures. Knowing that, I hope you will deal tenderly with the men and women, while you give no quarter to vice, follies, and crime prevalent, remembering that we are not all intellectual thinkers, but that there is a vast amount of dense ignorance amongst us. You will, while recognising this, strive to find a way to lift our fellow-workmen and women into the realms of reason and knowledge. To make your work effectual you must be supported by the intellect of the working class. I am, sir, &c.,

L. J. H.

27, Brixham Terrace, Wandsworth Road, Lambeth, S.

SUNDAY EVENINGS FOR THE PEOPLE.

To the Editor of the WORKING MAN.

SIR,—I noticed the other day in the *Times* an advertisement headed as above. The purport of the advertisement is, that from Sunday evening Jan. 7, to Sunday evening Feb. 11, public discourses will be delivered in St. Martin's Hall, that selections of sacred music will be played each evening, and that the prices of admission (by ticket) vary from 2s. 6d. to 3d. Back seats free.

The lectures are all of a secular character, and will be delivered by men eminently qualified for the task—such, for instance, as Professor Huxley, Sir John Bowring, Dr. Carpenter, &c. There can hardly be two opinions as to the popularity which will attend these lectures, and a second series will probably follow the first. But, sir, is it very Pharisaical to ask, "Is it right such lectures should be delivered on Sunday evenings?" The time when they are to commence is 7 o'clock, or during the time Divine service is celebrated throughout the length and breadth of the land, which somewhat jars on my perhaps over-sensitive mind. Moreover, the scheme is an affair of cash, after all, although no money be taken on the Sunday. And as to sacred music accompanying secular lectures, that, in plain language, is but a subterfuge. It is noticeable that the name of no reverend gentleman appears in the programme. Some clergymen might vary the entertainment by giving a "Reading" from the Poets, but I hardly think any one would deem it consistent with his calling to do so. In fact, there is no need that these discourses should take place on Sunday at all.

The above, sir, are my honest opinions. They may not be popular, and many of your readers may take exception to them. This is, however, a question which eminently concerns working men, and therefore a fit topic for discussion in your columns. I am, sir, your obedient servant,

Jan. 6, 1866. A BOOKSELLER'S ASSISTANT.

ARTISTIC WORKMEN.

To the Editor of the WORKING MAN.

SIR,—Will you allow me, as a working man, to say a few words respecting the unartistic character of the generality of my class? In your article on "Trades Unions: their Limited Sphere," you say, "A workman should be a thinker and an artist." I think there are very few skilled workmen but really do take a pride in their work, and would do it in a far more artistic manner if they were allowed; but they are not. I am a moulder, and in the shops where I have worked I have invariably found that it is not so much the artist that was wanted as mere strength, allied with a little intelligence, of course. That man who could do the most work, just sufficiently good enough to suit the requirements, was valued as the best workman. The foreman will give a man a certain job to do, and will, perhaps, tell him how to do it, and he is expected to do it that way. The workman may suggest that the addition of such a thing would be a great advantage to him; but the chances are that he will be told, sharply, that the job has been done before without the aid of such things, and must be done again. I am quite satisfied that, in five shops out of every ten—ay, five out of six, it is not quality but quantity that is required; "rough and ready" is the word. The master urges the foreman for more work, and the foreman stirs up the men. Working under such influences as these, in a shop never unimpregnated with sulphur and smoke, sweltering in summer, half-frozen in winter, how is it possible, Mr. Editor, that men should take such an interest in their work as you and Mr. Ruskin wish? and, in many instances, at work from six in the morning until ten, eleven, and twelve at night. MOULDER.

WHAT BECAME OF THE PIGS?

To the Editor of the WORKING MAN.

SIR,—Having read the very interesting "Story of a Wood-Carver at St. Paul's," in your first number of the WORKING MAN, I feel, as no doubt many of your readers feel, that I should like to know what became of the carved sow and pigs, and if any trace of them now remains.

Yours respectfully, L.

4, Buckland Street, New North Road,
January 8, 1866.

TO CORRESPONDENTS.

THE BIRMINGHAM EXHIBITION.—We have received other letters disapproving the conduct of the Executive of the above Exhibition. The communication in No. 2 will, no doubt, suffice to draw forth some explanation of the matters referred to.

E. WILKINSON.—We are glad to hear that Messrs. Holmes, carriage manufacturers, of Derby, have kindly and unconditionally given their workmen the Saturday half-holiday.

G. S., who is constructing a model church with cork, desires to know what is the best material for joining the several pieces together. He has used sealing-wax, but does not like its appearance. A solution of shellac, white or brown, in methylated spirits of wine, of the consistence of cream, will answer the purpose as well as anything.

W. H. W. submits the following chemical query:—"The compound called aqua-regia is a mixture of nitric and hydrochloric acids. Some books say that it is merely a solution of chlorine (consequently its power of dissolving gold), and give its change thus:—'The hydrogen of the hydrochloric acid combines with the oxygen of the nitric acid, and the chlorine remains in solution.' Here is where I am puzzled. If that be the case, where does the nitrogen of the nitric acid go to?" The gold is attacked by the nascent chlorine. The nitrogen, with some oxygen in combination, passes off in a gaseous state.

THE ORIGINAL

Chlorodyne, invented by
RICHARD FREEMAN, Pharmaceutist.
Consumption, Bronchitis, Coughs, Colds, Whooping-Cough, Asthma, Cholera, Dysentery, Diarrhœa, Spasms, Neuralgia, immediately relieved, and most cases cured, by FREEMAN'S ORIGINAL CHLORODYNE.
It is largely employed in hospital and private practice by the highest Members of the Medical Profession as a remedy of intrinsic value in the above diseases. In tropical climates it is used, par excellence, as the remedy in Cholera, Diarrhœa, and Dysentery.
The Right Hon. Earl Russell graciously transmitted to Mr. R. Freeman, the Inventor of Chlorodyne, the following extract of a despatch from Acting-Consul Webb, dated Manilla, September 17, 1864:—"The remedy most efficacious in its effects (in Epidemic Cholera) is found to be Chlorodyne, and with a small quantity given to me by Dr. Burke I have saved several lives."
Numerous Testimonials from the most eminent Members of the Medical Profession enclosed with each Bottle.
Manufactured by the Inventor, RICHARD FREEMAN, 70, Kennington Park Road, London, S.
Sold in Bottles, ½oz., 1s. 1½d.; and 1½oz., 2s. 9d. each, by all Chemists.
CAUTION.—Beware of Spurious and Deceptive Imitations. The genuine has engraved on the Government Stamp, outside each bottle,
"FREEMAN'S ORIGINAL CHLORODYNE."
Be not persuaded to buy any Substitute. [5

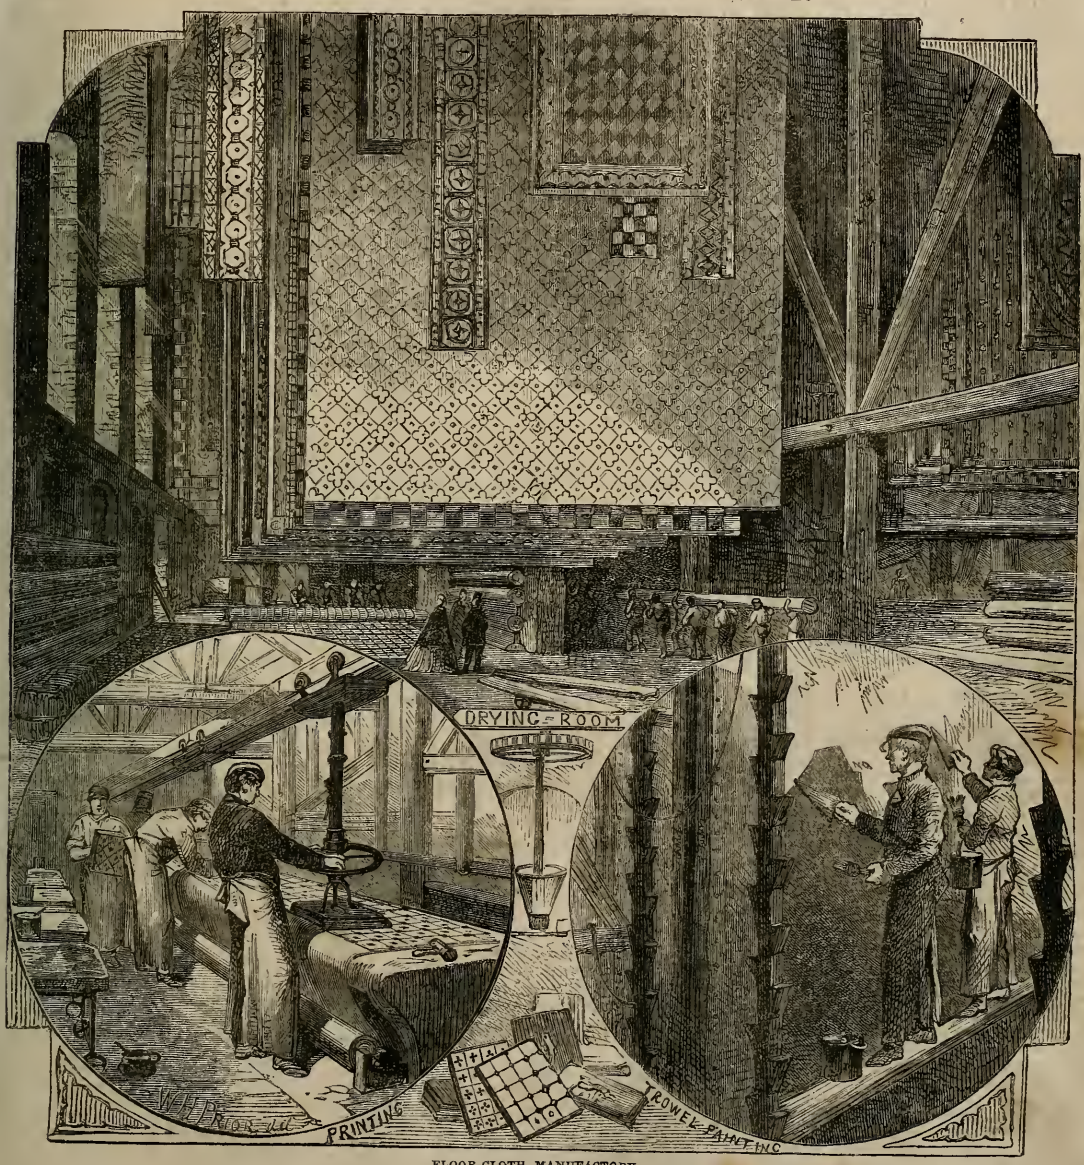
THE WORKSHOPS OF THE WORLD.



FLOOR-CLOTH MANUFACTORY.

Floor-Cloth Manufacture.

THE floor-cloth manufacture is a branch of industry almost exclusively English in its origin and development. Like that of carpets, it is of comparatively recent growth, and has now become a very large branch of trade. The quantity exported annually to foreign countries amounts to nearly half a million square yards, and is constantly increasing under the facilities afforded by free trade.

In most civilised countries, carpeting and matting of various kinds supply the place in household appliances which floor-cloth occupies in this country; but as this fabric becomes better known, its peculiar qualities, which render it more economical and useful, will doubtless cause it in due time to supersede most of the other fabrics which are now substituted for it.

Floor-cloth—or, as it is sometimes called, oil-

cloth—is a stout kind of canvas, painted on both sides in oil-colour. The canvas is a special manufacture, carried on principally at Dundee, in Scotland. The looms for weaving it are specially contrived for that purpose, as a floor-cloth, whatever be its size, must have no seam. The material is chiefly flax. The canvas or *cloth* has about sixteen or eighteen threads to the inch, and weighs about twenty-one ounces to the square yard.

A floor-cloth manufactory must necessarily be lofty, and occupy a large space of ground. One of the most eminent is that of Messrs. Smith and Baber, at Knightsbridge, London. The processes carried on at that establishment form the subject of our present description.

The canvas is shipped from Dundee in bales weighing about five cwt. each; these, upon their arrival at the factory, are unpacked, and spread out evenly upon the floor of the drying-room, and afterwards wound upon a wooden roller of about five inches in diameter, and rather longer than the width of the canvas. The roller and canvas are then conveyed to the frame room, and placed in position on the frame to which the canvas is to be fastened. This frame is constructed of stout oaken beams, and so contrived as to admit of the canvas being stretched upon it perfectly even. The arrangements adopted for this purpose are simple and ingenious. This stretching or framing of the canvas is, perhaps, the most delicate and important part of the series of operations.

The first operation to which the canvas is submitted is the *priming*. A weak solution of glue or *size* is applied with a brush to the back of the canvas, which, while still wet, is rubbed with a flat piece of pumice-stone, to smoothe down any asperities the surface of the canvas may present. The object of this "priming" is to prevent the paint from penetrating too deeply into the canvas, which would cause the floor-cloth to be brittle, and not sufficiently pliable.

Painting floor-cloth is very similar to house-painting. The materials and tools are the same, with the addition of a *trowel*, with which the paint, too thick to be worked with a brush, is spread evenly over the surface of the canvas. The canvas is painted on both sides, but less paint is applied to the back than to the upper surface, and no pattern is imprinted on it. As *driers* are not mixed with the paint, it takes a long time to dry—as much as ten days or a fortnight. The first application of the paint more resembles plastering than painting. Taking in his left hand a strong thick brush charged with paint, the workman daubs it on to the canvas in patches, and then, with the trowel, held in his right hand (see engraving), he spreads the paint evenly over the surface, contriving to work it into the interstices of the canvas, and thus to produce a tolerably even surface.

While the paint on the back is drying, the face of the canvas undergoes a preliminary preparation. The surface is covered with weak size, and rubbed down with pumice-stone, so as to render the canvas smooth, and fit to receive the paint. It is then left until the back is finished. When the first coating of paint applied to the back is dry, a second is laid on in thinner paint with a brush, and this finishes the back.

The *face* of the canvas now receives an application of "trowel colour," similar to that which was applied to the back, and is then allowed to dry. The unevennesses of surface are smoothed down with pumice-stone, then a second and a third coating of trowel colour are applied, and the pumicing repeated when each coating has become dry, after which the canvas receives a "brush colour." These several operations extend over a period varying from eight to twelve weeks, and the greatest care is taken that they are well performed, so as to secure smoothness of surface and pliability to the floor-cloth.

The next operation is that of printing the pattern, which by most persons will be regarded as possessing the greatest interest. During the previous preparations the canvas has been maintained in a vertical position; it is now laid horizontally on a long table. The method of printing is not stencilling, as is generally supposed, but block printing, as many blocks being employed as there are colours. The blocks are all exactly the same size, about fifteen inches square, and rectangular. They are formed of two thicknesses of pine wood, and one of pear tree, joined together so that the grain of one crosses that of the adjoining one, to prevent distortion.

A pattern may consist of any number of colours, but seldom more than ten or twelve are applied. Of course, the greater the number of colours the more complicated and difficult the printing, and the more expensive the floor-cloth becomes.

The cutting of the pattern on the blocks is a work of great nicety, for unless perfect register be secured the design will be distorted. The cutting is similar to that adopted in ordinary wood engraving, the design being formed in the flat surface of the block, while the white or blank portions are cut away. Sometimes the pattern is formed of copper, fastened on to the surface of the blocks. The pattern must not be left flat or smooth on the surface, else it would not take up or deliver the paint equally. The wood or copper is divided and broken up into ridges, which form the pattern in spots, as may be seen upon closely examining a piece of floor-cloth.

In the printing process each colour is spread out on a flannel pad or cushion, measuring about three feet by two and a half feet. The workman dips a brush in the proper colour, and lays a good supply of it upon the cushion; a printer then takes up one of the blocks and dabs it down on the cushion, when a proper supply of paint adheres to the pattern on the block, which he then applies to the prepared canvas lying spread out upon the table; then, with a heavy hammer, he drives the block down close upon the canvas, to which the paint becomes transferred. An improvement upon this method has, however, been introduced of late years, by which the pressure on the block is given by a travelling screw-press (see engraving), which relieves the workman of much labour, and performs the work more effectually and neatly.

The pattern-block, carefully registered, is carried over the whole surface of the canvas, until the printing with this colour is completed. The other colours are applied in a similar manner when the first is dry. The floor-cloth is then taken to the drying-room, where it is hung until fit for sale, which is not until after the lapse of six months or more.

The uses to which floor-cloth is applied are numerous. The English housewife has a horror of the sight of bare boards, and conceals them with carpeting or oilcloth; the latter is especially prized as a covering to brick and stone floors, as it serves as a protection against damp and cold. In France we find the floors of rooms of wood highly polished with beeswax, so that the surface becomes as slippery as ice, upon which it is scarcely possible for a person unaccustomed to it to walk without falling. To English taste this has a chilly, comfortless appearance. In the United States the use of floor-cloth has greatly extended of late years; it is now manufactured there on a large scale, and is gradually superseding the Indian matting, once so extensively employed there for covering the floors of kitchens, dining-rooms, &c. Floor-cloth is employed for other purposes besides carpeting—among others, as a covering for roofs, for which, being waterproof and very durable, it is well adapted.

The Working Men's Clubs and Institutes Movement.

THEIR ORIGIN AND PROGRESS.

BY THE REV. H. SOLLY.

HAVING been asked by the Editor to give a sketch, in the columns of the WORKING MAN, of the rise and progress of the present movement to promote Working Men's Clubs and Institutes, with a special description of the society called the Working Men's Club and Institute Union, I have prepared the following statement:—

The first Working Men's Institute appears to have been established by the Rev. F. W. Robertson, late incumbent of Trinity Chapel, in the year 1849; and several other places, from Cheltenham, in the south-west of England, to South Shields, in the north-east, followed the example. These institutions were endeavours to establish Mechanics' Institutes, or Literary and Scientific Institutions, under a name which would be some guarantee for the committee and members being chiefly, if not entirely, working men. But the objects were the same—viz., to secure reading-rooms, library, lectures, and classes.

In 1854 there appears to have been something more like a Social Club than any of these institutes opened in the Colonnade, Clare Market, London; but its history and nature are rather obscure. In 1858, however, an unmistakable combination of Social Club and Mechanics' Institute was established by the Rev. E. Boteler Chalmer, incumbent of St. Matthias, Salford, Manchester, in his parish, which has done a vast deal of good, and flourishes to this day. In the following year, Mrs. Bayly, authoress of "Ragged Homes, and How to Mend Them," perceiving the great wants of working men from frequent intercourse, first, with their wives, and then with themselves, opened a Workmen's Hall (which was essentially a Social Club), in Notting Hill, London. In 1860 Miss Adeline Cooper, from similar experience, established a Working Men's Club in Duck Lane, Westminster. These three last enterprises were all undertaken with little or no acquaintance on the part of the promoters with what had been done elsewhere. In like manner, from long and intimate intercourse with the working classes in various parts of England, the writer of the present article, about the same time, was coming to a conviction that a much larger amount of recreation and provision for social intercourse than Mechanics' Institutes afforded was required to meet the wants of working men, and to render them independent of the public-house. He was accordingly engaged, during 1859 and 1860, in promoting measures for these purposes in Lancaster. While conversing in the summer of 1861, with the Rev. Mr. (now Dr.) Thomas, of Brixton, on the subject, that gentleman, who had been earnestly looking in the same direction, proposed the formation of a national organisation, in the shape of a limited liability company for building Working Men's Clubs and Institutes all over the country. The writer saw with thankfulness that such an organisation, if only it were made a philanthropic society, instead of a commercial company, was the very thing required, and Mr. Thomas consenting to the change, they set to work at once to draw up a prospectus, and form the society. The invaluable support and sanction of Lord Brougham was obtained as President of the Union. Various other eminent men were successively induced to become vice-presidents, and the annual meeting of the Social Science Association held in London during the summer of 1862, afforded the means of making known the new organisation under favourable circumstances. Lord Brougham presided at a meeting for its inauguration, held at the Law Amendment Society's rooms, in Waterloo Place, on June 14, 1862, and in the following autumn rooms were taken at 150, Strand, for the office of the Union. The writer resigned the pulpit of the English Presbyterian chapel in Lancaster, to become its secretary, and its labours were fairly commenced in October of that year. Its principles and objects were thus set forth in the society's prospectus:—

"This Union is formed for the purpose of helping working men to establish Clubs and Institutes, where they can meet for conversation, business, and mental improvement, with the means of recreation and refreshment, without being dependent for these purposes upon the public-house; the Clubs, at the same time, constituting Societies for mutual helpfulness in various ways.

* * * * *

"The Council seek to carry out the objects of the Union:—

"1. By correspondence with the officers of existing Associations throughout the kingdom.

"2. By personal visits from their own officers and honorary deputations to such places as may seem to require to be visited. At these visits conferences are frequently held with the gentry, the working men, and generally with persons in the locality who may be interested in the movement.

"3. By the dissemination of pamphlets, or special papers, on subjects lying within the sphere of the Society's operations, in addition to communications to the daily and weekly press.

"4. By supplying instructions for the guidance of persons who may wish to establish Clubs or Institutes; together with rules to define their objects, and to regulate their proceedings.

"5. By grants or loans of books for Club libraries, apparatus, diagrams, &c., to Societies in membership with the Union, in cases where local circumstances may seem to call for such aid."

From October, 1862, to the present time, the society has been pursuing its course with in-

creasing support from the public, and it is to be hoped with considerable benefit to the working classes as well as to the country at large. It has been instrumental in establishing about 130 clubs in various towns and villages in England; while the papers read by the secretary at the Social Science Association's meeting at Edinburgh, in October, 1863, and the various publications of the society, as well as the attention which its labours have drawn to the subject throughout the kingdom, have led to the establishment of these clubs during the last year and a half in most of the principal towns of Scotland. From the same cause, and under the same guidance, they are springing up in Tasmania, Sydney, and Victoria in South Australia, while great interest in the movement has been expressed, and the Society's publications have been taken, by distinguished philanthropists and social reformers in Italy, Germany, Hungary, and the United States of America. The work is also going on with great rapidity and success, under the necessary modifications, in a large number of soldiers' barracks in various places at home and abroad.

A word may now be said as to the principle and plans which experience has shown to be best adapted to meet the wants and promote the welfare of working men by means of these Clubs and Institutes.

Until within the last few years, by the word "Club," working men have generally understood a Benefit, Sick, or Provident Society. The upper classes of society, on the other hand, have used it as the name of societies for social intercourse and convivial meetings. A combination of this latter idea, with the mutually helpful spirit of the former societies, best expresses the general purpose for which the name "Working Men's Clubs" has been used in this movement; while the name "Institute" is added, in many cases, to show that something of an educational character is also intended by its promoters.

But the *main primary* feature of the club was to be social intercourse and recreation. When the persons named above, and many others, were considering the privations and wants, the vices and temptations of working men, they saw the insuperable obstacles in the way of working men obtaining that social enjoyment at their own homes; they saw, moreover, that nine-tenths of the frequenters of public-houses were kept, if not drawn, there by the company they found in them, rather than by the drink. It was thought to be right and good for all men to enjoy cheerful companionship, that it was not possible for working men to visit one another, as the upper classes do; and that if they could have the means of pleasant intercourse and recreation without being obliged to pay for it by drinking, they would gladly exchange the old, extravagant, and demoralising plan for the one adopted years ago by gentlemen—that, in short, they would hail with thankfulness the establishment of Working Men's Social Clubs for company and amusement, free from the temptation or obligation to drink.

The working classes in various parts of England were therefore invited, by means of public meetings and the circulation of explanatory papers, to form themselves into societies or social clubs wherever a few of the upper class were found willing to guarantee the rent of premises, purchase or erect a suitable building, to provide furniture, fittings, and books, or otherwise to help the working men to do what they were unable to do for themselves. The first thing, generally, was to get a provisional committee, then to enrol members, agree to rules, choose officers, &c. The rooms required were, first, a good-sized room (the largest in the house), for conversation and refreshment, where men could meet their companions, have a cup of coffee, smoke their pipe round the fire if they wished it, look at a newspaper, and where, on a Saturday night, they could have a "free-and-easy," or other entertainment. Secondly, a smaller room, where those could read who wished it, where the library should be kept, where quiet games—such as chess and draughts—might be played, but where neither talking nor smoking should be allowed. Thirdly, a room for other kinds of recreation, such as bagatelle, or a skittle alley and quoit ground, in a back yard. Fourthly, a room for classes, in case any of the members wished to supply deficiencies in early education, where a discussion meeting could be held one night in the week, and an elocution, singing, history, French, or political and social economy class might be held on other evenings; also for the committee meetings. And fifthly, if possible, a room in which Friendly, Provident, and Labour Loan Societies, or Coal Clubs, &c., could hold their meetings, instead of being forced to have them at a public-house. The elocution and singing classes prepare members to entertain their mates at the "free-and-easy," Penny Readings, and other amusements; while the discussion class, if well conducted, is the best possible means for interesting thoughtful working men in the club, and for awakening the mental powers of those who have not been in the habit of either thinking or reading. The use of a large hall for occasional concerts, lectures, *conversazioni*, &c., to which members may bring their wives and daughters, is of great value, almost indispensable.

So much as to the plans adopted.

The general principles that have guided the promoters of Working Men's Clubs and Institutes are—1st. That working men should be led to do as much as possible for the undertaking themselves; to give as much, both in time and money, as it is right to afford; that they must be made to feel responsible for the good management and success of the society, and, therefore, be brought to feel that it is *their* club, and that they are their own masters there; that we have to help, but not to govern them—to *supplement*, in short, their efforts, not to *supersede* them. 2nd. That the clubs must be made places for cheerful social conversation and amusement, combined with opportunities for mental improvement, if they be desired. 3rd. That they must be made *societies* for mutual benefit and brotherhood, not merely *places of resort*, so that all may endeavour to promote the common good and general enjoyment. 4th. That they must be made, on the one hand, a refuge, for those who need it, from the temptations of the public-house, by excluding drinking, betting, and gambling; and, on the other, the means of improvement and elevation for those who seek, or will accept, such benefits, by giving a common meeting-ground in a sociable way, for working men and persons of higher culture and larger information—opportunities, in fact, to interchange ideas, either by chatting round the fire, or, in more systematic form, in the class and lecture-room.

The next question is, How far have these plans and principles succeeded in practice? The answer will be found in the case of about 180 clubs and institutes that have done, and are doing, an invaluable amount of good; of about fifty that are, at present, in a languishing or doubtful condition; and of eighteen that have been actually closed during the last two years. A glance, however, at some of these, with a brief consideration of the chief causes of their success or failure, must be reserved for another number of this Journal.

Heywood Working Men's Industrial Exhibition.

It is curious to note how frequently the successful formation of a Working Men's Club is immediately followed by an attempt on the part of the members to establish a Working Men's Industrial Exhibition. *Why* it should be so is a question which may be answered by us in a future article; but that it *is* so is a fact which admits of no doubt whatever. At least three-fifths of the Working Class Industrial Exhibitions hitherto held owe their origin, directly or indirectly, to the progress of the Working Men's Club movement, from which so many other equally interesting and important results have already sprung. At Preston, Manchester, Nottingham, Wandsworth, and elsewhere, the Industrial Exhibitions were organised and established through the exertions of the members of the Workmen's Clubs in those localities, the latest instance being that of Heywood, where an Industrial Exhibition has recently been opened by the friends and members belonging to one of the most important Working Class Clubs yet formed in this country. Lancashire and Yorkshire are the districts *par excellence* of Industrial Clubs and associations, and this is not the first time that the men of the cotton metropolis have proved themselves true to the reputation obtained by their brother toilers of the north. In Salford was formed what may be regarded as the oldest Working Men's Club yet existing; and in Heywood was established that to which we are about to allude. This latter is held in some convenient premises, situate near the Heywood Mechanics' Institute, Bamford Road, and comprising a light and well-ventilated reading-room, plentifully supplied with newspapers and periodicals of every class, together with a few books, which it is hoped will form the nucleus of a future library; a smoking-room, where dominoes, chess, and draughts are provided for the use of the frequenters, young persons not being admitted; a similar apartment for general use; a billiard-room, fitted up with two tables; and a club-room, for the use of Friendly Societies, and others desirous of ceasing to hold their meetings at the public-house. Two Friendly Associations have already availed themselves of the privilege. The number of members at present belonging to the club, which was only opened three months ago, is 320, and it is encouraging to find that with the majority of these the reading-room is more in favour than is the smoking-room or the billiard-room.

This is the institution to which the Heywood Working Men's Industrial Exhibition may look as the principal author of its existence. The Club and the Exhibition were organised by a few persevering individuals; and on New Year's Day the latter was formally opened, in the large room belonging to the Co-operative Society's Stores, situate in the Bamford Road. There was no great flourish of trumpets on the occasion; no M.P.'s adorned the platform, or lent lustre to the chair; no dignitaries, with a multitude of great staring initials at the ends of their names, came to gape and be gaped at. There was nothing of all this. The opening ceremony was presided over by a local clergyman—the rector of St. Luke's, Heywood—another minister reading the report of the committee. But the men who had helped to form the Exhibition, and the men for whose delectation it was intended, *they* were there—there was no mistake about *that*. They spread themselves over the room, criticising and examining the different objects which arrested their attention, and showing that they were determined, like sensible men that they were, to thoroughly enjoy themselves. There were plenty of things for them to look at: oil-paintings by a warper; a picture by a policeman, showing the evils of intemperance; a painting by a working shoemaker; mechanical drawings by skilled artisans; and a large number of other working-class productions, crowded the walls, which were likewise decorated with valuable paintings, photographs, and drawings, kindly lent by various gentlemen who had manifested considerable interest in the Exhibition. The articles which covered the counters and stands were of the character usually found at such Exhibitions, the number of curiosities being, however, somewhat large. There was a wonderful bed-quilt, made by Drummer Charles Richards, of Her Majesty's 80th Regiment, during his leisure hours while serving in the East Indies, the time occupied in making it being nine months, and the number of pieces 17,250. Lying upon it was an Indian waistcoat, of a very beautiful manufacture, made by a native Indian woman. There was likewise a model of a steam-ship, made by two young men, one of whom has only one arm; two small Jacquard looms, one of which was said to be the smallest Jacquard in the world, and, as such, obtained the first prize at the Paris Exhibition; a small brass double high-pressure engine, a beautiful piece of workmanship, made by a mechanic; a one-horse engine, made by two youths, one of whom was sixteen, and the other a little over twenty years of age; an ingenious toasting-fork, by which the bread was moved any distance from the fire, turned round, and taken off without removing the apparatus from its fixed position, the latter being made to fit any kind of grate; an ingeniously contrived apple-parer; and many articles of a similar nature.

Besides these, there were numerous models of buildings, curious carvings, specimens of needle-work, antiquities, microscopes, statuettes, stuffed birds, ancient coins, and other things, as the catalogues say, "too numerous to mention." Altogether, the Exhibition was one which reflected the highest credit on its promoters, who had many difficulties to contend with before their hopes appeared to have even the faintest chance of success; and we trust that when the financial report comes to be prepared, it will be found that there is a handsome balance standing to the credit of the Heywood Working Men's Club and Institute.

Art and Handicraft.

IV.—THE PRIMARY WANTS OF THE PUBLIC AS *THE NATIONAL CONSUMER.*

ARTISTIC intelligence in the demand of the public would inevitably ensure, in due course, a supply of objects suited to meet that demand. So long as the manufacturer or the shopkeeper can plead that the public only asks for and seeks the showy and meretricious, or the ponderous and the ugly, as a matter of course, neither will think it worth while to do anything to change the character of that demand; or, at least, such efforts will be very exceptional. It is, then, after all, in the education of the general public, as the natural consumer, that the solution of the problem rests: whether the union of art and handicraft is to be of such a character as to produce a really artistic result.

One thing, however, must be steadily kept in view, as it has been too frequently overlooked, or ignored altogether: this is, the fact that the manufacturer and the workman engaged in one description of art manufacture are the consumers in other departments of production. Thus, if the art knowledge and taste which they bring to bear upon their own productions be based upon true and intelligible principles, these will, when applied to their wants as consumers, ensure an intelligent demand. The art-workman, whose knowledge of drawing and the elementary principles of design enables him to produce artistic works in metal or carved wood, is a very unlikely person, if his means permit, to buy—by choice, at least—ugly earthenware, or badly-decorated japanware; or if he is compelled to buy it because his purse is scanty, or because the shopkeeper cannot obtain or will not keep for sale such articles as come up to his standard, he will, at least, take his revenge by a sharp and intelligent criticism upon his purchase, and hope for better things next time he goes to market. At all events, he does not *believe* that to be beautiful and elegant which he *knows* to be ugly and clumsy. This, alone, is a great step.

But, outside of this class of producers, there is a very large and overwhelming majority whose pursuits, or lack of all pursuit, prevents the possibility of any such knowledge being obtained, except by a process of direct instruction. If this instruction is to come as a direct and distinct branch of education, the study of drawing becomes absolutely necessary; and it must rest with the judicious master what difference he will make in the course of instruction suitable for professional purposes, to adapt it to the general public. One thing, however, is quite certain—that, to appreciate form and colour, composition and light and shadow, the combinations of varied details as a means to the making up of a complete and perfectly harmonious result as *the end*, pretty much the same course will be necessary as with the artist workman; since it must be quite clear that he who judges and he who does the work ought to stand upon, as nearly as possible, the same base line, in order to fairly understand each other.

Beyond, and often far wide of the class who care to study art as a necessary portion of modern education, there lies, probably, a much larger number of persons who have neither time—or, at least, fancy they have not—and certainly have no inclination to study the question of art in any form. Happily, this class is largely, if not entirely influenced by those around them, whom they, out of sheer laziness, are willing to believe know all about "that sort of thing." It is this class that the shopkeeper, as an arbiter of public taste, depends upon to *buy* what he makes up his mind *shall sell*. If, however, the educated portion of the public desire to see the national taste purified and advanced to a higher position, they will take care to influence this negative class by every means in their power. But to do this, they must be quite clear why certain things are bad and ugly, and why other things of the same technical class are in good taste and beautiful; and these facts they must impress on the minds of their friends who say they "don't pretend to have taste;" and also the shopkeeper, who *does* pretend to have taste, and who, in many instances, is as far off it as the most indifferent of his customers.

An illustration of the value of a principle in selecting and buying a special object may be useful. A carpet has to be purchased. The seller of carpets brings out his most striking patterns alike in form and colour. The proposed purchaser, having a very decided opinion as to what it is he wants, and intends, if possible, to get, reminds the dealer that he wants a covering for a floor; that the floor is flat, as it is used to walk upon; and that, as the carpet is not to be the only decorative object in the room, he decidedly objects to very brilliant colours, whilst, as he has no wish to suggest to his friends either stumbling-blocks or pitfalls in his floor, he thinks the objects depicted in such high relief, and with such terrible truth in foreshortening, quite out of place. The aspect of the room as regards light, the use to which the room is devoted, are considerations which can be entered into in due course, if the primary conditions are fulfilled—that, as the carpet is to cover a flat surface to be walked upon, and upon which, too, other decorative objects are to be placed, therefore it should be consistent in its ornamentation with these requirements.

It is the persistence of a certain class of persons, when buying their carpets, in absolutely "dinning" these arguments into the ears of the shopkeeper which has, at length, rendered it possible to get carpets which will meet the conditions named; and the principle applies to every other decorative object with which we clothe or adorn our persons, or furnish and decorate our houses.

Tables must be made to *sit* at, *eat* off, and in some cases *work* at. Chairs must be made to *sit in*, and not merely to *look at*. These illustrate *primary* requirements which a little common sense will enable any person to apply in their own way. The elaboration of the principles which ought to guide the design, execution, and selection of the whole circle of decorated manufactures will form the subject of subsequent articles.

GEORGE WALLIS.

THE WORK SHALL FILL THE MILLS AGAIN.

A SONG OF HOPE.

WRITTEN DURING THE DISTRESS IN LANCASHIRE.

THOUGH all is dark and dreary now,
And thousands dread the morrow,
While Labour's pale and care-worn brow
Is clouded o'er with sorrow—
Though in the cellars damp and lone
Our famish'd ones are pining,
And, with a sad, despairing moan,
Each dream of joy resigning—
Yet work shall fill the mills again,
And fact'ry bells be ringing;
From every court, and street, and lane,
The anxious toilers bringing.

Though vainly for their daily bread
The workers aye are sighing,
Or wish that with the silent dead,
Their aching forms were lying;
Yet Peace, with sunny smile, shall come
And bid each toiler treasure
The infant darlings of his home,
And sing aloud with pleasure:
While work shall fill the mills again,
And fact'ry bells be ringing;
From every court, and street, and lane,
The anxious toilers bringing.

Each soul that wears the thorny crown
Of earthly pain and trial,
Shall kneel no more in anguish down
'Neath Famine's grim denial;
But, purified, shall proudly rise
Above each old endeavour,
And learn the right to love and prize,
And from the wrong to sever:
When work shall fill the mills again,
And fact'ry bells be ringing;
From every street, and court, and lane,
The anxious toilers bringing.

No more shall passions fierce and strong
In lowly hearts be burning;
No more shall thoughts of evil throng
To dim each nobler yearning;
Nor class in hatred war with class,
E'er seeking vengeance blindly,
But strive each other to surpass
In deeds and actions kindly,
When work shall fill the mills again,
And fact'ry bells be ringing;
From every street, and court, and lane,
The anxious toilers bringing.

JOHN PLUMMER.

*Apprenticeship: its Rights and its Duties.**

IN our last number we explained the origin and nature of apprenticeship, with the duties it involves on the part both of the apprentice and the master. We now proceed to give an outline of the general law on the subject.

The common law of England does not recognise the power of an infant, or person under twenty-one years of age, to enter into a contract for any other purpose than his own benefit and advantage. But in apprenticeship, as we explained in our previous paper, the benefit is *mutual;* the apprentice learns a trade, and the person who teaches him has the advantage of his services during a certain time. As the master has no remedy at common law against the infant for breach of his part of the contract, it is customary for some relation or friend of the apprentice to join in the agreement, and to undertake on his behalf that the contract shall be faithfully performed. This rule, however, does not apply in the case of apprentices bound to freemen of the City of London; for long custom is held to have established there, that any person unmarried and above the age of fourteen who may bind himself apprentice, shall be answerable to the master for the performance of the contract in all respects, as if he were of full age when the agreement was made.

No agreement of apprenticeship is valid unless the apprentice has expressly signified his consent to the contract. It has been decided at law that in the case of a father who had bound his son, the parent and the master only signing the indentures, the latter were void.

The formal execution of indentures is essential to the validity of an apprenticeship agreement. No verbal understanding or simple agreement in writing is sufficient. And where any sum of money is paid by the one party as a condition of the contract, that sum must be correctly specified in the indentures, or they are invalid.

The master who takes an apprentice, although bound to fit him for practising his art or trade, is not compelled to teach him in his own person: he may hand him over for instruction to other persons in his employ, and even to other apprentices; all that he is engaged to do is to give the apprentice fair means of becoming proficient in the business. And where the apprentice is placed under the instruction of a foreman or other proper person, he is bound to defer to the authority of that person, as if he were the master himself.

The law does not recognise that the apprentice is in the position of a servant to the master, to do anything more than properly comes within the range of the trade or occupation specified in the indentures. Here is a frequent source of complaint and misunderstanding, especially on the part of apprentices engaged to employers in a small way of business. They find, in many cases, a multiplicity of services put upon them, and feel aggrieved when those services extend beyond the proper scope of the trade. But much of the disagreement that arises on this point, and which often proceeds to a very unpleasant length, would be avoided, if only there existed a right feeling between the apprentice and the master, and a sense of how much mutual consideration would promote their mutual interest and comfort. On the part of the apprentice, although he is not bound to do anything not included in the business itself, yet it would display a disobliging and even churlish spirit to refuse any reasonable service or assistance of which the master might stand in need. On the other hand, the master has no right to look upon his apprentice as a person placed at his disposal for any and every kind of work—to exact from him unreasonable services, and make him a general drudge.

In the event of serious disagreement between master and apprentice, either party has the right—dating as far back as an unrepealed enactment of the 5th Elizabeth, cap. 4—to apply to the magistrates in sessions, who may, on proper cause shown, punish or even discharge the apprentice; while, on the other hand, they may fine the master for his faults, or liberate the apprentice from the remainder of his service. In

* Continued from page 35.

the case of parish apprentices, two justices are empowered with equal authority by the Act 20 George II. In London, either party may summon the other before the Chamberlain of the City, who has the same powers as the magistrates in other cases. A freeman of London may turn away an apprentice for "gaming." By the Scotch law, a master may dismiss an apprentice who is "incorrigible."

The master is bound to provide his in-door apprentice with food, clothing, and necessary attendance in sickness. In the case of his refusing or neglecting to do so, he is declared guilty of misdemeanor, and may be punished by imprisonment. And where the master has covenanted to pay his out-door apprentice a weekly wage, he is not released from that payment by the incapacity of the apprentice to serve him, through accident or ill health. Nor can the master stop the wages of his apprentice for accidental damage to his property, unless he is allowed to do so by express covenant in the indenture.

A master is liable to imprisonment for assaulting his apprentice in a manner calculated to inflict permanent injury; but he is allowed by law to inflict moderate chastisement on the apprentice for decided misbehaviour.

Any apprentice whose premium does not exceed £10, if he should run away from his master, may be compelled to serve a proportionate time beyond the proper expiry of the agreement, or to make satisfaction for the loss sustained by his absence. A refusal to do either renders him liable to three months' imprisonment. In the case of his entering the service of another person during the time he may have absented himself, the master is entitled to all his earnings; and, if he should have been enticed away, may bring an action for damages against the person who misled him.

An apprentice who is bound to two or more masters, on the death of one of them, remains equally the apprentice of the survivor or survivors. He who is apprenticed to one master only, is not released from his apprenticeship by that master's death. The executors may apprentice him to another master for the remainder of his term; but they are also liable for the maintenance of the apprentice, as far as the assets in their hands will allow. The custom in the city of London is, that if the master die, the apprentice must continue the service with the widow, if she carry on the trade, otherwise the executor must put the apprentice to another master.

The master is at liberty, by the custom of London and some other places, to assign or "turn over" his apprentice to another master. This cannot legally be done, however, in any town or other place where it is not the established custom. Parish apprentices may be "turned over," with the consent of two justices of the peace.

The bankruptcy of a master operates as a complete discharge of the apprentice's indenture; and where an apprentice may have paid a premium for learning the business, the court may order such a sum to be repaid out of the estate as the circumstances of the case will allow, or may seem to require. Finally, an indenture may be determined or put an end to at any time, by the consent of all the parties to it.

Before concluding this outline of the law, we must add, that an apprentice cannot be compelled to work at his trade on the Sunday, nor to attend on that day at his master's place of business, unless in special emergencies. The Act of Parliament 29 Charles II. enacts that "no tradesman, artificer, workman, labourer, or other person whatsoever, shall do or exercise any worldly labour, business, or work, of their ordinary callings, upon the Lord's day, or any part thereof, works of necessity and charity only excepted." Under this act, it has been decided by the House of Lords, on appeal, that a barber's apprentice, who was bound by his indentures "not to absent himself from his master's business, holiday or week-day, without leave," could not be lawfully required to attend at his master's shop on Sunday mornings.

SUNDAY POSTAL DELIVERY.—It has been suggested that the postal authorities should insert a rule into their "Postal Guide," to the effect that no letters will be delivered on Sundays, unless the words "For Sunday's Delivery" are written on the outside, so that those letters which are of such importance as to necessitate their delivery on Sunday would be delivered on that day.

Art Designs

FOR USE IN TRADES AND MANUFACTURES.

MARQUETRY-WORK.

MARQUETRY-WORK consists of thin and carefully-selected pieces of wood, tortoise-shell, pearl, or other substances, arranged upon a wooden ground so as to form a species of ornamentation. The work intended to be thus ornamented is generally of wood, which must be of a fine grain, and free from knots. If the ground be of a light colour, the marquetry generally consists of dark-coloured woods, such as ebony, mahogany, or rosewood. Metal is frequently introduced, and when employed upon an appropriately coloured ground is not ineffective. During the last century, marquetry-work was more commonly practised than at the present time, many of the marquetry-workers, especially in France and Italy, attaining a marvellous degree of proficiency in the art. The two designs furnished by us this week belong to the period of Louis XIII. They represent the fronts of drawers belonging to a cabinet. The first design is executed in tortoise-shell of two colours; in the second, the design is of copper, upon a groundwork of tortoise-shell. It should be noticed, that the keyhole in the second design is artistically made to form a portion of the ornamentation itself, thus showing how the true artist is enabled to utilise and convert into an embellishment what would otherwise be a disfigurement.

SCHOOLS OF ART.

RECENTLY, in distributing some prizes at the Carlisle School of Art, Mr. Edmund Potter, M.P., commented upon the policy at present pursued by the Department of Science and Art. He said the recommendations of the committee of the House of Commons, of which he was a member, were that there should be capitation grants for schools for the artisan class, that the system of making building grants should be abandoned, and that the accounts of the grants to South Kensington should be more clearly made out. South Kensington, however, declined to carry out the first two proposals of the committee; and, curiously enough, in the first report after this there were no accounts whatever published—the first time they had been omitted for ten or fifteen years. He remonstrated with Mr. Bruce; but meanwhile Parliament was sent to the country. The department having taking its own course, some of the committee felt rather annoyed, and their chairman, Sir S. Northcote, summoned some of the committee together. They did not know what to do, and a great many of them, having sat ten or fifteen days on the subject, were tired of it, and therefore concluded that the best plan would be to get the country schools to appeal to Lord Granville. A large deputation went up, and succeeded almost in getting what would probably have the effect of doubling the allowance to them. He thought there was no power of doing anything else. There was nothing now left but testing the thing, and relying more upon their own efforts than upon Government grants. Speaking of the unfairness of the system pursued at South Kensington, Mr. Potter said that the yearly grants to that museum were from £130,000 to £140,000, of which some £30,000 or £40,000 were spent in decoration, and a large sum in articles for the museum, the practical schools coming in for what was left. He did not wish to detract from the merits of South Kensington; its drawing school, perhaps, was the finest in the world, and they were indebted to it for a great many able masters, such as ten or fifteen years ago schools had great difficulty in obtaining; but till they got the educational grants separated from the amount expended on South Kensington, they should never get any satisfaction. What the department had done for art fell very far short of what was due to the country.

The entire number of students last year in all the ninety schools, was only 16,500; and when they considered that more than half of these were artisans, and that the department and the Government had been urging on artisan education for nearly twenty years, he thought that the result was most miserable. If the capitation system had been followed, he believed they should have had, instead of 8,000 or 9,000 artisans, some 30,000 or 40,000 in course of education. Country schools could not be self-supporting; they must either have Government aid or liberal subscriptions. Raising the rates had been suggested; but his own feeling was that they should be lessened, and that Government ought to support this class of education, otherwise it would not be carried on. Art education was not what it ought to be after being established twenty years; but their only course now was to work it out as best they could, and if in the course of a year or two they thought they were wronged, they had the means of redress, and he hoped advocates more powerful than himself would be found to alter the whole system.

Progress of Chemistry.

I.—ITS ORIGIN.

WE shall not say that "the origin of chemistry is lost in the night of ages"—a sonorous phrase, which teaches nothing—but we begin by proving that the initial data, the first materials of chemistry, long before the science had a name, existed in the workshops of the smith, the enameller, and the painter, and in the shops of the druggist and apothecary; in fact, in all the useful arts, cookery included. This shows that science is born of the wants of life.

The term chemistry dates only from the fourth or fifth century of our era. Its true signification is, *the art of dissolving*, or *melting*.

It is with science as it is with the life of a human being. The material elements exist before either is formed; but the living being receives a name, is described and classed, only when it has acquired the form that characterises it. So, also, science can be defined only when it is sufficiently developed to present, by the combination of its elements, a true body of doctrine.

Practice precedes theory. Behold those objects of human industry, drawn from the bowels of the earth, or ruins of ancient edifices. They testify to the high civilisation of these Eastern peoples who have long ago disappeared from the stage of the world. These enamels, dye-stuffs, coloured glasses, instruments formed of metallic alloys, all those artificial products preserved in cabinets and museums, were fabricated at a period when the west of Europe was still buried in the darkness of barbarism. Civilisation displaces itself; it follows the apparent motion of the sun.

History perpetuates the memory of those who have shed most human blood. It has not cherished the name of the mortal who invented *bread*—an invention that is far from being so simple as we might be tempted to suppose; for it was first necessary to find out the plants, the grasses which yield alimentary grain, and this was assuredly no easy task, for the natives of the New World, whence we first obtained the potato, knew nothing of corn before the arrival of Europeans. Then it was necessary to grind the grain, to separate the bran from the flour, and make that flour into dough. Then how did they happen to discover that a little piece of sour dough, of a most detestable taste, caused a mass of freshly-mixed dough to swell up, and that the dough thus prepared gave in cooking a light, savoury, wholesome bread?

The Greeks, whose imagination embellished everything, attributed the invention of wine to a god, and to a goddess that of bread. In Greco-Roman antiquity, Ceres and Bacchus were synonymous with *bread* and *wine*. It is, however, certain that the origin of bread and wine dates from the time when, according to mythologists, men had relations with the gods.

To squeeze a bunch of grapes in order to drink the juice is a very simple idea, which might occur to any one. But the fermented and preserved juice of the grape has a very different taste and flavour from that of grape-juice freshly expressed; and it certainly demanded some little courage to taste a spoiled, *corrupted* liquor—for fermentation of every kind is a *corruption*. Who first had that courage? On this head history is perfectly silent.

To adopt the fermented, corrupted juice of the grape may appear to us a very insignificant matter, a detail unworthy of the name of discovery, now that the human palate is familiar with the taste of wine, and it is so many ages ago!

There is, however, a similar detail, which causes us at the present day to bless the name of Parmentier. The potato was known in Europe more than a hundred years before this benefactor of the human race was born, but it was cultivated only in a small number of gardens; it was shown to the curious as a horticultural rarity. A few amateurs had, it is true, attempted to introduce it among our alimentary plants, but no one cared about it; its taste was compared to that of a rotten turnip. To triumph over this tyrannical, exclusive taste, it was necessary to familiarise the palate with it—to educate it, in fact. This need surprise no one, for our eyes and ears, to become sensitive to novelties, require an initiation—a true education. Objects before which the crowd passes with cold indifference, become marvels and wonders to the penetrating, cultivated eye of the observer. So, for the exotic tubercle to become adopted—which is now almost as indispensable to our tables as bread itself—nothing less was necessary than the perseverance of Parmentier, and the command of a king—of Louis XVI., who, at a court festival, wore a potato-blossom in the button-hole of his coat.

King or subject, he who was the first to cause the fermented juice of the grape to be adopted as a drink, had difficulties no less great to overcome. We mourn the slowness of moral progress. This slowness, as we have shown, is incidental to material progress also.

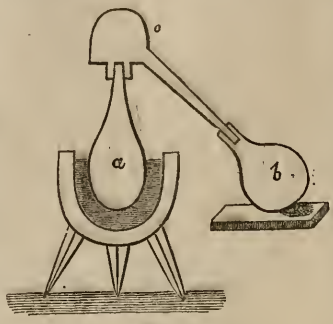

Fig. 1.

To judge by the history of *brandy*, this liquor was very slow in becoming adopted into domestic use. Brandy was first called—as it is to this day by the North American Indians—*fire water*; with turpentine, it entered into the composition of "Greek fire." Next, the properties of prolonging life and of healing disease were claimed for it, and the name of *eau de vie*, or water of life, was bestowed upon it. The Spaniards, in naming it *agua ardiente* (burning water), merely translated the Arabic word *alcool* (the burning) into their own language. Even so late as the fifteenth century brandy was sold only by apothecaries. But to "live long in the land" is a desire as natural to man as it is to amass money—we mean, of course, only such men as live but for the present, and those, unhappily, form the great majority. From the abuse now made of it, brandy should be called by quite another name; for to how many men has it been the cause of disease and death!

There is a reason for everything. Errors and abuses have more times than one been turned to the advantage of the progress of science. This remark applies particularly to alcohol—now called *spirits of wine*, because it is obtained principally by the distillation of the fermented juice of the grape. The abuse of spirits of wine stimulated the spirit of research. While some experimenters mixed brandy with aromatic essences, others improved the process of distillation; and others, again, undertook to extract spirits of wine from other substances besides fermented grape-juice.

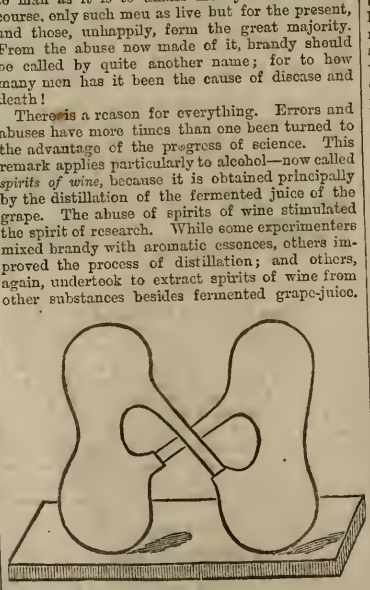

Fig. 2.

So with Malaga wine—in which is cinnamon, nutmegs, cloves, pepper, galenga root, zedoary, lavender flowers, sage, rose-leaves, &c.—they made *hypocrase*; and with this liquor distilled they prepared the *Emperor's brandy* (Francis II., in the thirteenth century). It was with this *Imperial water* that the brave knights fortified their stomachs (such stomachs!) before repairing to the tournament or battle-field.

Distillation must have been known long previous to the Middle Ages. Aristotle, the tutor of Alexander the Great, made allusion to it three centuries prior to the Christian era. "Sea water," said he, "is rendered drinkable by evaporation. Wine and other liquids can be submitted to the same process; after being reduced to vapour they become liquid again."

The idea of distillation may have been derived from attentive observation of what passes in nature. What is rain? Water that falls from the clouds. What is a cloud? The vapour of water, which, on account of its peculiar vesicular state, may be held suspended at variable heights in the atmosphere. Whence come the clouds? From the evaporation of vast sheets of water, particularly from the evaporation of the waters of the ocean, effected by the heat of the sun. Here, then, we have all the elements of a distilling apparatus. The ocean is the still—the reservoir of the liquid to be distilled; the atmosphere is the pipe which is adapted to the reservoir, through which passes the vapours produced by the celestial furnace; the earth is the recipient, in which the aqueous vapours are condensed.

Was Aristotle the first to give an account of this marvellous mechanism? We cannot tell. He previously explained, however, dew to be the condensation of the vapour of water suspended in the air, and which is precipitated on the earth by the action of cold necessary to bring the vapour to a liquid state. He adds, correctly, that snow is only water congealed by a more intense cold. This philosopher also remarked that the water of the sea sustained larger ships than the water of rivers; this is due less to its greater depth than because sea water holds salts in solution. In support of this opinion, he quotes an experiment, since become familiar, by which a fresh egg, placed in a basin of common water, falls to the bottom, while if salt be previously dissolved in the water the egg floats.

This general fact, mentioned by Aristotle, was therefore known to antiquity—namely, that liquids are evaporated by heat and their vapours condensed by cold. But we do not discover in the ancient writings that this fact was realised by an appropriate apparatus.

Pliny, who lived three centuries after Aristotle, describes a process which might have at once led to the invention of a distilling apparatus. "They light a fire," he says, "under a pot containing resin. The vapour rises, and is condensed in some wool spread over the top of the pot in which the resin is heated. The operation concluded, the wool, impregnated with oil, is pressed."

In this process of Pliny's, a pot serves as a retort or still, and a cork of wool is the receiver. How much time and labour it cost before the retort was made to communicate with the receiver by means of a pipe! The simplest things are always the last thought of, and then everybody is astonished that they were not thought of sooner.

History has not preserved the name of him who first thought of making the retort communicate with the receiver; but we may take it for certain that this invention, so simple in appearance, was not realised until seven centuries after Pliny. It is in the writings of Djaber, or Geber, an Arabian chemist of the eighth century, that we find it first mentioned. On the margin of one of the manuscripts of this author (preserved in the Imperial Library of Paris), is the drawing of a veritable distilling apparatus: *a* is the retort, *b* the receiver, *c* the tube of communication adapted to a capital. (Fig. 1.)

The invention of the distilling apparatus singularly contributed to the progress of chemistry. The impulse once given, every one endeavoured to improve so useful an instrument. Among these improvements some were truly fantastic, and most of them were unimportant.

Grain brandy was known in northern countries in the sixteenth century, but its manufacture was prohibited on religious grounds: the grain of wheat was intended to be used only for our daily bread.

A citizen of Nuremberg, one Phillip d'Ulstadt, about the end of the fifteenth century, invented an apparatus called the *two brothers*. This apparatus was intended to produce the *bi-fraternal* or circulatory distillation of liquids. To work it, heat was applied alternately to the retort (pelican) and to the receiver, which by its form differed in no respect from the retort. (Fig. 2.)

After Work.

I AM a steady-going sort of fellow, and very little credit I take for it. The fact is, I like to enjoy myself, and that confession, I should think, will satisfy anybody disposed to cavil at my self-praise, that self-love is at the bottom of it. I do like to enjoy myself; and if my enjoyments are found at home, in a chat with my wife, a game with the children, a little odd jobbing about the house and bit of garden, a walk in the lanes in summer, or a stroll along the streets, to show Nelly the shops, or an hour with the newspaper or book—if, I say, these are my pleasures, they certainly have one or two advantages over the amusements which are sometimes run after. They are cheap, in the first place; next, my wife and family share them with me; and, in addition, I never regret indulging myself in them. I think I have stored up a good deal of love at home; I know I have thought seriously on some matters which I feel I ought to think about. I have read a great many books, both of fact and fancy, and am thankful that there are men and women in the world who have the genius to make great thoughts the property of others less trained and gifted than themselves, and that there is no law of Providence or nature which limits a man's mind to the fashion of his dirty working-clothes, but that he may have something in reserve fitted for his better nature, just as he has a Sunday suit of broadcloth in his box. I was bound apprentice to a trade which gives me a greasy jacket and a black face, but I was not bound to be as senseless as the beams and wheels amid which I work, and blacken my mind as well as my hands, with a tinge, too, that is very hard to wash off.

So, when the bell rings to leave off work, I look forward to a few hours of enjoyment. So do a great many of my mates—some in my fashion, others in fashions of their own, which, I must say, would be anything but enjoyment to me.

We stand for a minute or two chatting outside the gates. Some have empty tin cans in their hands, and some short black pipes. Some are pounced upon by their wives, who have been waiting at the corner, and look very eager and shabby. They want money, and know very well what good wages their husbands get, though very little reaches home. The beershop-keeper gets more than the baker, and the little ones are fed and clothed anyhow.

"Shan't come home!" says Bill Wilkins, who is as good a hand at the vice as any in the shop, and might take as much money as any of us, if it were not for the stoppages. "And just you cut, and don't hang about here with the kids. What would the governor say if he saw you? Where are you going, Joe? I'm good for a pint."

"Up to the 'Lion,' Bill," replies Joe. "I met a chap there last night—a regular swell, tile and necktie to rights—offered to play me at skittles and give me a chalk."

"I'll go with you," says Bill, "and I'll bet a pot on you."

So away they go; and if I were to see Nelly look as that poor woman, Wilkins's wife, looked, I should go mad and do mischief to somebody, most likely to myself. But they are of the bad sort—men who are so far on the wrong road that I am afraid they will never get on to the right one. If their wages were doubled they would be just as poor, and their wives would be just as wretched, and they would have only so much the more to spend on beer and pipes, and in betting that some scoundrelly skittle-sharp would not take the lot in two.

We have several young men amongst us—apprentices nearly out of their time, and young journeymen—who have nobody but themselves to spend their money on, and stand up for their right to enjoy themselves in their own fashion. They would not go in their dirty clothes to play at skittles, not they; but they go to their lodgings, brush up a bit, put on hats instead of caps, and then go to play at bagatelle, or to smoke a cigar and "hear a song." Twice a week there is a "harmonic meeting," as they call it, at the "Rose and Crown." Some "eminent tenor" takes the chair, and is faced by some other eminent person. I went once, just to see what it was like, but I shall not go again. The chairman, who gets 1s. 6d. a night and two glasses of gin-and-water, sings a song—generally "The Pirate of the Isles," or something of that sort—and then "knocks down" the "gent on his left" for another song, having first reminded the company that the waiter's in the room. The gent on the left throws his head back, looks at the ceiling, and sings something about being jolly, and lovely woman, and rosy wine. I should think that the lady who could admire him when he is singing that must be as much like lovely woman as the weak gin-and-water he is drinking is like the rosy wine he has been shouting about. He sings coarsely and without taste, evidently knows nothing of music, and has hazy notions as to the pronunciation of long words; but everybody knocks the table, and tries to persuade himself that it is just the right sort of thing, and that, in fact, "conviviality" and "harmony" are the only two things worth living for. The chairman says, "What shall we say after that, sir?" and the singer, who has been looking under the table at a dirty little song-book, with "Toasts and Sentiments" on the last page, says, "Well, gents, May the wing of friendship never moult a feather." The company knock again, as if they had never heard it before, and were impressed with the idea that to sing such a song as that, and to say "May the wing of friendship never moult a feather," are the great duties of life. It would be a good thing if the wing of such friendship were to moult a good many feathers, and not be able to fly with them to such places any more.

That is how some of our men enjoy themselves. Others go to low theatres, when they can scrape up a shilling or two to spend. Men and their wives, and young men who have no wives, push and struggle for an hour at a door, and sit for five hours in a hot gallery, and enjoy themselves that way. I suppose they believe in remorseless barons, persecuted maidens in white, villanous landlords in high boots and pointed hats with buckles, and village beauties with straw hats pinned to the side of their heads; but I care very little about such amusements.

But there are many at our shop who do not go to low theatres or the harmonic meeting, or play at skittles. Some of the young ones belong to singing-classes, some to mechanics' institutes and workmen's clubs, and a pretty good number are good customers to the shop library. Others are always talking about intellectual improvement—a capital thing, but, like other good things, may be talked about too much. They belong to "halls" where everybody is so enlightened, that it is a sign of mental obtusity to believe in anything. So they have discussions and lectures proving the "impossibility of everything," and settle questions in half-an-hour which the best heads and most anxious, yearning hearts of the world have been engaged with since the beginning.

In these long winter evenings, some of my mates contrive to read a good deal, not only about such subjects as newspapers deal with, but in the higher walks of literature. They are well up in history. Several of them have mastered enough French to dip into works in that language, and others find in the works of Shakespeare, Milton, and Tennyson even, a kind of food for building up the mental structure which some who never look at a book would be astonished at. We attend penny readings and lectures. The readings are very popular, and would be more so if the readers were more careful to consider the suitability of the pieces, both to the hearers and to their own powers. They should not be too long, and the programme should be sufficiently varied to please all.

Several young fellows of the shop are making models of ships, sets of chessmen, alarums for clocks, and other little mechanical contrivances. Others draw, and have capital albums of pencil sketches; while some, who have a musical taste, have acquired a good touch of the fiddle or flute, and meet in twos or threes for practice.

These are winter evening amusements. In the summer, the fresh air, the delicious green of tree and grass, the calm decline of evening, the setting sun, embracing the world in the folds of his crimson mantle before he quits it for a few brief hours, games for the young and old in the open air, the merry race for children, cricket for the young and active men—all invite us to amusements innocent and healthful, within the reach of most, and preparing us for the calm sleep which refreshes us for the work and the pleasures of the morrow

MUNICIPAL SAVINGS BANKS FOR WORKING MEN.

THE movement initiated recently at Bradford has just been followed up at Leicester. The Bradford municipality have given notice that they intend endeavouring to obtain the sanction of Parliament to what is known as the "Bradford Corporation Savings Bank Act." This bill, if passed, will enable corporations to establish Savings Banks, to be conducted on the principle of the present Savings Banks, and guaranteeing the sum of £3 15s. per cent. on all deposits made. The supporters of this measure are in no way opposed to the existing Savings Banks, which are, on the whole, carefully managed; neither do they act in opposition to the recently organised Post-Office Savings Banks. Their leading desire is to afford new and secure means of investment for small capitalists, who will possess ample security for the sums deposited by them, while the deposits will form a fund which will enable the corporation to obtain money, when required, without having to seek it at exorbitant rates in the market, at a time when the rate of discount is high.

At Leicester, Alderman E. S. Ellis stated that the local savings bank was admirably managed, and the deposits had largely increased, showing the confidence the public had in the bank itself. But the manner in which the bank was carried on was not, in his opinion, sufficiently popular for the times. It was open only five hours in the week, and he thought that was not sufficient opportunity for the people to deposit their savings. When one considered the number of temptations which existed at every hour of the day, and almost of the night, for people to spend their money, he thought they should have more facility for saving, and with as little trouble as possible. In the present savings bank there were a great number of inquiries to answer, papers had to be signed, and other forms had to be gone through, which depositors did not altogether like. It seemed to him that people ought to have the opportunity of depositing their money in a bank, in the first place, with perfect security, and, in the next place, with as few arrangements to make when they got there as possible; that the bank should be open the usual banking hours at other establishments; in fact, that working people should be treated just the same as any one of the corporation was treated at their own banks. The bill provided that interest should be paid at the rate of £3 15s. per cent., which should be reckoned as soon as the deposit amounted to 20s., which was at the rate of ¾d. per month. That was an easy way of reckoning the interest, and it represented what would be a fair rate of interest, although it had been thought possible even to allow more than that. At Leicester, the corporation had, at the present moment, borrowed on the security of the property and rates in the borough the sum of £90,000. On that sum they paid nearly at the rate of 4½ per cent.—that was to say, that those amongst them who were wealthy, and had money to put out at interest, got 4½ per cent. for their money. Now, the Town Clerk would tell them that that security was as good as any they could get in the country. Then, on the other hand, let them look at the savings bank. At the beginning of the last year they had deposited £148,000, and at the end of the year £150,000. The depositors, who were principally of the working classes, received interest for that money at the rate of £2 18s. 4d. per cent. The Government allowed £3 5s. per cent. on all money put into their hands, and the committee of the savings bank paid £2 18s. 4d. to depositors, reserving 6s. 8d. for expenses of management, which more than covered those expenses, and that fund was constantly accumulating. He considered the rate of interest was too small for the times in which we lived. Supposing the proposition of the Bradford corporation had been carried out in Leicester during the past year, £1,250 more would have been distributed amongst the depositors than was paid by the savings bank, and that was no inconsiderable amount. If the corporation paid £3 15s. per cent., and allowed 5s. for expenses of management, they would then get their money at 4 per cent., instead of 4½; the people who deposited would have equal security, and a much larger rate of interest. Other advantages would also arise from this system: instead of people sending their money away to be invested in Government securities, at a low rate of interest, it would be invested in their own native town, thus giving them an additional interest in the town.

It is highly probable that the bill will become law during the ensuing session, in which case the example of Bradford and Leicester is likely to be followed by other towns; but, while congratulating the working men of the country upon the increased facilities for secure investments of their savings which the new bill provides, we trust that they will not for a single instant withdraw their patronage from the Post-Office Savings Banks, which, after all, are, in reality, the true banks of the people.

A CONVENIENT DISINFECTANT.—The most convenient, and perhaps the most effectual disinfectant, is chloric ether. It should be burned in a glass spirit-lamp, which is not liable to the same mishaps as other spirit-lamps. Any place of the size of an ordinary room, that can be closed, may be completely deodorised and disinfected by five minutes' use of such a lamp.

Progress by Act of Parliament.

IT is often said that "men cannot be made wise or moral by Act of Parliament." This remark, however, requires to be taken with immense abatement. In this, happily, law-abiding, law-observing land, law has a great deal to do with manners, and nearly every-thing to do with political and social progress. If the public law forbids a thing to be done, hardly any one in England can be found to attempt to do it, however right or beneficial it may in itself be. And this is right. In civilisation there could be no order unless men waited for the sanction of the law before doing that which the law might forbid. When the law is seen to be wrong, the step to take is to get the law altered, amended, or repealed. It seems a morally discouraging thing to say, that a man must not do that which he knows to be right, if the law forbids it. If the law is wrong and immoral, it would seem better to break the law than observe it. But this course, though at first sight plausible, carries many unseen evils with it. If a law may be broken by any one or every one who thinks it wrong, or finds it inconvenient, or has, as he may think or say, a good reason not to observe it, there would soon cease to be any order in the country; and where there is no order there can be no progress. Therefore, it comes to be ruled in a free country, that if any persons discover a law to have become obsolete or hurtful, they shall agitate or urge, in all lawful ways, its repeal, and that the bad law must be borne with until a sufficient number of persons are convinced of its hurtfulness in practice to warrant Parliament in repealing it. One good result of this habit is, that before a law is repealed, the understanding of the public is educated up to the full admission of the necessity of the change. This prevents hasty legislation, which is more mischievous in its effects than tardy legislation, and secures that when a change is made, the desirability of it shall be generally felt, and the public mind seldom goes back afterwards and reverses the step.

Law, in this country, is the solemn expression of the opinion of the highest authority in it. It proceeds from the collective voice of the nation appointed to agree and declare upon what is best to be permitted or forbidden, in the name of the interests of the whole people. Mr. Bernal, for many years the able Chairman of Committee in the House of Commons, used to say, "Law is but morality shaped by Act of Parliament." To demand, therefore, that respect shall be paid to public law, is a matter not only of public policy, it is also an act of self-respect on the part of the people. No doubt the penalties which follow on the violation of a law are very strong reasons why it is not broken, but it is at the same time evident, that the power of swiftly and certainly enforcing penalties, is the result of the public conviction that law once made should be obeyed.

A very remarkable instance of this occurred a few years ago in England. There existed, as is well known, a law compelling the publisher of every journal, or periodical of any description, to print on paper stamped with a penny stamp, affixed at Somerset House. If an editor announced that a duchess had the toothache, or a costermonger had slipped off his humble cart and broken his leg, or that the wages of carpenters or bakers were rising in Manchester or Bethnal Green, every copy of the periodical that ventured upon this dangerous ground of gossip or utility, was finable £20, unless it bore a penny stamp. So that if an editor wished to give any reader a small piece of useful, or a fragment of petty information, it cost him, if he had 200,000 readers, £833 6s. 8d. in penny stamps to give it them. This cost, of course, had to be charged upon the purchasers of the papers; so that in those days no cheap paper could exist which gave current information to its readers. Society had outgrown this repressive and absurd law. We are afraid to say how long it had existed. It dated back to the days of Addison and Steele. In modern times public opinion had long been against its continuance. Yet a few years ago, when a responsible and respectable society, formed for repealing this law, went through the newspaper offices of London, to induce some proprietary to issue a single copy of his paper without a stamp, in order to try the question in the law courts, not a single office, of neither daily nor weekly, could be induced to venture upon the experiment. Though a guarantee of £1,000 was in one case undertaken by a Member of Parliament, as legal security, not one proprietor among all applied to, was found, or could be found, to break the law in the matter of a single copy of his issue. It is folly, therefore, to say that the nature of law in England is not of immense influence for good or evil. It is quite impossible to do a right thing in this country if the law forbids it. Men are made to act wisely or foolishly by Act of Parliament in a strictly governed country. Perhaps this fact may help to make legislators cautious as to what laws they do make; perhaps it may help to increase the zeal of those engaged in obtaining the repeal of bad laws; perhaps, and we have this chiefly in view, it may dispose members of the working class to eagerly avail themselves of opportunities recently opened to them, for improving their condition, by the repeal of several most injurious industrial laws, which almost rendered their social advancement impossible. A law once made in England is a chain or a finger-post—a barrier or a path. It stops the way or it points the way: and if an obstacle, when it is once removed the nation can pass on a new road of progress.

A legal obstacle in England stands like a rock. It is regarded as a fixture of nature. It comes to be venerated as a pillar of the constitution. No lawyer will tunnel it—no legislatorial engineer will blast it. The lazy will not touch it—the indifferent think it as well as it is—the timid dare not approach it—the bold are discouraged by it—the busy are too occupied to give attention or aid: and it is a miracle if it is ever removed. At last, some ardent, disinterested persons, who merely get themselves denounced as nuisances for their restlessness and their pains, succeed in persuading Parliament that something ought to be done.

The legislature has of late years opened several new roads of industrial advancement closed to working men before. The repeal of the Combination Laws gave them the legal right to unite to protect and advance their trade interests. Successive improvements in the Friendly Societies' Acts have enabled them to save £200 where they were only permitted to save £100 before. They can now appropriate certain savings to their own education; even that was forbidden until lately. Now, by the greatest improvement of all, they can become sharers in the profits of a commercial undertaking, without being entitled to a control, for which they were unequal, or responsible for losses they could not meet, which opens a new field of advancement, unhoped-for in England, for long years to come; the advantage, both to employers and to workmen, being so great, that the most sanguine despaired of living to see its enactment. We make these remarks as we have in view to call the attention of our readers to the industrial privileges lately legalised, which, being recent, are very naturally as yet little understood, appreciated, or used.

Coignard's Centrifugal Pump.

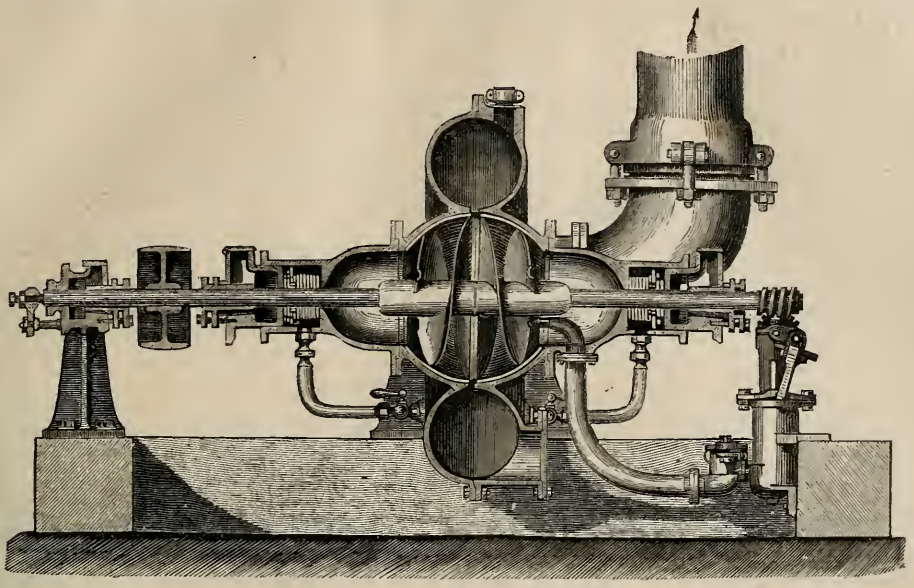
IN the early part of the year 1864, certain French contractors residing at Alexandria, desired to obtain pumps of large calibre, to supply the water necessary for the projected irrigations on the banks of the Nile. All the best makers known were invited to compete, and Coignard's pump, yet new, entered the lists with those which had been tried for a long time in various fields of industry. A judge of unquestionable capacity, M. Tresca, the learned sub-director of the *Conservatoire des Arts et Métiers*, was appointed to pass judgment upon the value of the pumps sent in for competition.

The programme of the competition was far from simple. A pump was required, at the same time portable and capable of raising from 88,000 to 110,000 gals. of water per hour, at least 20 feet. The *Annales du Conservatoire des Arts et Métiers* for January contains M. Tresca's interesting report upon the admirable comparative experiments performed on the Quai de Billy. The figures in this report, relative especially to the other centrifugal pumps on Gwynne's system entering into the contest, are the completest testimony that can be presented of the merits of the Coignard pumps.

Of all the pumps tried, that of Coignard and Co. alone satisfied the conditions of the programme. With the same locomotive steam-engine which served to set in motion all the other experimental pumps, it gave a discharge of 102,300 gals. an hour, while Gwynne's pump gave only 73,920 gals. The pumps on this latter system, many specimens of which were put to the test, presented the inconvenience of becoming disabled frequently; for, as M. Tresca's report shows, only on a single day did the Gwynne pump work for an hour without being obliged to stop. Coignard's pumps, on the contrary, performed regularly without interruption during the whole time devoted to the experiments.

"The experiments with Coignard's pumps," says the report, "were those most easily performed: the working was under perfect command, and a single day sufficed to test them. We may add that, viewing the construction of all the working parts, nothing was found omitted. The feed-pipes especially were well constructed, and all the joints held well together. It rarely happens in experiments of this kind that all the preparations are made with as much care."

Then, while declaring that the problem, which consists in constructing *portable pumps* capable of furnishing, with a draught of 6 mètres (20 feet), a discharge of 88,000 to 110,000 gals. of water per hour, has been given under *exaggerated conditions*, M. Tresca adds: "Nevertheless, Coignard's pump *satisfied* those conditions. Notwithstanding the necessity for too great a velocity, which was the consequence of its diameter being *necessarily*



COIGNARD'S CENTRIFUGAL PUMP—HORIZONTAL SECTION.

reduced, it gave an average of useful effect of 50 per cent. We consider this result very satisfactory, and especially because the excellent arrangement of all the parts of the pump secures perfect stability and regularity in working."

The Coignard pump is especially remarkable for the perfection of its execution. All the pipes are of tinned iron, united by flanges and bolts, leaving absolutely nothing to desire; and when they serve as lifting pumps from a great depth, these accessories have a very great importance.

The boxes of the motive axle are so arranged as to form actual oil-boxes, by which the friction is reduced to a minimum.

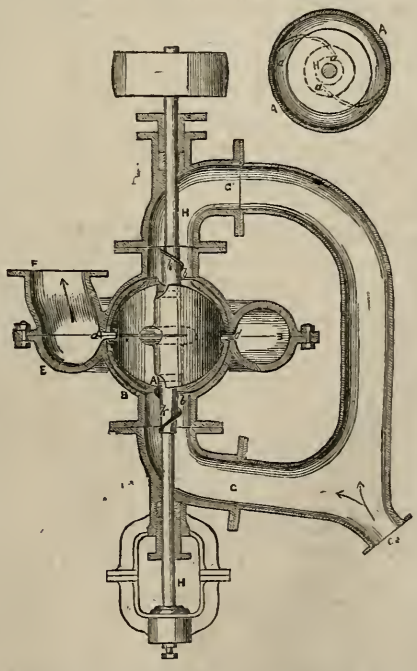
M. Tresca then describes the arrangement of the hydraulic furniture, by means of which, by the water flowing back into the stuffing-boxes of the axle, M. Coignard has succeeded in avoiding all return of air through the stuffing-boxes. After this description of an ingenious organ, the reporter adds:—

"The most important addition, and particularly worthy of notice, is an arrangement, by the aid of which M. Coignard has sought to protect himself from the inconveniences resulting from the accumulation of air round the interior circumference of the drum."

When a certain volume of air accumulates around the axle — and the Gwynne pumps are always liable to this serious inconvenience—this air, not being expelled by the centrifugal force, and, on account of its feeble density, taking the place of the water at the centre, diminishes, and even completely stops the working of the apparatus. The pump is then said to be *dismounted*, and this dismounting entails a host of inconveniences easy to imagine. "This result," said M. Tresca, "is particularly to be feared with pumps intended for exhaustion, when the depth of the water in the well is slight, and that, consequently, the lower extremity of the suction-pipe becomes accidentally emerged." M. Coignard has succeeded in completely avoiding this defect, and, by means of the addition of a small piston-pump, makes pumps which never become dismounted. "This pump," says the report, "draws, at every stroke of the piston, the air or the water taken in at the centre of the apparatus, and throws them out. If it be water, its discharge is added to the discharge of the centrifugal pump; if it be air, *this extraction completely remedies* the inconveniences we have named." To show the efficacy of this *air-extractor*, it will be sufficient to continue the quotation of M. Tresca's words.

"A special experiment has been devoted to ascertaining the effect of the entrance of air by the suction-pipe, which, for this object, was momentarily lifted out of the water. The discharge of the pump was immediately stopped; but, thanks to the air-extractor, the discharge recommenced at the expiration of seventy-five seconds, and progressively increased during the three minutes which appeared necessary to restore matters to their original state. This is a complete and satisfactory proof of the good result produced by this accessory pump."

From M. Tresca's report, it may be safely concluded that the Coignard pump is the best centrifugal pump yet invented, and that it is destined to render great service in the raising of water. For draining, the elevation of water, for irrigation, all public works generally, and manufacturing purposes in which it is important to employ simple, sure, and powerful pumps, great advantage will attend the employment of M. Coignard's centrifugal pump.



A, a spherical drum, revolving closely, but without friction, in an envelope, B. The water penetrates into the sphere, A, by the pipes G G, which may unite and form a single pipe, G 2, through the two poles, b b, of the sphere. The water is discharged by a very small annular aperture, d, the plane of which is parallel to the axis of rotation, and is situate opposite another annular section made in the envelope. The water, driven by centrifugal force, penetrates the closed reservoir of the circular pipe, F, through the small aperture, d. The Inventor prefers to place the axis of the drum in a vertical position, as the pump cannot then become choked with sand or mud.

FIELD LABOUR FOR GIRLS.—The *Long Sutton Parish Magazine* makes an announcement on this subject, which is worthy attention:—"We find that this interesting and somewhat painful subject has attracted the attention of the Government, and that a commission is now engaged in investigation of infant labour in the agricultural as well as the manufacturing districts of the country. We have been long convinced of the practical degradation of the female character by the encouragement of field labour in young girls. If our employers of labour desire to inculcate those habits of modesty, morality, docility, and domestic usefulness, which are essential to the duties and comforts of married life, they will do well to limit their employment of youthful labour to the male sex. The gross association of mixed gangs, the encouragement of coarse and filthy language, of rude conduct, and too familiar intercourse, which prevails in them, can only unfit the girl for the true mission of woman, and degrade her sex to that old level of debased inferiority which she occupied in the heathen days of the barbarous conquerors of this portion of Britain. The true comfort of man depends upon his home; men are capable of going through almost any amount of labour when they have a comfortable home waiting to welcome them; but the wild tone of reckless liberty acquired by a rude taste for the labours of the field in girlhood unfits the tastes and destroys the domestic habits in woman, which alone can make home happy and comfortable to her husband. If our farmers wish for sober and steady labourers, for cleanly cottages, happy hearths, and domestic homesteads around them, they must do their best to encourage *the man* to do his own appointed work in labour out of doors, and *the woman* hers in ministration at home. We cannot but express our satisfaction at the appointment of the commission we have referred to, and shall look forward with interest to the evidence that will be given in the spring, when probably one of the acting Commissioners will be found taking up his abode somewhere within reach of the fen district." The subject is of great importance. The gang system, as at present conducted, is one of the greatest hindrances to the social improvement of the rural labouring classes.

Letters from Lancashire, by a Lancashire Lad.

I.—SOMETHING OF SELF-EDUCATION IN LANCASHIRE.

In commencing a series of letters to your Journal from this district, it can scarcely be necessary to announce that I shall concern myself almost altogether with the doings of that operative population of which so much has been said and written during the past four years. The distress consequent upon the American War, and which is now happily passed away, taught our statesmen that those who only one generation ago troubled them so much, had now so emancipated themselves from the ignorance and the prejudices to which they had been enslaved, as to have become remarkable for their knowledge, and for the patience with which they bore the most dire calamity. Their conduct during the winter of 1862-3 appeared almost a miracle to those who had not watched the progress made by them during the previous twenty years. A history of that period, which should chronicle fully and fairly the many causes which had operated to produce the change which was evident to all, would be, perhaps, as interesting and important a book as could be produced. In these columns I can only pretend to contribute just a little to the right understanding of the changes which have occurred; and, in doing that, I hope to aid in the still greater development of that mutual good feeling and helpfulness which has recently been manifested by all classes of the community.

The better to accomplish my purpose, and to show the stand-point from which I view the things I have to describe, it may be wise, perhaps, to say that many years ago I was a lad working in a dye-house in a Lancashire village. At that time, much work and little leisure was the rule; and those of us who had any desire to educate ourselves found considerably more difficulty than do the lads of to-day. We very frequently had to labour, week after week, at an average rate of sixteen hours per day, and not seldom spent the whole night at work. Looking back at that time, it seems to me strange indeed that the desire to know and understand was not utterly destroyed by the irksomeness of our physical life. I do not wonder that amongst my companions were some of stunted growth, or others with distorted limbs. But even our burdens were apportioned by the same Hand as that which tempers the wind to the shorn lamb. Irksome as our life was, it was not without its pleasures. It had, at times, even a halo of poetry thrown about it. Coming up the dye-house brow late at night, when the pale moon shed its light upon tree and "lodge," and on the river that ran beyond; or on frosty nights, when myriads of stars twinkled with the brilliancy of gems; or on nights when rugged storm-clouds threatened us with their fury, and only permitted the intermittent gleam of moon and stars—we had food upon which the imagination and fancy might grow, and grow more healthy, too, than if fed by the unwholesome fiction which was too profusely thrown in our way. And even in the dye-house, we found occasional half-hours when we might steal away to the boiler-house with our Walkinghame, or Lindley Murray, or hide ourselves in the murk and steam between the "becks" at which we laboured, and there enjoy such books as we could then obtain. Some of us could repeat long passages from the versified romances of Walter Scott; others were deep in Burns and Byron; others, again, discussed questions of theology and politics; others were well read in biography—knew all about Franklin and his kite, about Newton and his dog Diamond, and could repeat (thanks to Mr. Craik and others) long lists of names of men who, from positions as lowly as our own, had risen to honour and renown. Some of us, even in those early days, wrote rhymes for ourselves. We had no pens, pencils, or paper, and so took small, pinky, soap-encrusted boards from the becks, and scribbled upon them with wooden skewers. When we did get free early enough to go to the evening school, we went; and we once determined upon establishing an institution of our own.

From what I have already written, the reader will gather that I am not yet very old; that the lads of my own generation were able to profit much from opportunities which were not offered to our fathers. In its spread in the Cotton Districts, Teetotalism found its way to our village, and by-and-by we had a Band of Hope as well as an adult society. The members of this Band of Hope, spurred to further efforts at self-education by an admirable though poor village schoolmaster, also commenced a Mutual Improvement Society. Some of us had to fit ourselves to teach. One, who is not amongst the living now, won more than our respect by the efforts which, amid arduous toil, enabled him to instruct us all in arithmetic; another of our own village lads was our writing-master; another ambitiously coupled history and geography with reading; and so we managed to get along admirably.

This effort of our own was suggested partly by the success of a similar society at the village of Royton, near Oldham, and not far from our own village. The schoolmaster, of whom I have already spoken, told us all that he knew about the Royton Temperance Seminary, as it was called, and so interested were we in the story, that some of us determined to go over and see it for ourselves. Sunday was the only day we could spare, and that was the day upon which we made the journey. Although it is long ago, and though my memory is well occupied by far different scenes and events, the occurrences of that day are almost as fresh in my mind now as ever. Our walk was a long one, and some of our number were hungry before it was over. There were no ears of corn to pluck, but turnip-fields abounded, and we helped ourselves to a few. One young fellow, a big Cornishman, who did not read much himself, but who had conceived a sort of Newfoundland-dog affection for one or two of the lads who did, chanced to let the knife slip from the turnip into his hand. The cut was an ugly one, and the sight of the blood made the big lad faint. Our schoolmaster-guide ran to a near ditch, and soaking his handkerchief in the water, came back to rescue our companion from his faintness. Will's cut was the only untoward event that happened to us. We reached Royton, walked along its quiet streets, peeped into the faces of the girls, who all of them wore handkerchiefs tied round their heads instead of bonnets, and had thus a primitive prettiness about them, and at length reached the object of our journey.

The Royton Seminary was not a very large building: it seemed much bigger to me then than it did yesterday, when I went there again to refresh my memory. In one room we found globes and maps, and tables sprinkled with papers and magazines. In another was the library. At the top of the stairs was a piece of wood-work which took our fancy very much. It was simply a series of numbered pigeon-holes—each member of the institution having a pigeon-hole to himself. A member coming in placed his library book, with a slip of paper containing the numbers of other books which he wanted, in his special compartment, and then went either to his class or into the reading-room, and whilst he was there the librarian would come quietly, collect the books, exchange them, and place the fresh ones in the pigeon-holes, so that by the time the members wanted to go home, they would have nothing to do but take the new book from where they had left the old one. In one room we found a little organ, and a man playing it. This man had had two fingers torn from one of his hands in the factory, and the skill with which he played piece after piece with his maimed hand was rather surprising. He was, too, the leader and teacher of a fife-and-drum band, held in connection with the Seminary. We found every requisite for such an institution, and all so admirably arranged—such order, such selection, as pleased us all. From the institution we were taken to a mill close at hand, in which several hundred children were being taught, in secular matters as well as in religious, by the working-men members of the Temperance Seminary. We returned home with a much better notion of how working men might educate themselves than we had before entertained.

From what I learned then, and from what information I have obtained since, I am enabled to tell the story of this Royton Seminary. Those who are familiar with the distress, and with the turbulent conduct of the operatives of Lancashire—and, indeed, of the working classes all over the country in the Chartist times of, say, 1840 to 1842—can well understand how unfavourable such times must have been for the establishment of any educational institution. And yet this one of Royton dates from 1840. In that year Messrs. Cooper, manufacturers, allowed the members of the village Temperance Society to use a room in their mill for meetings, and on Saturday nights as a reading-room. A very small library was formed of books given by such of the neighbours as had such things to spare. In 1842 the distress amongst the operatives so increased that, instigated by Chartist agitators, a great movement was set on foot which is remembered as the plug-drawing riot. Starting in Ashton and Staleybridge, this movement spread, until all the district of which Manchester is the centre was fairly in the possession of mobs. Bread was dear, wages were low, and the great cry was, "A fair day's wage for a fair day's work." Even with the experience which we have had in Lancashire during the past four years, it is difficult to say how much was suffered in 1842. Early in the year before there had been some £4,000 distributed by a charitable committee in Stockport. For some thirteen weeks more than 3,000 families had been relieved, and it was ascertained that for that time these people had been subsisting upon little more than one shilling per head per week. The committee was compelled to cease operations for want of funds, and at its cessation had the names of 13,161 individuals on its books, who were then urgently requiring relief. When one considers what such figures mean, and remembers that Stockport was only one of a series of towns in all of which the operatives were equally wretched, he cannot help wondering that want should not have driven them to greater extremes than those to which they resorted. What they did was to proclaim a grand holiday; even those for whom there was work should play; and so the agitator, I suppose, hoped to find in the still gaunter, hungrier bodies of his clients speeches as moving in their eloquence as Marc Antony found in the dead body of Cæsar. Mobs formed, sometimes five, sometimes ten, and sometimes twenty thousand strong, went from one mill to another, demanded that the workers should turn out, and join them in their pitiable designs.

As a rule, property was respected: where the demand of the mob was not at once assented to there was some violence, a rush at the boiler, the plug drawn, and so their design accomplished. It must have been a sad sight to have stood somewhere and have watched the passing of one of these mobs. The gaunt looks of men and women; their unkempt hair; the wild, feverish excitement which kept them together; the pikes and sticks, upon which loaves of bread and huge lumps of bacon were hoisted aloft—the ironical banners of a starving multitude—to have seen all these things would have pained one's heart. Such a mob passed through this village of Royton—some 10,000 people—held a meeting in Cooper's Square, passed resolutions, and succeeded in stopping what work was being done. After the first day some few factory lads of Royton determined that they would not go any further with the turn-outs, but wait quietly in their own village until they might be allowed to go back to the mills. They met in the room in which they were accustomed to hold their teetotal meetings, and read and talked over matters there. They then had to move to a less room, for which they had to pay 1s. 2d. per week as rent, and here, and under such circumstances, the Temperance Seminary had its beginning. The members were all lads, some one or two of the dozen being, perhaps, twenty-two or twenty-three years old. Their subscription was, of course, small. In a very short time they doubled their numbers, and when the mills were opened again, they determined to continue the little educational work they had commenced. They framed rules, the first of which was that all members should be pledged teetotalers; and the second, that all members should be prohibited from gambling. With these stringent rules they prospered, and had considerable influence for good upon the characters of those by whom they were surrounded. By-and-by they built the institution which I and my companions went to see. And now for the result. Of the original members, of course, many have been lost sight of, but I have a record of some. Of those who were factory lads then, one is incumbent of a parish in Cheshire; there are three certificated schoolmasters; five are master cotton-spinners; two are managing mills in Russia, and most of the others have obtained respectable positions as foremen, &c., of mills in this district. Just now the Seminary is more like

an evening club for quiet-living, steady workmen, than anything else: its principles are as exclusive as ever, and, perhaps, it can be little else in the future than what the memory of a good thing always is. All through its existence it has been entirely dependent on its members, for the stringency of its rules prevented its having the extraneous aid which more open institutions could obtain. I am inclined to think myself that, much as this little village institution has done, it might, perhaps, have done still more, if its rules had not been so exclusive. Royton has now four other educational institutions.

Let me for a moment revert to our own village. We came back from Royton fully determined to do all that had been done there. In a few weeks we announced that after a certain date we should charge an entrance fee, to give new-comers a right to a share in the little property we had accumulated; and this led to an alarming influx of members. This, again, led to confusion, and, though many of us received much good from our little work, there is no building standing to-day like that which is the monument of the factory lads of Royton.

Manchester, Jan. 1866.

The Weavers' Dream.

TWENTY-ONE years ago certain working men in a third-rate town in Lancashire dreamed, like Bunyan, a dream. Their subject was different from his. The famous Bedford tinker dreamed of the kingdom of Sin—the Rochdale weavers dreamed of the kingdom of Labour. Both dreamers, however, had one vision—that of the pilgrimage out of the evil and hopeless land. Both knew there was a rugged pilgrimage before them, and the flannel weavers of the town in question resolved, like their great prototype of Bunyan's immortal story, to set out without delay.

We do not pursue any further the parallel between the two sets of pilgrims: a different and simple comparison will be sufficient for our purpose. In 1844 Co-operation was no unknown thing. It was worse than that. As sometimes happens at the police courts, it had, like the prisoner at the bar, been seen there before. Co-operation was an old offender; it had been tried and condemned many times. Many workmen had lost by it; more had suffered disappointment by it. It was regarded as an exploded scheme. To use a nautical simile, the vessel was not seaworthy; in fact, Co-operation was little better than a leaky, rickety cockboat, in which few would sail out into the sea of Industry. It was doubtful whether it would ever get into port, and was sure to be a long time about it, if ever it did arrive. However, a few resolute mariners, who could not be much worse off if they went to the bottom, made up their minds to the attempt.

A year was spent in preparing for the voyage. The sides of the old hulk were caulked, and the old rigging repaired. She had been on the water then sixteen years. Her condition was very frequently discussed, and unfriendly neighbours shook their heads. Others tried to keep up the spirits of the sailors. An outsider or two did take a small share in the venture, but the cargo was almost entirely supplied by the crew which was to man her; and at the end of twelve months she was launched, with £28 worth of provisions, consisting chiefly of oatmeal, salt, and bacon; and general preparations were made for a very rough passage. The town's-people were on the look-out on the shore. The crew were a little shy at getting into so insignificant a craft. Everything was mean, shabby, and poverty-stricken about it, excepting the bravery of the English sailors, who sustained their national renown for pluck and daring. Some of the spectators wished them God speed, but these were too poor to aid, and mostly too desponding to believe in their own kind-hearted hope. Others jeered, for never was a more absurd, battered, leaky old barque seen; and they said, "That's the Weavers' Dream, is it?"

In more prosaic, but not more true terms, it may be told that Co-operation was a distrusted and doubtful thing twenty-one years ago, when the flannel weavers of Rochdale began business in Toad Lane on £28 of capital, the produce of a year's hard savings. Gradual gains were made. Years of vicissitude and progress followed. The "Pioneers' Store" as it was called, increased; members multiplied; new departments of business were opened. Panics occurred, and again it was predicted that the "Weavers' Dream" would end as dreams usually do, in fantastic nothingness.

This was not to be so. The old craft made many voyages, and always an increasing profit on its freights. The storm-clouds darkened its passage, the crew were often driven upon the rocks, but each year they repaired, strengthened, and new-painted their vessel; and at length new ones were launched, amid expressions of confidence unknown before, and rejoicings that none ever thought to witness. At length 1861 arrived, and storm-clouds blew from the South and threatened the wreck of everything. A scorching monsoon blew across the Atlantic, and withered in a night all the vast industry of the northern counties. Then was to come the wreck of Co-operation and the crash of Stores. Then, at last and for ever, the Weavers were to awaken from their long and infatuated Dream!

A few hours ago we received from one of the active members of the Store the annual Almanack of the Equitable Pioneers, in which they give a review of their position—and, we are glad to say, their progress—during the four years of the great cotton famine. Always interesting, the Almanack is this year well written. We learn from this source that in December, 1861, when the panic had commenced, the cash they received over their counters for the sale of provisions and other articles of household and personal use, amounted to £176,000. During the year of 1863, which has just closed, the cash received has reached £196,000, showing an increase of £20,000. Their capital in 1861 was £42,000; now it is £78,000. Four years ago their members were 3,900; now they are 5,300, showing an increase during the panic of 1,400 members. This looks as though Co-operative crafts were places of safety in a storm.

In 1862 these Pioneers built a new shop at Blue Pits. There's a name!—an honest name, however, for the pits deserve it! This Blue Pit shop cost £700. Next year they built a slaughter-house and stables, at a cost of £1,000; and also a new shop at Pinfold, which cost £1,000. This was pretty well for 1863. In 1864 they put up a store at Spotland Bridge, at a cost of £1,150; and another in the Oldham Road, at a cost of £1,700; and last year they finished the Buersil Branch, at a cost of £1,000. The Pioneers modestly say that these buildings do not disgrace the neighbourhood in which they stand. The fact is, there was little or nothing to disgrace—there being no lively or inspiring buildings anywhere about—and these stores are cheerful and wholesome, and not inelegant buildings.

Nor is this all. The Pioneers have commenced excavations in Toad Lane, which they have immortalised—which ought to be called the Pioneers' Highway, for it goes up a hill, and they have made the Hill of Difficulty easy—for the purpose of erecting a great Central Store, which they hope will be an ornament to the town. We hope so too, for Rochdale needs and deserves a few architectural ornaments. During the four years of panic of which we have spoken, the members have drawn out £83,000; the society having been a savings bank on this great scale. Better than this, the Pioneers have given £750 for the relief of the distressed, and to other charitable purposes. And quite as honourable to their intelligence as these gifts are to their humanity, they have appropriated £1,840 to the purposes of self-education. There is more to tell; but we have said enough to show that the working men of Rochdale know how to dream dreams, and that the Weavers' Co-operative Dream has turned out a splendid and instructive reality.

THINGS TO BE FOUND OUT.—Nature is not exhausted. Within her fertile bosom there may be thousands of substances yet unknown, as precious as the only recently-found gutta-percha. To doubt this would be to repudiate the most logical inference afforded by the whole history of the earth. Corn and the grape excepted, nearly all our staples in vegetable food are of comparatively modern discovery. Society had a long existence without tea, coffee, cotton, cocoa, sugar, and potatoes. Who shall say that there is not a more nutritious plant than the sugar-cane, a finer root than the potato, a more useful tree than the cotton? Buried wealth lies everywhere in the bowels of the earth, which needs but the true divining rod of organised action for its discovery.

PARAFFINE FOR WATERPROOFING FABRICS.

IT was proposed by M. J. Stenhouse to employ paraffine to render fabrics, felt, and leather waterproof. An improvement on his process has been suggested, which consists principally in combining drying oils in variable proportions with the paraffine, it having been remarked that paraffine alone—especially when applied to fabrics—was disposed to separate from the fibre after a short time, in consequence of its tendency to crystallise. The presence of but a very small quantity of drying oil causes the paraffine to adhere much more firmly to the texture of the fabric, the oil being gradually converted into a resin by absorption of oxygen.

To apply paraffine to waterproofing, it is first melted with the requisite proportion of oils, and then moulded into blocks. This composition may be applied upon fabrics, by rubbing them with one of these blocks, either cold, or gently warmed; or the compound may be melted and applied with a brush, impregnation being afterwards completed by passing the tissue between heated cylinders. After this mixture has been applied to blinds, awnings, tents, &c., they repel water, but still admit the passage of air.

The fabrics thus imbued with paraffine constitute an excellent basis for the fabrication of a certain class of articles—such as cloaks, awnings, tarpaulings, &c., which require to be rendered completely waterproof, by coating them on the back with drying oils, the paraffine, in great measure, removing the injurious influence of drying oil on the fibres of the textile fabric.

The mixture of paraffine and oil may also be applied with advantage to leather and skins of various kinds. The most suitable means to effect this object, are to coat the leathers or skins of which the articles are made—such as boots, shoes, harness, pump-valves, &c.—with the melted composition; then to gently warm the articles until it is completely absorbed. When leather is impregnated with this mixture, not only is it perfectly waterproof, but much stronger and more durable. The beneficial effects of this process may be specially observed upon boots and shoes, to which it imparts much firmness, without destroying their elasticity. It not only renders them extremely durable, but it possesses this advantage over the ordinary dressing—that it does not injure the gloss or polish of the articles, but, on the contrary, improves both.

The superiority of paraffine over the materials employed in some kinds of impermeable products, consists in its low price, and easy mode of application, without producing any material alteration in the colour of the articles—points which, in the case of white fabrics, or those tinted of light and delicate colours, are of great importance.

PROTECTION OF WATER FROM THE ACTION OF LEADEN PIPES.

IT is well known that water passing through ordinary leaden pipes, or kept in leaden cisterns, becomes impregnated with poisonous salts of lead. Various methods have been proposed to remedy this inconvenience, but hitherto none have proved completely successful. Recently, however, Dr. Schwartz, of Breslau, has suggested the conversion of the inner service of leaden pipe into the insoluble sulphide of lead, which renders the metal so unattackable, that in distilled water kept for a considerable time in contact with the metal so protected, no more lead could be discovered than if it had been passed through glass tubes. Dr. Schwartz operates in a very simple way, by merely filling the pipe with a hot concentrated solution of sulphide of potassium or of sulphide of sodium. The temperature employed is that of boiling water, 212 deg., and the solution is left in the pipe from ten to fifteen minutes. In practice, a solution of sulphur in caustic soda has completely satisfied the requirements of the experiment.

Sulphide of lead is the most insoluble of all the compounds of that metal, and Nature herself presents an example in support of Dr. Schwartz's theory, since the waters drawn from mines of galena (sulphide of lead) are quite free from lead.

MODELLING CLAY.

SOME time ago the addition of glycerine to modelling clay was recommended as a means of preserving its plasticity. Recent experiments fully confirm this property of glycerine. A lump of clay kneaded with a given quantity of glycerine, and kept in a warm room for two months, remained as plastic as on the first day. In this experiment the first step is to completely dry the clay, then to pulverise it, and then to mix it with the requisite quantity of glycerine, of the specific gravity of 1·231. If the glycerine is added to clay while in the moist state, the water gradually evaporates, and leaves the clay deprived of its plastic properties.

If the cost of the glycerine be objected to, it should be considered that the advantages resulting from its use are worth the expense, since the clay retains its plasticity for an indefinite period of time, and is cheaper than modelling wax, which it can be substituted for in all cases, even in the most delicate works, and it possesses the additional advantage of being unaffected by heat and cold. The clay and glycerine are mixed in the proportions of 45 glycerine to 100 clay.

Things Talked About.

ONE of the greatest difficulties earnest and provident promoters and members of Friendly Societies have had to contend against has been the want of accommodation for the purposes of meeting otherwise than in the large rooms of public-houses. Publicans are well aware of the fact, and also know the value of their houses being made places of resort by a large number of persons; hence the eagerness they often show to assist the establishment of Friendly Societies, and the obliging readiness with which they offer accommodation to the members, expecting, of course, a good return in money spent at the bar. Mr. Tidd Pratt, the Registrar of Friendly Societies, has recently published a letter, in which he refers to the subject. He mentions one society of 120 members, at the meetings of which 258 gallons of beer were drank in three years. That quantity is not in itself very alarming, representing only about three quarts per member per annum; but the evil is that the payment of beer money was compulsory on the members, whether they drank or not; and besides, no account was taken of the drinking at the bar, which we may guess to have been considerable. Besides, so eager are publicans to establish societies in their houses that a number of small societies are formed, none having members enough to ensure permanence, and, of course, a disastrous failure is the frequent result. In most of the Working Men's Clubs a portion of the premises is let one or two evenings a week for the meetings of Friendly Societies, whereby great and mutual good has been effected.

The Messrs. Smieton, of the Panmure Works, Carnoustie, near Arbroath, have completed the erection of a Literary Institute solely for the benefit of the workmen in their employ. The building, which has been erected at a cost of £2,000, is very handsome, and contains a fine hall and numerous other rooms. A school for the younger workpeople is attached, and a master and mistress are provided. The opening of the institute took place in the presence of the Lord-Lieutenant of the county (Earl Dalhousie) and a very large gathering of clergy and gentry. Earl Dalhousie highly complimented Mr. Smieton for his liberality, and especially noticed his establishment of a Penny Savings Bank on the works.

The mention of Savings Banks leads us to notice that the Union Savings Bank, at Devonport, has experienced an increase of funds during the past year to the extent of £2,830. The total receipts of the year have been £85,000, showing a surplus of £4,000 on withdrawals. There are at present 15,492 depositors, 138 of whom were new during the year. The money invested with the Government amounts to very nearly half a million! Well done, Devonport! Amazing as has been the success of the Post Office Banks, they have not quite absorbed all the savings of the provident among the working classes.

Dyers must keep their eyes open to new discoveries. Chemists are continually extracting beautiful colours from the most unpromising matters. We have already manve and magenta from coal-tar and the refuse of gas-works. Now we see announced a beautiful indigo blue from peat.

But if M. Frantz, a metallurgist, and M. Henri Faure, a Parisian journalist and chemist, are to be believed, they have achieved a discovery which will throw all others into the shade—nothing less than the transmutation of metals and the secret of gold which the old alchemists went mad about. They announce that "they have discovered a method for transmuting silver, copper, and mercury into gold, which are only one and the same metal in different dynamic states." The philosopher's stone at last. We now only want the elixir of life and a few other little secrets to be penetrated, and then—we shall see what we shall see.

It is well known that the amount realised by the Sheffield Inundation Fund was far in advance of the necessity, and a large amount has been returned to the donors. A proposition is now made that a portion of the surplus should be applied to the establishment of Working Men's Clubs in Sheffield. A very laudable project. Mr. Edward Bennett, of 50, Fargate, Sheffield, is the treasurer appointed to receive donations.

French ironmasters and engineers are vigorously competing with English houses. It is not long since a French manufacturer furnished some beautiful locomotives to one of our largest railway companies. We see it stated, in the *Moniteur des Intérêts Matériels*, that the proprietor of one of the principal foundries in the Pas de Calais is at present delivering a large quantity of cast metal to English houses, and that he has lately concluded a contract for delivering a considerable quantity of cast metal in the British colonies. Another French house nearly obtained a contract to the amount of £13,600 to supply water-pipes for Leeds, but lost it because an English house underbid them by only £4. A close race, and one that will make our English engineers and manufacturers look ont sharply, if they would maintain the old supremacy of England in hardware. The ironmasters of the Moselle district are extremely busy.

Germany would appear to be rivalling Ireland in the rapidity with which the industrial population is being thinned by emigration. Last year 95,000 German emigrants quitted Vaterland, mostly for America. The fact is full of suggestion as to the political and social condition of the German States.

Reduction of the hours of labour is still the subject of considerable agitation. The operative cloth-pressers of Leeds complain that they are debarred from the means of instruction, amusement, and recreation which are enjoyed by their fellow-workmen in almost every other occupation. They begin work at six in the morning; and nine, ten, and often eleven, are the hours for leaving off work. They respectfully request merchants and finishers to endeavour to arrange for their men to leave off work at seven in the evening and three on Saturday afternoon.

The *Birmingham Daily Post* is calling attention to the case of the fishmongers' assistants of that town, who work, on the average, thirteen hours a day. That is not so extreme a case as the other; and in such a trade the long hours are not easily avoided. There must be early marketing, and there must be attendance on the working classes who eat fish for supper, and who very often must perforce postpone their purchases until after their own work-hours. Still, if the men can fairly see their way to amelioration, we heartily wish them success in their efforts.

While others are agitating for a reduction of the hours of labour, the Manchester bookbinders are congratulating themselves on a victory achieved. A few years since they were working sixty hours a week. Now, voluntarily on the part of a large number of the employers, the hours of work are reduced to fifty. In Edinburgh and Glasgow a similar reduction has been made. We trust that the very important consideration of the use to be made of the increased time for leisure is not lost sight of.

A master joiner of Preston is in a curious difficulty with his men. A workman, who was behindhand with trade subscriptions, was pressed to pay up, and knowing that his fellows would not work in the same shop with a defaulter, left the place. The master, Mr. Barber, supposing that undue pressure had been put upon him, discharged the other men. The consequence is, that no member of the Trade Union will work for him unless he consents to pay "a fine of £5." He refuses, and there for the present the dispute rests, the society supporting the discharged men.

Our attention has been invited to a system by which Free Libraries have been established at Alperton, Norlkolt, O'Connorville, and other villages in Middlesex and Herts. The libraries are on the exchange principle, books being freely circulated, whereby each small library is virtually increased in value. The principle is a good one, and capable of considerable extension.

The *Melbourne Argus* is taking credit for the production of locks by Mr. Young, a colonial manufacturer, which are equal to any made by the best houses in England, and can be supplied at the same price as imported locks. A contract for 1,000 mortice locks for the fittings of the new lunatic asylum has been taken and carried out most creditably. Each lock had to be of different construction, and yet each to be opened by a master key. No difficulty was experienced in obtaining competent workmen.

The scheme for supplying London, and many other towns lying on the route, with pure water from the Welsh mountains, and which are the sources of the Severn, is assuming a definite shape. The length of the proposed aqueduct is 180 miles, passing the hills by tunnels and the open country by arches. Three reservoirs on the hills are proposed to contain nearly three million cubic feet of water. The project is gigantic; whether there is any chance of its being realised must depend upon economic considerations, for which we have as yet very inadequate data. The great water companies, whose sources of supply are much nearer the metropolis, will probably have something to say on the subject. But if the threat of competition induces them to increase and cheapen the supply, London will gain greatly.

The Silkstone Collieries, the last of the South Yorkshire coal-pits which were under the restrictive system, began to work full time on Thursday, the 18th inst. An advance of five per cent., with weekly payments, has been conceded. There has, however, been a lock-out at three of the Thorncliffe Collieries, not, we trust, destined to be of long continuance.

RUSHOLME (MANCHESTER) PUBLIC HALL AND LIBRARY.—The annual meeting of this institution was recently held, when Mr. Wilde, the honorary secretary, read the report of the past year, from which it appeared that the average number of members had been 194, against 200 the previous year; and in the day-school there had been an average of 42 pupils, against 40 in 1864. Mr. Lawton, agent of the Association of Lancashire and Cheshire Institutes, had inspected the school, and had given a highly satisfactory report of its efficiency. During the year, 6,401 volumes were issued from the library. The preliminary savings bank was carried on with unabated zeal. The number of deposits averaged 45 per week; the sum in hand is £50 0s. 8d., and the amount transferred to the Manchester Bank during the year, £57 14s. The treasurer's statement showed that the income had been £361 9s. 10d.; the expenditure, £337 2s. 1d., leaving a balance in hand of £24 7s. 9d.

General Information.

CLUBS AND INSTITUTES.

KENTISH TOWN WORKING MEN'S CLUB AND INSTITUTE.—A meeting has been held at this club to consider the best means to be adopted for increasing its usefulness and improving its position. Besides the special committee appointed for the purpose, there were present J. T. Hart, Esq., E. Cobb, Esq., Alfred Preston, Esq., and the Rev. H. Solly and Mr. Pocklington from the Parent Society, with Mr. Barrow, of the Camden Town Club. Several causes were mentioned for the want of greater prosperity—the need of better premises, and especially of a hall for concerts, entertainments, &c., being among the most prominent. Mr. Solly, however, dwelt on the need of more active personal effort on the part of the committee, far too much being left to the secretary, who, though indefatigable in his efforts, could not possibly attend to all the matters urgently requiring his attention. The premises, he said, were good enough to do a vast amount of good in the neighbourhood, if only the club were well worked; and he recommended better organisation with various members of committee to undertake different departments. He suggested that they should get gentlemen in the neighbourhood to bring microscopes, stereoscopes, engravings, maps, &c., as the basis of amusing conversation, one or two evenings in the week; sometimes reading a leader from a newspaper, or anecdotes from a book of travels, arranging for discussions, lecturets, harmonic meetings (free-and-easy), &c., on other nights. Then the members of the club must each and all exert themselves to bring a friend to enjoy what was provided, and thus lead them to join the club. Part of the premises might be let till they could afford to pay for and occupy the whole. Mr. Barrow gave some valuable information respecting the way in which they had gained such great success at the Camden Town Club, which will be embodied in a subsequent notice. The Hon. Sec. asked leave to read Mr. Solly's letter to Lord Lyttelton in the *Daily News*, which was accordingly done. This letter is being published as an "Occasional Paper," by the Council of the Union. The gentlemen present stated their willingness to give what help they could in the way suggested, and steps were taken to carry out the various plans proposed for interesting the working men of the neighbourhood, and drawing them to the club. Thanks were accorded to the visitors, and the meeting separated.

HARTLEPOOL.—The annual tea party of the members of the Workmen's Institute of the West Hartlepool section of the North-Eastern Railway, was held in the Borough Hall, Stockton, when upwards of 200 sat down to tea. At the subsequent meeting, Mr. J. Carson, superintendent of the locomotive department, presided. The state of the institute was reported to be favourable. Several addresses were given, the speeches being interspersed with music and singing. About ten o'clock a ball was commenced, at which 150 couple were present.

INVERNESS WORKING MEN'S CLUB.—Miss Burdett Coutts has kindly sent, carriage paid, the following generous contribution of books to the Inverness Working Men's Club:—Scott's Waverley Novels, 25 vols.; Scott's Poetical Works, 6 vols.; Dickens's Works, 17 vols.; Wordsworth's Poems, 3 vols.; Campbell's Poems; Macaulay's History, 5 vols.; Smiles's Works, 8 vols.; Livingstone's Travels, 2 vols.; and several other works of one volume each, in all amounting in value to upwards of £30. Mr. Thomas Brassay, of London, and Mr. James Falshaw, of Edinburgh, who are amongst the largest employers of labour in Britain, have kindly sent handsome donations to the club. The average attendance is about 150 every night.

THE MIDLAND INSTITUTE, BIRMINGHAM.—The annual Report of this important and useful institution has just been published. It is very interesting, but we regret to learn that the number of members has been slightly diminished since the commencement of the past year, notwithstanding the exertions that have been made by the Council to gain additional subscribers. The average falling off, through deaths, removals, and other causes, has amounted for some years to at least 10 per cent. of the entire number of the members, and the difficulty of replacing these losses by new subscribers has been in some measure increased by the opening of the Free Libraries. The Council therefore express themselves as exceedingly anxious to give its subscribers any increase of privilege that may be thought desirable, and to offer all the inducements in its power to those who have not at present joined the Institute as subscribers. Improved facilities have been made for members desirous of attending the lectures, and it has also been decided to establish a class in elementary chemistry, exclusively for the use of subscribers and resident members of their families. Since the opening of the Free Libraries a large addition has been made to the number of persons visiting the museum of the Institute; the numbers being 2,512 for the past year, as against 1,229 in 1864. In the Industrial Department the number of students attending the various classes has largely increased, the classes themselves being carried on with success. The total number of persons now receiving weekly instruction in connection with this department amounts to 1,067. A class for the study of geology has also been formed, and in every department of the Institute the

utmost energy has been displayed, but the increase of expenses occasioned thereby has caused a deficiency of nearly £330 in the balance-sheet, a loss which we trust the men of Birmingham will not allow to fall on those who have laboured so long and so earnestly in the cause of social and intellectual improvement.

CO-OPERATIVE SOCIETIES.

DUNFERMLINE.—From the recently published report of this association, we learn that at present there are 603 members, with a capital of £1,686. The amount drawn for goods during the past nine months was £9,257, which realised a profit of £671, giving on an average 1s. 7d. per pound as a dividend. The sinking fund amounts to £160. Plans for the erection of a new store, &c., are being prepared, and it is hoped the building will be commenced early next spring.

LINCOLN CO-OPERATIVE SOCIETY.—The seventeenth quarterly report of this association shows that during the past three months £923 have been received for goods; the profits derivable therefrom, amounting to £48 5s. 6d., allowing a dividend of one shilling in the pound on members', and sixpence in the pound on non-members' purchases, after paying five per cent. interest on capital, and reducing the fixed stock account. The capital during the quarter has increased £104 9s. 3½d., the total amount of paid-up capital being £672 7s. 6½d. The amount of withdrawals was only £15 16s. 7½d.

SETTLE (YORKSHIRE) EQUITABLE INDUSTRIAL CO-OPERATIVE SOCIETY (LIMITED).—The nineteenth balance-sheet, for the quarter ending December 16, 1865, has just been issued by this society. The amount of business done during the quarter has been about the average, and though the profits on some goods have been smaller than usual, the society found at its disposal a surplus of £77 14s. 11d., being the aggregate amount of profits for division among members and others who have been purchasers at the store. This was sufficient to enable the society to declare a dividend of 2s. 2d. in the pound on the amount of purchases by members, and 1s. 1d. in the pound on non-members' purchases.

MANCHESTER AND SALFORD EQUITABLE CO-OPERATIVE SOCIETY.—The annual meeting of the members and friends of this society was held on Saturday evening last, the chairman being the Rev. Dr. McKerrow. Mr. Percival, the President of the Society, read the report, from which we gather that six years ago the society commenced with one shop, whilst now they have twelve; that their capital was then about £100, whilst now it is £14,000; that the number of members has increased from 50 to 2,000; that the weekly sales, which only amounted to £50 per week at the commencement, now reach nearly £1,000. Since the beginning of the society, the sales had amounted to £201,697, being an average of £7,757 per quarter; and the net profits realised had been £12,773. Out of those profits, interest on capital had been paid at the rate of five per cent., amounting to £1,719. The sum allowed for depreciation of fixed stock was £888; and donations had been made (to the Infirmary, and other like institutions), amounting to £60. During the last three years £155 had been amassed for educational purposes, and they had £100 as a reserve fund. The remainder, amounting to £9,851, had been divided among members and non-members. Mr. Percival gave an illustration of the advantages of the principles upon which this society was worked. He said that if a member had spent £1 a week from the time the society started, and had allowed his profits to accumulate, he would now have had £30 placed to his account. The society is now £3,000 richer than it was last year. The library, consisting of more than 1,000 volumes, is now open to the members, and the directors will be glad to receive donations of books, &c., which members or others may feel disposed to contribute.

WAGES.

MEETING OF ENGINEERS.—A meeting of engineers, smiths, millwrights, pattern-makers, and other engineering operatives in the north district of London, has been held at the Talbot Inn Hall, Caledonian Road, King's Cross, in furtherance of the movement now agitating the trade for an advance of wages. Mr. Charles Warren, of the Steam Engine Makers' Society, on taking the chair, said the meeting had been called by the Advance of Wages' Committee, consisting of about forty delegates from the leading shops, for the purpose of ascertaining whether the men in the North London district were willing to co-operate in the advance movement, and as to how far they were prepared to go. As soon as the opinion of the districts was ascertained, an aggregate meeting of the trade would be called, the amount of advance to be asked for finally decided upon, and delegates appointed to wait upon the employers with the request. This movement had not been taken up until after due deliberation, and would not be relinquished until its object was accomplished—a better and more just remuneration for their labour. Engineers were, as a whole, a highly-skilled body of workmen, and were shamefully under-paid, and it was not to be expected that they were going to stand idly by and see much less skilled bodies of workmen step in advance of them in point of wages. He had also to assure those present that this was not a society movement alone, but a united movement of society and non-society men. He commended that fact to the attention of certain employers. They saw the wealth of the country daily and rapidly increasing, and they thought it high time to claim a more equitable share of that wealth. Several men then addressed the meeting, urging the necessity and justice of an advance, and offering suggestions as to the best method of obtaining it, all idea of a strike being generally deprecated, while it was, at the same time, agreed that should such a course be rendered imperative, it should not be shrunk from. After a long discussion, in which the question was ably and calmly handled, a resolution was unanimously adopted, "That, in the opinion of the meeting, not less than 10 per cent. advance on the present rate of wages should be asked for."

HAND-LOOM WEAVERS' WAGES.—About a month ago the hand-loom weavers of Barnsley held a meeting to consider the propriety of asking their employers for an advance of 10 per cent. on the then current rate of wages. As the linen trade of Barnsley was never known to be in a more prosperous state, it was resolved to ask for the above advance. We are happy to say that the advance, to the extent of 10 per cent., has been conceded at almost every manufactory in the town. Many other branches of trade in the town have recently been characterised by a movement on the part of the workmen for an advance of 10 per cent. of wages, which has been conceded in several instances.

THE LONDON COMPOSITORS are asking the employers to agree to an increased scale of wages, to the extent of a halfpenny a thousand on all descriptions of work, except newspapers, and three farthings for reprints. At present the minimum rate for establishment hands is 33s. a week; the proposition is that 36s. shall in future be the rate, and the hours of work reduced to 58 per week. Advances in a similar ratio for overtime, corrections, and various technical charges, are also asked for.

LABOUR MARKET.

CAPE OF GOOD HOPE.—By the arrival of the Cape mail we have news from Table Bay to the 9th of December. The distress amongst the labouring classes continued at both ends of the colony. Accounts received from the interior represent the destitution and distress existing there as very alarming. Many men who were commonly supposed to be in a far better position than working men, were said to be suffering severely from privation. The Bishop of Cape Town, on a recent return from a visitation tour, had stated that ostensible proprietors of 6,000 or 7,000 acres of land were actually suffering from want of the common necessaries of life. Very praiseworthy exertions had been made both by the municipality of Cape Town and by public subscriptions to alleviate the distress, but these efforts have been found unequal to meet such a great emergency; and a memorial has been presented to the Governor, requesting him to proceed with some public works. His Excellency admitted the existing distress, and even expressed his opinion that it would increase, but stated that although Parliament had authorised the works, it had not provided the funds for that purpose, and he declined to borrow money without a Parliamentary sanction or a public guarantee. He said either a special session of Parliament must be convened, which he considered it expedient to avoid, if possible, or the men of affluence in Cape Town should guarantee their payment of a certain amount, say £10,000, which the Government would then borrow, and at once set about some public work for the relief of the unemployed. The deputation that waited upon his Excellency agreed that the latter course would be the better, and a committee had since been employed in obtaining the names of guarantors. His Excellency said that there would be no real risk, as Parliament would be sure to grant a vote to relieve the guarantors of their responsibility.

INDUSTRIAL EXHIBITIONS.

BIRMINGHAM.—From the closing report of the Birmingham Industrial Exhibition we find that the total weekly expense for wages and gas was £22 18s. 6d. per week, making a total for the eight weeks of £183 8s.; the cost of the concert was £67 8s.; and of the fiery fountain, exhibited on thirty-three occasions, £75, making a total of £325 16s. The receipts from cloak-room, church, banks, and catalogues were £277 11s. 9d. The admissions during the whole period were, by family tickets, 18,475; season tickets, 13; presentation tickets, 960; schools, 2,500; by payment at door, 134,697; total, 156,645; and assuming that 4,000 were present on the two first days, it made a total of 160,645. The total receipts from all sources were £4,094 5s. There were 623 exhibitors, and the jurors awarded 13 silver medals, 72 bronze medals, and 118 certificates—total, 203, or one prize to every three exhibitors. With each bronze medal the committee had awarded a certificate framed and glazed. The committee held 273 meetings, and after much consideration they had decided that the sum of 200 guineas should be divided among seventeen members distinguished for their zeal and activity, and that 50 guineas should be placed at the disposal of the honorary superintendent; and twenty-nine other members of the committee had been awarded a silver medal with buckle and clasp; making the entire sum expended on the committee £291 10s. The loss accruing from damage during the Exhibition was about £20, and 6s. 6d. was taken in counterfeit coin.

GATESHEAD.—An Industrial and Amateur Exhibition is to be held here in March next. The promoters have met with every encouragement, and their efforts will, in all probability, be crowned with the fullest measure of success.

MANCHESTER.—The Exhibition of Arts and Manufactures for Manchester and district, under the management of the Art Workmen's Association, will be opened in February next, at the Royal Manchester Institution. About £100, subscribed by patrons, is to be distributed in prizes in the various departments of wood, stone, and ivory carving; models in plaster and terra-cotta; ornaments in wrought and cast metal; decorative painting; ornamented and stained glass; designs for and examples of furniture; designs for textile fabrics; mechanical models; improvements in philosophical instruments; improvements in photography. The prizes will be given to workmen only, and the donors will withhold the prizes in any department where the adjudicators think that sufficient merit is not exhibited. Special prizes for apprentices will be given by the Association.

MANCHESTER.—The City Road Workmen's Industrial Exhibition has proved successful, being visited daily by large numbers of working men, the charge for admission being only twopence.

APPOINTMENTS.

TEN JUNIOR APPOINTMENTS in the engineer establishment of the public works department in India will, during the present year, be open to public competition. A competitive examination will accordingly be held at the India Office in the month of July next. Full printed particulars of the conditions on which candidates will be admitted to the examination may be obtained at this office, on application, either personally or by letter, addressed to the Under-Secretary of State for India, India Office, London, S.W.

GOVERNMENT PHOTOGRAPHERS IN INDIA.—To meet the requirements of the survey department in India, the Government of India, at the instance of the Surveyor-General, has submitted a proposition to the Secretary of State to train up eight European gentlemen in England in the arts of photography, photo-lithography, electro-typing, &c., for service in India. On their arrival in this country, those gentlemen will have to remain on probation in the Surveyor-General's Office at Calcutta for a period not exceeding eight months, during which time a subsistence allowance of 200 rupees a month will be allowed to them. After the expiration of the period of probation, they are to be posted to different places in India, on a salary of 800 rupees each per mensem.

PRIZES OPEN TO COMPETITION BY WORKING MEN.

INTERNATIONAL HORTICULTURAL EXHIBITION AND BOTANICAL CONGRESS: PRIZES FOR IMPLEMENTS.—The Council of the Society of Arts offer the undermentioned prizes (amounting to £50) for subjects exhibited in Section IX., under Classes 231 and 232:—Half-sized model, showing the best principle of construction for a tent for horticultural exhibitions, capable of being extended by a multiplication of the parts exhibited; a prize of £10. The best transplanting machine for weights of eight tons and upwards; a prize of £10. The best transplanting machine for half-ton weights and upwards to two tons; a prize of £5. The best method of ventilating plant structures, to be shown by a model; a prize of £5. The best garden wheel-barrow in principle of construction; a prize of £3. The best sun-shade for garden-seats; a prize of £3. The best guard for protecting young trees from animals in parks, orchards, and pleasure-grounds; a prize of £3. The best instruments for working to levels and slopes in garden-ground work; a prize of £2. Earthenware boxes for edgings, capable of producing any length of straight and curved lines for borders in conservatories; a prize of £3. Ornamental flower-pots of large dimensions, of common red clay, for specimen plants, and for terraces; 1st prize, £3; 2nd prize, £2; 3rd prize, £1. The arrangement of all articles shown in classes 231 and 232 must be completed by Monday, the 21st of May, 1866. Such articles must be entered on or before May 1. Intending competitors should apply to Mr. R. Dean, 1, William Street, Albert Gate, W.

THE ARCHITECTURAL MUSEUM offers some additional prizes to art-workmen this year. The Council of this body offer a first prize of £5 (given by the Architectural Union Company) for a boss modelled in clay, representing King David with his harp—the boss to be not less than nine inches over, and to be original in design. The Council offer a second prize of £2, and will adjudicate both. Also prizes for stone and wood carving, silver work, translucid and opaque enamels, and marble mosaic; the particulars of these competitions to be obtained of the Secretary of the Architectural Museum. In addition to the above, certificates of merit will be given in deserving cases. All objects sent in for competition must be sent to the office-entrance of the South Kensington Museum, by March 1 next. The objects will remain the property of the workmen or their employers.

THE ART DIRECTORY of the Department of Science and Art has been published, and states, among other matters of interest, the following particulars of prizes to be offered in competition to all the Schools of Art in the kingdom. The prize list will include ten gold medals,

distributed as follows:—1. For the best study from the antique, in chalk, monochrome, or modelled; 2. The best example of painting a group of still life from nature, in oil or water-colour; 3. The best study of the figure from life, in colour, chalk, or modelled; 4. Six medals for the best designs in the three classes—Architectural Design, Surface Design, and Plastic Design; 5. One medal for a work of a class not included under the above-named heads. Twenty silver medals, of which part will be given to the second best of the various subjects to which gold medals are assigned, and the rest to meritorious works in the same or the best works in other subjects of study. Fifty bronze medals to meritorious works in any of the various subjects of study. Messrs. Chapman and Hall are the publishers of the Art-Directory. It contains instructions and definitions of the greatest importance to students in the Art Schools and Art Masters.

FOREIGN ITEMS.

M. CRESPOL DELISSE.—The death of M. Crespol Delisse, who originally introduced the beet-root sugar manufacture in France, is announced. He was in receipt of a pension from the Government, as a reward for the services he had rendered to national agricultural industry.

MANUFACTURES AT BROUSSA.—This town, situated at the foot of the Bithynian Olympus, in Asiatic Turkey, though represented by many modern books as only a vast heap of ruins, has, on the contrary, almost completely recovered from the disasters of earthquake and fire from which it has suffered within the last ten years. The eastern quarter especially, which was almost totally destroyed, has been rebuilt in the European style, with wide streets and a fine boulevard, ending in the new road to Guemlek. The principal industry of Broussa is the silk manufacture, which has been carried on there for many years past, chiefly by European houses. The town contains 55 spinning-mills, employing between 2,000 and 3,000 workwomen, most of whom are of Greek extraction. Recently several hundred Turkish girls have also been employed, owing to the confidence inspired in families by the wives of the manufacturers. In the Imperial works the Mussulman women form about one-tenth of the whole, and about five-sixths in an establishment directed by M. Brot, a Frenchman. The Mussulman women are well conducted and frugal; their earnings, which amount to 4 piastres a day in winter, and 7 piastres in summer (1fr. and 1fr. 75c.), are a great help to their families. In eighteen months or two years young women save what is thought to be a considerable wedding portion in their country, and soon find husbands. Lastly, a thing not to be overlooked, the too numerous class of divorced women find in these establishments a means of existence which keeps them out of the way of temptation. In the workshops the women are grouped according to race, but the most kindly intercourse exists between them. The mulberry tree is abundant in the environs of Broussa, where it grows on a light soil, under the shade of the olive.

THE MUSÉE RÉTROSPECTIF.—The fine collection of works of art which has been on view in Paris during the autumn, and which was only closed at the beginning of last month, deserves some record. The plan followed was precisely that of the loan collection formed in the South Kensington Museum in 1862. The spacious *salons* of the Palais d'Industrie are well adapted for an exhibition of this sort; but, from the temporary character of the wall cases, and often from overcrowding, the general effect of the whole, and the facility of examining the different works of art, was by no means equal to the admirable arrangements made at South Kensington. The Museum had many important additions made to it after it was first opened, and to this cause must be attributed the want of a complete catalogue; a commencement was made, but the second part only appeared a few days before the closing, so that for all practical purposes it was useless. The collection was intended to embrace the whole range of the art from an early period, but the strength of the Museum consisted in works of the mediæval and renaissance periods. The taste for collecting works of art, and the means of paying high prices for them, are of comparatively recent growth in France. The pursuit of art objects is now, however, just as eagerly followed in Paris as in London, and this has given rise to a class of collectors, half amateur and half dealer, who estimate the money value of their acquisitions quite as keenly as the art value. It may be remarked that in France we do not meet with those heirlooms and objects of artistic value which are preserved among our old families, the turmoil of the Revolution having completely dispersed everything of this kind from the old chateaux, as well as the greater part of the contents of the church treasuries.—*The Gentleman's Magazine.*

NEW SYSTEM OF DRAWING.—M. Hendrickz, a Belgian painter, and inspector of the drawing classes in the communal schools of Brussels, has been for some time in Paris making experiments, under the direction of the Minister of Public Instruction, in teaching working men, utterly ignorant of art, to draw, after a method of his own, which has proved highly successful in Belgium. A class of fifty adults was formed in August last, at the Lycée Bonaparte. The pupils included young men studying under the Polytechnic Institution, clerks, engineers, and fitters employed by the Western Railway Company, and other workmen. One only of these had any notion of drawing, yet, after twenty-two lessons of one hour each, it is reported that all were able to execute complicated drawings with firmness and taste. The Minister has decided that the experiments shall be continued.

ART MANUFACTURE CO-OPERATIVE SOCIETY.—A co-operative society among the manufacturers and art workmen of Paris, engaged in the production of works in bronze, cast iron, zinc, and silver, has just had an exhibition of the productions of its members, for which space was granted by the directors of the *Conservatoire des Arts et Métiers.* Twenty prizes, and as many honourable mentions, with medals, were awarded for modelling, chasing, ornamentation, drawing, founding in bronze and iron, turning, and mounting. This association also appoints delegates, who act as arbiters in cases of disputed copyright in works of industrial art. M. Crozatier, a well-known bronzist, has left, by will, a considerable sum of money for the foundation of an annual prize, to be given to the most distinguished working chaser in metals. The first competition for this prize is about to take place, the pieces having been received at the Hotel de Ville up to the 20th of December last.

Correspondence.

*** *We shall be happy to receive any information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* WORKING MAN, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

THE BIRMINGHAM EXHIBITION.

To the Editor of the WORKING MAN.

SIR,—The letter of Mr. James Gillman, which appears in your paper of the 13th inst., would pass, as far as I am concerned, without comment; but it would be an act of injustice to the committee to let it pass unquestioned. His first statement is, that "£1,000 was guaranteed in prizes." No particular sum was guaranteed for prizes. As Secretary to the Guarantee Committee, I can vouch for my assertion. Secondly, no exhibitor was ever given to understand, by word or deed of the committee, that such a sum, nor any *specific* sum, would be given for prizes, but "that prizes would be given." Again, he states there was a surplus of £3,000. There never was such a surplus in existence, unless in the imagination of Mr. Gillman.

The intrinsic value of prizes given was more than that given by any working man's exhibition in England. Although Mr. Gillman was not fortunate enough to obtain one, none knows it better than Mr. Gillman. Rule 4, which was extensively circulated among intending exhibitors, informing them that "the exhibitor was to bear all risk of loss or accidents;" yet in spite of such rules, the committee, from good motives and kindly feeling towards exhibitors whose goods had (by no act of the committee or its managers) been damaged, either by visitors or removal, awarded such recompense to them as in their judgment they saw fit.

The statement of goods being stolen from the Exhibition, is a libel upon the inhabitants of Birmingham and the surrounding district. The only articles being reported to the committee as stolen, consisted of a small knife and a small kettle, the exhibitors being recompensed by the committee for their loss.

The complaint of the manufactured goods being exhibited at Birmingham, the committee are not responsible for. I very much question if an exhibition would be worth visiting, if they were to be excluded with that rigour which Mr. Gillman advocates. Finally, Mr. Gillman states he has "no other medium" to pour forth his complaints. The local press have refused letters and advertisements from Mr. Gillman's "Committee of Discontented Exhibitors." The "Exhibitors' Committee" then attempted to publish a "A Memorial Volume." The printer submitted a copy to his solicitor, who advised him to burn every copy, which was done; yet Mr. Gillman says it "has been most unfairly suppressed." The surplus, after all necessary expenses are paid, will be given to the charitable and educational establishments of the town, not divided amongst the exhibitors, as suggested and desired by "the Discontented Exhibitors' Committee." I am, sir, yours respectfully, JOSEPH EVERARD.

90, *Ravenhurst Street, Camp Hill, Birmingham.*

[An abstract of the report of the Committee of the Exhibition is given in page 61.]

THE PEABODY BUILDINGS.

To the Editor of the WORKING MAN.

SIR,—As a statement has been made in the *Morning Star* of the 18th inst., which nearly affects every tenant of the above Buildings, will you kindly permit me, as an old tenant, through the medium of your paper, to publicly make known several grievances under which we labour, and to seek to obtain that redress which we have tried in vain to obtain elsewhere? Mr. Somerby, the Secretary to the Peabody Trust, has stated in the above paper, that the tenants are as perfectly their own masters, and free from intrusive interference, as though they lived in the next street. Now this is far from being the case. We are placed under the control of a superintendent, who is possessed of almost unlimited power, inasmuch as we are given to understand that the trustees cannot permit themselves to be annoyed by complaints, except through the superintendent. The public are told that there have been no complaints, whereas complaints are continually made. There are very many things that require an immediate alteration. The closets on the lower flats are open to people from the streets, and are frequently shockingly dirty. The tenants are expected to clean after those from the streets, as well as those in the building. It is true we have ovens and boilers, which would be a very great acquisition; but the ovens are so small as to be perfectly useless to families; while the grates are so large as to ruin us in firing, and most of the heat goes up the chimney. The cupboards are mostly miserably small and dark. The walls of the rooms are bare brick, with one coat of white-wash, which soon becomes dirty; but they are never fresh done unless for new tenants; and if any of the tenants change rooms, they have to pay 1s. to the porter to clean the walls. There is a bath-room in the building, but it is so dirty it is almost impossible to use the bath; and every bath costs 4d. for fuel to warm two coppers of water for each bath, besides the inconvenience of having to drag the warmed water in pails right across a long drying-ground, from the laundry to the bath-room. When all things are considered, the rents are too high, for the rooms are inconveniently small, and the shops use heavy sewing-machines, which not only rock our rooms, but the incessant noise is intolerable. But with all these drawbacks, there is *one* benefit that counterbalances a great deal, which is the perfect security of our furniture.

In asking you to give publicity to these statements, we are not actuated by any other feeling than a desire for justice. We likewise hope that Mr. Peabody himself may see our several causes of complaints, for we sincerely believe that he desires to see those happy for whose benefit he has given so liberally, and that through our complaints being made known, the trustees may be at last induced to inquire into them.

Respectfully apologising for the length of this letter, I subscribe myself, yours obediently, E. FREEMAN.

Peabody Buildings, Shoreditch, January, 1866.

The undersigned have asked permission to affix their names:—W. OWEN, 11, B flat; J. LYNES, 36, E flat; T. SPINING, 60, H flat; E. FREEMAN, 6, A flat.

[We have omitted some passages of a personal character. We hope that the trustees only need to know that such complaints are made, to induce them to institute most searching inquiries into the truth of the allegations, with a view to a remedy.]

JOURNEYMEN HAIRDRESSERS.

To the Editor of the WORKING MAN.

SIR,—Allow me in the first place to express the satisfaction I feel in perusing the first number of the WORKING MAN, and the general indication of the work in regard to what it will be; and in the second, "to tell my own tale" (as your correspondent observes), so that this may be one item the more to contribute to your general knowledge of the every-day life of the working man.

Permit me to observe that the few lines I address to you are not written in a complaining or grumbling disposition, but merely with the sole object of finding out some means whereby the every-day life of my own and similar professions can be improved, without injury to our employers.

I fancy I see you smile as I inform you that the profession I allude to is that of a journeyman hairdresser. All that you know of him is when you pay 6d. for that fidgety operation of having your hair cut—that on the whole he is actually an agreeable fellow, and you cannot see that he has anything to trouble him. But read on a little further. I am coming to the main subject of my letter.

Some time ago I went to be examined by the doctor appointed for me in answer to my application for insuring my life in the Government Insurance scheme, and in answer to an inquiry, I told him my profession. "I thought you were something of that. I cannot say you are quite up to the mark; you require more out-door exercise, regular diet," &c. &c.; just the very thing we journeymen do not get. And now I have got so far, you will begin to think I want to make out that the profession of a hairdresser is an unhealthy one, but I do not. What I want to infer is this—that our profession, and many others, are made injurious to the men through the unthoughtfulness of the employers, and even the public. For instance, in our trade we have workshops, and these workshops are places in which the men assemble during the interval of business in the gentlemen's saloons or the ladies' hair-cutting room; and while we are so assembled, we are employed either at wigwork or cooking our food. You say directly, "Don't you have a dinner hour?" No; and there are very few places, indeed, where we can get even half an hour. Well, these workshops are, almost without exception, underground; consequently, we have to burn gas for light, and have little ventilation, mostly none. Perhaps you will be surprised when I tell you that in some of our shops there are twenty to thirty hands employed—and how? Why, as I have stated, in these abominable workshops, or else in the rooms attending customers, with no time, perhaps, to get a particle of food; and this is going on from nine in the morning till nine at night. And what is the result? Improper light, impure air, irregular diet, all of which, no doubt, could be remedied with a little management.

Could not employers combine to have a more regular system for their assistants? Could not the public comply with the early-closing movement, and let us have less hours for business? Could not working men cease going to shaving-shops on a Sunday, and relieve that class of our trade? Are all shopkeepers' assistants doomed to this irregular life? Anyhow, I am afraid most shopkeepers' workshops are underground in London; and if there is any place in the house not fit for anything else, it is made the *workshop* of; and in London very few shops have any back to them, consequently, down-stairs is used for the workshop. And what is down-stairs?—why, the principal sinks and drainage of the house, the dust receptacle, &c.

A JOURNEYMAN HAIRDRESSER.

POPULAR RE-ISSUE, IN CHEAP WEEKLY NUMBERS, OF THE

"English Cyclopædia," conducted by CHARLES KNIGHT.

The wide range of subjects, together with the universality of information contained in "THE ENGLISH CYCLOPÆDIA," compared with its published price, have placed it in the foremost rank of important and cheap publications devoted to the diffusion of useful knowledge; but the total cost (*if paid in one sum*) to intending purchasers of the whole Work, neutralises in some degree the advantages of its thoroughly useful and interesting character.

A Popular Re-issue, in Cheap Weekly Numbers, will be published as follows:—

On Jan. 20—ARTS AND SCIENCES ..... 5d. Nos.
On Feb. 24—BIOGRAPHY ..... 4d. Nos.
On March 31—GEOGRAPHY ..... 3d. Nos.
On April 28—NATURAL HISTORY ..... 3d. Nos.

Each Weekly Number will contain from 16 to 24 pages, and the whole Re-issue will be completed in about three years.

SUPPLEMENTS TO EACH DIVISION,

bringing up to the most recent period every accession of knowledge connected with the rapid progress in geographical and scientific discovery, and embracing all the most desirable and important facts in regard to history and biography, and tracing in due order the changes of public affairs, either commercial, legal, or social, are in course of preparation, under the editorial superintendence of Mr. CHARLES KNIGHT. Due notice will be given of the publication of the Supplements, which will certainly not exceed the limits of one volume to each Division.

To the Members of Mechanics' and Literary and Scientific Institutions, Working Men's Clubs, and other associations for the purchase and common use of otherwise inaccessible works of research and reference, this mode of re-issue seems particularly well adapted; whilst there are doubtless many individuals who, unable to pay large sums at once, would gladly avail themselves of the opportunity, by easy payments at short intervals, of possessing so useful and extensive a work as "THE ENGLISH CYCLOPÆDIA."

Monthly Parts of each Division as it is published—for the convenience of Purchasers wishing to possess the whole Cyclopædia in less time than by the Weekly Numbers—will be issued at the end of every month; and a Volume of each Division likewise, in a neat strong cloth binding, every three or four months.

The Re-issue commences on January 20, in 5d. Weekly Numbers, of the

ARTS AND SCIENCES;

Or, Fourth Division of "THE ENGLISH CYCLOPÆDIA."
Conducted by CHARLES KNIGHT.
To be followed by the other Divisions and by Supplements.

BRADBURY, EVANS, AND CO., 11, Bouverie Street, Fleet Street, E.C. [1

The Mother's Friend Volume for 1865. Price 1s. 6d. cloth; or handsomely bound, gilt edges, 2s. 6d. No more useful or appropriate Present could be given by a Working Man to his Wife.

The "Mother's Friend" may be had of any bookseller, price One Penny Monthly.

JACKSON, WALFORD, & HODDER, 27, Paternoster Row.

MRS. ELLIS'S NEW BOOK FOR THE WORKING CLASSES.

Share and Share Alike; or, The Grand Principle. By Mrs. ELLIS, Author of "The Women of England," &c. &c. 2s. cloth extra.

"An interesting and instructive story by a very able pen."—*Evangelical Magazine.*

JACKSON, WALFORD, & HODDER, 27, Paternoster Row.

SIX GOOD REASONS FOR TAKING IN

"Merry and Wise" for 1866.

1. Because it will contain Mr. W. H. G. Kingston's New Serial Story, "Washed Ashore."
2. Because it will contain Old Merry's Tour in Switzerland.
3. Because a fine Coloured Picture will appear in the January and July Numbers.
4. Because the Toned Paper and numerous Engravings will render it one of the handsomest Christmas Volumes.
5. Because Mr. Edwin Hodder, Mrs. Bickersteffe, "Old Merry," Nelsie Brook, E. Hope Moncrieff, and other writers, will contribute to make its pages valuable and interesting.
6. Because it will be enlarged to Fifty-Six Pages in January, without increase of price.

Price 3d. Monthly. May be had of any Bookseller.

JACKSON, WALFORD, & HODDER, 27, Paternoster Row.

McLELLAN'S, Lambeth Leather Warehouse, 47, Lambeth Walk, S. [6

Working Men's College

BUILDING FUND.

STATEMENT BY THE COUNCIL.

45, Great Ormond Street, December, 1865.

This College was founded in 1854. The students are, for the most part, working men, and the teachers are, in general, members of the Universities and of different professions, or those who have themselves been students in the College. Its purpose was and is to unite these classes together, by associating them in the common work of teaching and learning. It provides instruction at the smallest possible cost (the teaching being almost wholly unpaid) in the subjects with which it most concerns English citizens to be acquainted, and thus tries to place a liberal education within the reach of working men.

In carrying out these objects we have had some measure of success. The number of students was, at the end of the first term, 145; it is now 509. With the increase in the number of students has come an increase in the number of classes, and for some time past we have been sorely pressed for space.

We want chiefly these things:—(1) A room or rooms for the Art Department. [No department of our College has been more successful than our Art Classes, carried on from the first under the general supervision of Mr. Ruskin.] (2) A moderate sized hall or room for general meetings, lectures, and social purposes, capable of containing some 300 or 400 persons. (3) A better room or rooms than we have now got for the Adult School. (4) A room to contain a Museum, and serve as a Natural History class-room. (5) More small rooms for classes.

A site is already provided, the ground in the rear of the house (12,000 square feet in area) being the freehold property of the College. We are advised that such a building as the one we require can be well and substantially built in a plain but good style for about £3,000 to £3,500.

Financially, the College is self-supporting. For several years, thanks to the excellent administration of our funds by a Students' Finance Committee, the income from students' fees has met our current expenditure, leaving a margin available for the reduction of our mortgage debt.

Considering the vast endowments which the benefactions of former ages have provided for the education of the people, endowments to which the wealthiest of us are the most indebted, it would be a disgrace to a wealthy metropolis like this if it were necessary to beg long at the present day for the inconsiderable sum we are now asking for. And the amount of labour for the benefit of others, which is being voluntarily devoted to the undertaking, and by none more freely than by our students, affords, we think, some guarantee that we shall not misspend what may be given us. Finally, though many a single purse might well defray our needs, we may perhaps especially commend them to those who would be willing to take part in the teaching of this and other colleges if they were not prevented by professional and other avocations. Will they not share our work by helping us to develop it?—Signed, on behalf of the Council of Teachers,

F. D. MAURICE, Principal.

Contributions may be sent to the London and County Bank, Oxford street branch ("Working Men's College Account"); to the Secretary, at the College (P. O. Orders to be payable to Thomas Hughes); or by cheques payable to the order of the Treasurer, R. B. Litchfield, Esq., 4, Hare Court, Temple, or to any member of the Council of Teachers.

Donations to the amount of £350 have already been received or promised, including, among others, the following:—

His Royal Highness the Prince of Wales...	£26	5	0
Rev. F. D. Maurice, Principal, from publication of Lectures on the Suffrage.....	100	0	0
Ditto (proceeds of delivery of the same Lectures at the College)	12	7	10

METROPOLITAN AND PROVINCIAL WORKING CLASSES'

Industrial Exhibition, to be

held at the AGRICULTURAL HALL, LONDON, in the Autumn of 1866.

PATRONS AND GUARANTORS.

The Right Hon. the Earl of Shaftesbury, K.G.
The Right Hon. Lord Brougham.
The Right Hon. Lord John Manners, M.P. Leicester, N.
Lord Burghley, M.P. Northampton, S.
H. Barnett, Esq., M.P. Woodstock.
G. R. Barry, Esq., M.P. Cork.
Right Hon. H. A. Bruce, M.P. Merthyr Tydvil.
Thomas Chambers, Esq., M.P. Marylebone.
Right Hon. W. Cowper, M.P. Hertford.
W. T. Cox, Esq., M.P. Derby.
W. Hart Dyke, Esq., M.P. West Kent.
R. C. Hanbury, Esq., M.P. Middlesex.
Sir Thomas Hesketh, Bart., M.P. Preston.
Lieut.-Colonel Hogg, M.P. Bath.
W. Jackson, Esq., M.P. North Derbyshire.
George Leeman, Esq., M.P. York.
Alderman Lusk, M.P. Finsbury.
A. Mitchell, Esq., M.P. Berwick-on-Tweed.
Samuel Morley, Esq., M.P. Nottingham.
C. W. Martin, Esq., M.P. Newport, Isle of Wight.
Major-Gen. Sir H. C. Rawlinson, M.P. Frome.
C. S. Read, Esq., M.P. East Norfolk.
C. Schreiber, Esq., M.P. Cheltenham.
Osborne Stock, Esq., M.P. Carlow.
Sir James Tyler, J.P.
G. H. Whalley, Esq., M.P. Peterborough.
J. Clayden, Esq., Mayor of Saffron Walden.
P. Le Neve Foster, Esq., Sec. of the Society of Arts.
J. Howard, Esq., Mayor of Bedford.

TO EXHIBITORS.

Contributions of Skilled Workmanship or Amateur Productions will be accepted from all parts of London, the Provinces, Scotland, and Ireland.

PRIZE MEDALS,

regulated in value according to the success of the undertaking, will be awarded for the most meritorious productions.

THE SALE OF ARTICLES

exhibited will be especially encouraged, and the price, if desired, may be affixed to the objects. An office will be opened in the building for the transaction of this business.

THE GREAT HALL,

the largest in London, will be fitted up for the display of industrial objects, no charge being made to exhibitors for occupying space.

SMALL WORKSHOPS, WITH AND WITHOUT STEAM POWER,

will be fitted up round the building. These will be let, under special arrangement, to persons who may desire to manufacture and sell articles during the Exhibition.

THE MINOR HALL

will be fitted up as a Picture Gallery and Fine Arts Court. Here will be exhibited, under the sanction of the Lords of the Committee of Council on Education, a series of works of art illustrative of the instruction afforded in the Government Schools of Art throughout the United Kingdom.

CONVERSAZIONI, &c.

It is contemplated to grant the use of the Lecture Hall to Trade and other Societies, for the purpose of enabling workmen to invite employers or friends to conversational meetings; also, under special conditions, to Amateur Musical Associations.

FLOWER SHOW.

Facilities will be afforded for holding a Flower Show, in connection with the various existing Amateur Horticultural Societies in the Metropolis. Early application from societies is solicited.

SCHOOLS.

It is intended to invite the whole of the school children in the Metropolis and adjacent districts to a free inspection of the Exhibition.

CHORAL SOCIETIES.

The Tonic Sol-Fa Association will give six concerts of 1,000 voices each; the children of the Bands of Hope will also occupy six evenings, 1,500 voices to sing on each occasion. Instrumental music will be performed by the Police, Volunteer, and other bands.

ART AND INDUSTRIAL UNION.

In order to facilitate the sale of articles which Exhibitors may desire to dispose of, application will be made to the Board of Trade for special authority to legalise the issue of shares in the same manner as that adopted by the various art unions now in existence.

FORMS OF APPLICATION FOR SPACE, NOW READY,

may be obtained by sending a stamped and directed envelope to the Secretary, Mr. W. J. Watts, 7, Birchmore Terrace, Cardington Street, Hampstead Road, London, N.W., or by application to the following

HONORARY AGENTS.

Bedford—Mr. A. Franklin, 5, Queen Street.
Bermondsey—{Mr. Richard Faunitt, 71, Grange Road. {Mr. G. Dodson, 1, West St., Neckinger Rd.

SEE THE PROSPECTUS OF THE

Southwark Metropolitan and

Provincial Freehold Land and House Society, wherein the following Questions are solved:—

How to Buy a House and Land with its own Rent? How to Invest Money with Perfect Security and Large Interest? How to Borrow at a Moderate Rate, with Convenient Re-payments?

SAVINGS BANK DEPARTMENT.

Trustees:

THOMAS PILLOW, Esq. JAMES POLLOCK, Esq.
W. H. GERMAN, Esq.

FIVE PER CENT. INTEREST. Dividends paid Half-Yearly.

LOANS DEPARTMENT.

Money advanced without delay for the purchase of Property, wheresoever situated. REPAYMENT by Monthly Instalments spread over any number of years, by which a House may be Purchased with its own Rent.

☞ Redemption at Pleasure.

FREEHOLD LAND DEPARTMENT.

Building Plots of Freehold Land may be procured through the Society, conveyance included, at little more than the ordinary cost of inquiring into title, &c. PAYMENTS, 2s. and 5s. per Month. The Estates of this Society are situate at Norwood, Mitcham, Gravesend, and Peckham. Shares can be taken at the Offices daily. Persons may obtain Plots at once, which may be paid for by Instalments. Advances for Building on the Society's Estates and elsewhere are being made.

THE WORKSHOPS OF THE WORLD.

SAW MAKING.

Sheffield Saw Manufacture.

THE saw is of great antiquity. It was known to the Egyptians and other early nations, and traces of its early use have been discovered in nearly every country where the arts and sciences have made the least progress. In England, Sheffield—the metropolis of our manufactures in steel—has had the saw-making almost entirely to itself, many hundreds of skilled and intelligent artisans being continually employed in this important branch of industry.

In former times, there was little variety in the shape of the saw, which in general appearance strongly resembled the *bow-saw* used by the carpenters. At the present day, however, the different kinds of saw—such as the *cross-cut-saw, pit-saw, frame-saw, ripping-saw, hand-saw, panel-saw, compass-saw,* and *sash-saw*—are almost endless; the making of each kind of saw forming, as it

were, a distinct trade or occupation. The common description of saws are made of rolled iron plates, hammer hardened, and planished upon an anvil, whereby they attain the requisite degree of stiffness and elasticity. The better kinds of saw are made of shear or cast steel. The steel, which has been prepared in thin sheets, is cut—as shown in our first illustration—into strips of the required size, which, after the edges have been smoothed and levelled by careful filing, are handed to the grinders to roughly prepare them for cutting the teeth. Much has been said respecting the unhealthiness of the grinding processes, but the saw-grinding is stated to be far less detrimental in its effects upon the health of the workers than are the other descriptions of grinding. Dr. J. C. Hall expressly states saw-grinding to be a comparatively healthy occupation. "The men," says he, "stand at their work, and, consequently, the lungs are not so compressed as when the grinder, sitting on his horsing, bends forward for many hours each day in other branches of the trade." The real danger—one, in fact, from which none of the grinding processes are exempt—consists in the flying of the grindstones. The stone, while revolving at a fearfully rapid rate, will sometimes fly in pieces, the fragments crushing and destroying everything in their way. These accidents occur from flaws in the stone, or from the defective manner in which it is fastened on the axle. Fixing the stones on the axles by means of iron plates, instead of wooden wedges, which are liable to swell from moisture or the heating of the iron axle, is considered to be the best safeguard against such accidents. In America the same processes are performed by machinery; but, according to Mr. Ibbotson, a Sheffield manufacturer, the operatives of the town will have nothing to do with work thus prepared. If this statement be true, it is to be regretted, because it will gradually give the foreign workman an immense advantage over the Sheffield artisan.

When the strip of steel has been ground smoothly on both sides, it is given to a workman, who, by means of a die-cutter in a fly-press, rapidly cuts the teeth, one or more at a time, with astonishing precision. This process forms the subject of our second illustration. After one or two subsequent minor processes, the saw is again hardened and tempered, and then it is handed to a grinder to be ground for the second time. The grinding, both on this and the previous occasion, is performed with the assistance of water, which prevents the particles of dust rising from the stone, as in those cases where water is not used, as in razor or knife-grinding. But whether the process be wet or dry, the grinder is exposed to the danger of inhaling air laden with fine dust while "hacking" or "razing" the grindstone. These processes are rendered necessary by the circumstance that the continued grinding of the saws has the effect of rendering the surface of the stone so smooth that it will not "bite" or "hold;" hence the surface must be roughened either by "razing"—that is, by holding a bar of steel to the stone while revolving—or by "hacking," which consists in roughing the grinding surface with a pickaxe. Sometimes this latter operation has to be performed twice a day, especially if the stone be of unequal texture, as in such a case the softer parts would wear out more rapidly than the harder portions, thus occasioning the stone to lose its true circular shape.

The grinder presses the saw to the stone by means of a board, which he holds to the upper surface of the saw, and against which he presses with all the strength of which he is capable, for the purpose of grinding the surface of the saw as evenly as possible. To economise his strength, the grinder stands upon tiptoe, his feet resting on planks raised on each side of the "horse," or seat, and bends slightly over the stone, which revolves with startling rapidity. While thus engaged, his hands, arms, breast, and knees are all, more or less, brought into action, thus occasioning some of the grinders to present splendid examples of muscular development. While grinding one end of the saw, the other end is made to rest on a kind of *trapéze* at the side of the stone, whereby the grinder is relieved from the task of supporting the weight of the saw. The smaller saws are ground by the men in a sitting or stooping position, as shown in the larger illustration.

The face, hands, and clothing of the grinders, during this process, become covered with a yellowish stone incrustation; but the particles of stone being held in solution by the water, they are to a great extent prevented from entering the mouth and lungs; hence the comparative healthiness of the saw-grinding trade. After being thus ground, the saw is found to have lost much of its flatness and elasticity. To restore these, it is subjected to a fresh hammering, and afterwards to the action of a coke fire, which renders it of a pale brown or straw colour. The surface is smoothened by being passed lightly over a grindstone, and finally polished with a fine hard stone, and a glazing-wheel covered with chamois leather and emery, or a wooden wheel known as the *hard head*. The saw is then cleaned by women or boys, and given to the *setter*, who adjusts the shape and curves of the teeth in the manner required: subsequently the teeth are sharpened, and then the saw is ready for use. In saw-grinding the heavy nature of the work prevents any extensive use of children, as in other trades, it being stated that no lad under the age of fourteen is allowed to mount the "horse." The condition of the grinding-sheds is, however, far from being what it should be. The floors, frequently of earth, are often sloppy with wet, from which, as well as from the draught and cold, the grinders naturally suffer, sometimes to a considerable extent. This might be avoided by the use of properly-paved floors, with drains to carry off the surplus moisture. Indeed, there is no reason why a saw-grinding shed should not be as clean and smart as the factory-rooms at Saltaire, or one of the other model industrial establishments which have recently been erected in the northern manufacturing districts.

Sectarianism and Party Politics in Working Men's Clubs.

The following letter, and Mr. Solly's reply, being on a subject of considerable interest to the managers and members of clubs, it is thought that these remarks may be useful to other societies besides the one originally addressed. It was on this question that the first Working Men's Institute in the kingdom—founded by the late lamented Rev. F. W. Robertson, at Brighton—suffered mournful shipwreck; and there is no greater difficulty, in many cases, with which Working Men's Clubs and their promoters have or will have to contend.

"———, Jan. 12th, 1866.

"Sir,—Will you kindly oblige me by saying if the Club and Institute Union would interpret our 1st rule * as preventing us from receiving any contributions of books or periodicals of a religious tone—say a book of sermons, or any Protestant publication.

"I remain, Sir,
"Your obedient Servant,
"———, Hon. Sec."

"Working Men's Club and Institute Union,
"150, Strand, London, W.C.
"Jan. 18th, 1866.

"Dear Sir,—I am at all times very happy to answer inquiries concerning the management and well-being of Working Men's Clubs. The question in your note is an important one, vitally affecting the very existence of these societies. It is a difficulty, moreover, which has frequently occurred, and naturally will often again arise.

"The general principles which we think should guide the managers and promoters of clubs in this matter, are as follows:—First, since the clubs are intended to afford certain social benefits to all working men, without distinction as to their religious or political opinions, holding itself entirely neutral and impartial on all these subjects—as well as on various other controverted questions, such as Teetotalism, Trades Unions, Strikes, &c.—the money contributed by members, whether ordinary or honorary, should not be spent either, in a large or small amount, on books or other publications advocating views on either side of such topics. It would be manifestly unjust to purchase those on one side and not those on the other. But even if both were bought, this would still be a perversion of the objects for which the contributions were given. Nothing like political, religious, or social propagandism and controversy should be allowed in a club; otherwise, its purely neutral character, its welcome for persons of all sects and parties, would be destroyed. But, Secondly, it is quite a different matter when, as in your case, books, &c., of a religious character are offered *as gifts*. The money of the society, in that case, is not being expended for any sectarian purpose, and so far no member could feel aggrieved. But then, it is plainly necessary that if you accept presents of books or periodicals, newspapers, &c., advocating one view of controverted subjects, you must also receive them if offered when supporting the opposite view; otherwise, you at once take part with the former against the latter, and destroy your neutrality.

"Now, whether it be advisable or not to accept such gifts must depend, I think, very much on local circumstances, and cannot be altogether decided by general principles. If the gift of a volume of sermons is likely to be followed by the presentation of Tom Paine's works, or the presentation of a Protestant newspaper by that of a Roman Catholic journal, the donors of the first *may* consider it better that neither should be given; or if either the religious work or the secularistic publication entering the club *by itself* were likely to stir up bitter controversy, and convert the peaceful social meeting-ground into an arena of strife, members might feel that the said publication were better withheld. On the contrary, should there be no probability that any of the members would object to the introduction of a particular work or newspaper, and no likelihood of its leading to what could be regarded as retaliation, or to controversy of any kind—if, in short, the publication in question would not be viewed, in all reasonable probability, as a violation of the great fundamental principle of neutrality in such matters—the club would simply be so much the richer, and, perhaps, the members so much the wiser and better for possessing it.

"Clearly, it is necessary that each such case should stand on its own merits, and be finally determined by local circumstances, under the guidance of the above general principles. For what would be a violation of neutrality in one club or in one part of the country would not be so regarded in another; and a publication that would only do good in one club, where difference of opinion on the subject did not exist, might be the cause of controversies in another that would destroy the society. Moreover, the matter that would be deemed objectionable by some members may be in so small a proportion in a particular publication, or may be so mingled with what all parties view as valuable, that they would gladly bear with the one part for the sake of the other. It is impossible to lay down a rigid, unvarying rule that shall beneficially apply to every club, or every book and newspaper. The managers and members of each society have to exercise a faithful judgment, applying the great principles on which clubs are formed as far as they will go, and scrupulously testing every proposal by a reference to them; but as faithfully considering whether the *common good* of all the members might not be promoted by any proposed measure which did not interfere with the neutrality of the club on controverted questions.

"A most important point, I may further be allowed to suggest, is, that every member of a club who feels strongly on any controverted subject in relation to religion, politics, or social science, should carefully guard against viewing the club as a convenient platform or fulcrum, whereon to advance his views on those points by direct advocacy, except so far as a discussion class may legitimately, and by common consent, give him a fair opportunity. Unquestionably, a club would afford a capital machinery for making converts, until the process had broken it up (which would probably be very speedily), even as a razor might excellently serve to cut slate pencils. But clubs are not formed for this purpose, and cannot be used to further it without a perversion of their objects which would be as dishonest as unwise. There are, or ought to be, suitable agencies for all desirable direct proselytising, but clubs are certainly not among the number. Even in discussion classes, the aim should be mutual improvement and educational enlightenment, rather than propagandism and proselytising; and I am strongly of opinion that theological questions had better always be excluded from those most valuable meetings.

* "Rule I.—That this Institution be called the ——— Working Men's Club; the objects of which are to provide instruction and amusement for members, free from sectarianism and party politics."

"Herewith I send you two of our publications, containing passages bearing upon this question, as well as the paper which you asked for, on 'the Conditions and Advantages' of joining our Union, and I sincerely hope that the views I have suggested may help to guide your course aright. I cannot conclude (though I trust it is almost needless to do so, frequently as I have urged the subject in the publications of the Union), without saying that I am profoundly convinced of the inestimable benefit these clubs derive, whenever religious influences can be brought to bear upon them to promote the common good—*not for controversial purposes*, but for the development of men's spiritual nature, cultivating filial reverence and brotherly feelings, and thus preparing for more specific religious teaching elsewhere. When this can be done in an unobtrusive manner, with the full concurrence of the members, or at all events without exciting opposition, or disturbing the general harmony, I believe that great good may be accomplished. By these influences I do not necessarily mean direct religious services, Bible, or prayer-meetings—though I am thankful to know that even these have been held in more than one club by the common agreement of the members, with unmixed benefit attending them;—but I refer more especially to the influence for good which every sincere Christian must always exert wherever he goes, and according to the opportunities legitimately offered to him. I have long been convinced that neither clubs nor any other societies, founded on the idea of mutual benefit, can possibly flourish unless they are managed and worked by persons of high principle, of single-minded devotedness to duty, and who habitually seek that help and guidance, without which we cannot expect the Divine blessing on our work.—Believe me, my dear Sir, very truly yours, "Henry Solly."

Notice to Secretaries of Working Men's Clubs and Institutes.—The secretaries of Working Men's Clubs and Institutes who have not yet sent replies to the application of the Council to them for information on various points of general interest, are respectfully reminded that much of the value of such information depends on its being furnished about the same time as that at which other clubs are affording it. The Council are prevented from making use of the portion received, by waiting for that which has not been sent; and in earnestly requesting committees and secretaries kindly to forward them the returns filled up as soon as may be convenient, they desire to make it distinctly understood that this information is sought simply to enable them to use it for the benefit of the movement in general, and of individual clubs, which depend so greatly for success upon obtaining the experience of other clubs and general statistical facts. The Council trust it is unnecessary to say that they have neither the desire nor the power to exercise any sort of supervision or control, nor to interfere in any way with the management or operations of clubs and institutes, whether affiliated or not to the Union.

TRUE MANHOOD.

You tell me of your thinking man,
Who chops and chews his logic;
Of him who dabbles with the stars,
And matters meteor'logic.
But tell me, can his soul respond
To any cry that's human?
For if it doth, I'll grasp his hand—
"A gallant and a true man!"

A man may stand with kings, or roll
Up to the neck in bullion;
But if his heart be hard and cold,
He's meaner than a scullion.
What are the gems of India? what
The gold of California,
When linked not with a kindly soul?
Vain baubles all, I scorn ye!

I smile at him who boasts his "blood,"
Nor care for any son of them;
There were but eight in Noah's ark,
And I have sprung from one of them.
Then let our standard be unfurled,
With this inscription on it,
"We're brethren all, though some wear crowns,
And some the peasant's bonnet!"

Oh! if a man should heal the grief
That warps and stings another,
Should hang a rainbow in the cloud,
Because he *is* his brother;
Then, though in pomp of pedigree
He count but an ignoble man,
I'll lift him high above the crowd,
And say, "Behold God's nobleman!"

G. S.

Art and Handicraft.

V.—THE LOGIC OF INDUSTRIAL ART.

ORNAMENTAL art, in its relation to manufactures and decoration, has been treated by artist-painters and sculptors, and many art critics, as a matter which could not be referred to any fixed principle of judgment, but was rather a question of personal choice or whim. Yet, at the same time, it was maintained that, in order that the national taste, as applied to industrial productions, should be developed, a national patronage of the Fine Arts, as regards collections of paintings and works of sculpture, was an absolute necessity. The precise relation which existed between these two phases of art has never been distinctly defined, although endless platitudes have been written and spoken on the subject. Many persons, like Haydon, maintained that "the greater involved the less:" in other words, that he who could paint a good picture, or model and carve a good statue, would inevitably possess the power to design, model, or carve a good ornament. This is only a partial truth. In fact, it is only a truth so far as this, that he who can paint a good picture, or model and carve a good statue, is, from the very nature of his education and previous practice, well suited to make a good ornamentist, if he chooses to devote his attention to the *special* study of ornamental design. In other words, having mastered one phase of art, and that, too, which deals most directly with a truthful imitation of Nature, as a basis, he is better qualified than he otherwise would be to take up the question of ornamental art.

Of late years this fact has become more and more recognised by the advocates of national patronage of art and art education—that pictorial and sculptural art is one thing, and ornamental art, in its truest and best, because most useful sense, is quite another thing. There are a large number of artists of great and varied powers in the pictorial and the sculptural who would be quite conscious of making very sorry figures, in more senses than one, if called upon to design ornament for any really industrial or decorative purpose. In fact, experience has shown that the most lamentable failures have resulted in attempts made by artists in what it is usual to call the higher walks of design when they have condescended to attempt the practice of this same faculty of design, when applied to the lower and less dignified walks of art in its application to works of absolute utility. As illustrations, it would not be difficult to point out examples of monuments and drinking-fountains as objects which come most prominently before the general public, which, if analysed upon sound principles of decorative and constructive design, would show how little it is possible for an able painter or sculptor to know of this supposed inferior phase of art, whilst justly enjoying a well-earned reputation in that to which he had specially devoted his attention. In short, the successful study of the pictorial and the sculptural no more qualifies a man for the practice of the ornamental than the knowledge of one language gives the scholar the power to write and speak in another. As, however, the knowledge of one language is frequently a great help, and may in some cases be absolutely necessary to the acquisition of some other language, so the study of the artist-painter and sculptor forms a basis of no ordinary value in the acquisition of a thorough knowledge of the principles and practice of ornamental art in all its phases. In fact, if the time of the student permits, the more fully his practice can be carried in this direction—the main purpose for which he studies being kept in view—the more thoroughly artistic will his education be, and the more capable will he be of grappling with the varied phases of decorative design as they present themselves.

The fact, however, cannot be too strongly insisted upon, and certainly ought never to be lost sight of by those entrusted with the education of the English artisan, or our future manufacturers, that ornamental art requires a special, well-understood, and distinct course of study; that whatever may be the varied character of the designs required for practical use in the various great manufacturing centres of the nation, the precision which comes of a proper study of geometrical proportion—the power of re-production and intelligent conventionalism, which is the result of an earnest and loving study of natural form, especially in the vegetable kingdom, down to its minutest details, can never be dispensed with, without a loss to the future power of the designer.

So far as English designers and art-workmen have been successful in the practice and execution of original designs when applied to manufacture, it has arisen out of a steady devotion of their attention to the special question they had in hand; and this is precisely the course which brought the French and German designers to the position in which they stood some years ago, when they were so much in advance of their English co-workers as to lead to the inference that the character of the education they had received partook more of the character of the education of the artist-painter and sculptor than it really did. One advantage which the French designer and workman had, and still has, over the English artisan-student, is that he is more surrounded by an atmosphere of art, and Paris especially presents many more advantages in the form of grand and noble buildings, statues, galleries of art, and museums, than even London. Of course, the art student in English provincial towns works at a still greater disadvantage.

Nothing need be said here about the inferior position which the decorative arts hold in England in public estimation as compared with the Continent. It is part of the national work yet to be done to equalise this estimation, and in so doing stimulate the ambition and powers of the workman as a student.

In addition, however, to the art-knowledge—that is, the power to express by certain means and in certain materials the ideas of form and decorative details which constitute a good ornamental work—there are certain first principles which should ever be borne in mind in designing and executing such works; for it is to the neglect or misapprehension of these principles that so much bad construction in form, and bad and inappropriate detail in decoration, is chiefly owing. It is, therefore, to these principles attention has now to be directed, since it must, as a matter of course, be assumed that the workman employed on any art work has a given amount of skill in drawing or modelling, or, better still, of both; whilst, as regards the manufacturer and the general public, it is presumed that they take interest enough in the question of the tasteful construction of the objects of which the one is the responsible *producer*, and the other the constant *consumer*, to care to know why a decorative object is of right or wrong form, and the details of its ornamentation are in what is usually called good taste, such taste being simply the exercise of educated judgment, based upon the principle of the fitness of things and the rules of common sense—which is, briefly, that anything made for *use* shall be adapted in form to the purpose for which it is to be used, that the material of which the object is made shall be suitable for the purpose, and that the details of the decorations shall not be contradictory to the character of that material in its natural structure; whilst, finally, the design of the form and ornamentation shall not be of such a character as to involve unnecessary labour, and consequently cost, in its production. In my next I shall formularise these conditions, and endeavour to briefly illustrate their application.

George Wallis.

The Necessity of Labour.—Others have said much, and better than I could do, of the inherent worth and value of labour, in its effects upon the labourer. I will rather ask your attention to the less lofty, but yet all-important view, of the absolute necessity, if we would avoid the most dire distress, of hard and continuous labour in a country like this—an ancient and settled country, a crowded country, one of which the internal resources are necessarily limited at any given time, and which, while it has no doubt large foreign resources, still, by its insularity and remoteness, must always depend very greatly for its well-being upon what it finds at home. It is not so in all countries, nor in all states of society. In southern and tropical climes, in new colonies, in thinly-peopled countries, among nations of simpler habits, hard and constant labour is not found indispensable. But with us it is. Nature is here a kind and willing dispenser of her gifts, but she is also a stern one. She will not give them for nothing: her great Master will not allow her to do so. Labour, and that not blind labour, but skilled and intelligent, must be given for them.—*Lord Lyttelton, at the Opening of the Birmingham Industrial Exhibition.*

Letters from Lancashire, by a Lancashire Lad.

II.—SELF-EDUCATION IN LANCASHIRE.

It would not be difficult to fill page after page of your paper with stories illustrative of the self-education of our operative population. The peculiarity of the work in Royton was such as to make me select it for the subject of my first letter, and I now purpose continuing the same theme by relating facts respecting some of the workmen of Burnley.

Burnley is an important town in East Lancashire, and, like most other towns in this district, it has grown rapidly to its present extent. In 1801 the population was little over 5,000, whilst now it is at least 45,000. The inhabitants are noted for retaining many features of the old Lancashire character, such as may be seen described in the works of Bamford and others. Increase of population generally means prosperity, and of this Burnley has had its share; but at intervals great suffering has prevailed here. Many middle-aged men can relate how, when they were much younger than they are at present, they suffered from want, keener, if possible, than that from which England's grand benevolence has recently saved them. In that old time the rich did not understand or sympathise so much with the poor, and the poor looked upon the rich with apprehension. When hard times came there was no such inflow of funds as there was seen in 1862—3: what relief was afforded was supplied almost altogether from local sources. There was one time of distress, whilst the factory system was in its earlier stage of development, which may be briefly referred to. Then much of the weaving was done at home, and the work was "put out" at warehouses. One bitter winter, work was so "slack," that at every putting-out day many had to return without having a warp to put into their loom, and the competition for such little work as there might be was always very keen. At the warehouse the rule was "first come, first served;" but as it was difficult to secure the strict carrying out of this rule among the mass of half-starved operatives who crowded about the door, these workers themselves devised a scheme which at once exhibited their sense of fairness and their sad condition. A long string was tied to the latch of the warehouse door, and each comer laid hold of this string as near to the latch as possible. In the order in which they stood, finger upon this string, did they enter the warehouse, and take their chance of employment. Early, very early indeed, did they turn out of their homes on those winter mornings, and wait hour after hour for the opening of the warehouse door, whilst their limbs were benumbed by the frost, or their scant clothing, instead of sheltering them from the weather's inclemency, did but retain the bitter cold of rain, or sleet, or snow. Strangers who visited Lancashire during the recent distress, learned that the remembrance of those old days were still fresh in the minds of the operatives, and that the word "dow"—dole—was a reminiscence of them. The shadow departed, and prosperity visited the people again.

Whatever may be said of other portions of the cotton districts, it would seem that the apprehension of much demoralisation, resulting from the recent long-continued dependence upon charity, needed not be felt respecting the operatives of Burnley. Although it cannot be said that the mills of the town are all fully employed—some are stopped, and some are only working part time—it is yet true that there is less pauperism now than was the average for this time of the year in the years preceding the cotton famine. This indicates a return to independence which it is very pleasant to note.

It has been the custom of late, in some quarters, to decry efforts at scientific teaching amongst the working classes. It is urged that after a hard day's work they are unfitted for severe study, and that it would be wiser to draw their attention to the lighter forms of literature, and so educate the taste and the imagination, instead of making abortive attempts to fill their minds with hard facts, or train them to become skilled in languages and mathematics. Whilst we should recognise what of truth there is in these remarks, we ought also to remember that there is something to be said on the other side. Not long ago, statements such as those I have just recounted were made by a gentleman at a prize-distribution in East Lancashire. After the meeting, this gentleman, with a well-known baronet and others, went on to the railway station. Whilst there, the baronet, seeing a group of the prize winners, determined to ascertain what they thought of his friend's argument. He went up to one rather uncouth-looking youth—a diamond in the rough—who had a bundle of prizes under his arm, and asked what *he* thought about the matter. The lad looked up and said, "It con be done, if they've nobbut a mind." That was it. If the "mind"—the will to learn—was in a lad, he could do it. Indeed, they are doing it just now in Burnley very successfully.

The Burnley Mechanics' Institution is almost a model one. Its reading-room is the resort—the exchange—of the moneyed people of the town; its library is used by rich and poor alike; and its class-rooms are filled by lads and lasses from the factories. The classes here have been eminently successful, and this is owing, I feel sure, very much to the tact and skill of a friend of mine, whose name I should like to mention; but who, though still loving to do good by stealth, would yet blush to find it fame. I don't remember attending classes of factory girls anywhere whose education was so advanced, and whose dress showed so entire an emancipation for the evening from factory associations, as the education and dress of these Burnley girls. In the lads' classes there is, of course, more noise, and less regard to outer appearance; but there is also a very thorough attention to the work they are about. From these rooms lads have gone to occupy positions much better than those in which they were born, and it it is a noteworthy fact that true eminence has been won mostly by hard study of physical science, of mathematics, and of languages. I will call attention to a few instances. Whilst I do so, I would ask the reader to remember that to advanced students the class-room is little more than a place in which he may measure his own progress by comparison with that of his contemporaries, and obtain the advice and encouragement of his teacher. The actual work of study must be done in the quiet of home, and in time stolen from rest or pleasure.

I doubt whether it would be possible to relate a more striking instance of self-education than that of a gentleman—he deserves that name, although he is only a factory book-keeper, who manages to sustain himself and his wife on a pound a week—who may be seen almost any night in these class-rooms of the Burnley Institution. The story of his life is a very simple one. He was born some twenty-eight years ago. He does not remember how he learned to read; but his first notions of arithmetic he obtained from his grandfather. Whilst very young, he went to one or two schools, but only irregularly, because, being the eldest child, he had to stay in the house nursing, whilst his mother was at work in the mill. He commenced working mensuration when he was about nine years old, and says that, when he was ten, he had a fair acquaintance with Bonnycastle. He had, also, a passionate fondness for music, and made as much headway with that as with mensuration. He commenced working away from home in his twelfth year—first as a shop-boy, and then went to the mill to learn weaving. It is rather singular that, for some six or eight years after this, his passion for books and study seemed to have departed; but about the year 1854, he began to look round him, and seeing that if he meant to lift himself, either intellectually or socially, it was time that he began, he resolved to enter upon a course of self-instruction. He studied at home for a while under very considerable disadvantages, and then joined the institution classes. His progress was rapid, and he was so careful about obtaining thorough mastery of the subjects he studied, that he never had much occasion to look back regretfully. Since the year 1857 he has competed again and again at examinations, and his success may be gathered from the following list of prizes and certificates which he has obtained:—

1857. East Lancashire Union of Institutes	2nd Class Certificate, with prize of £4.
1858. Lancashire and Cheshire Association of Institutes	3rd Class, English History, and 3rd Class, Geography.
1861. Ditto ditto... ...	1st Class, Mensuration; 1st Class, English Composition.
1861. Society of Arts... ...	2nd Class, History; 3rd, Mensuration; 3rd, Music.
1862. Ditto ditto	English History, 1st Class Certificate, with 2nd Prize (£3); Arithmetic, 1st, and Mensuration, 2nd.
1862. Lancashire and Cheshire Union	Arithmetic, 1st; Decimal Currency, 1st.
1863. Society of Arts	Book-keeping, 1st Class.
1863. Department of Science and Art...	Inorganic Chemistry, 2nd Class, with Queen's Prize.
1864. Society of Arts	Algebra, 1st Class Certificate, with 1st Prize; Mensuration, 1st, with 2nd Prize; Chemistry, 1st, with 2nd Prize; Electricity, &c., 2nd Class Certificate.
1864. Department of Science and Art	Acoustics, Light and Heat, 2nd, with Queen's Prize; Magnetism and Electricity, 1st, Queen's Prize, and Bronze Medal; Inorganic Chemistry, 1st Class, Queen's Prize; Organic Chemistry, 1st, Queen's Prize.
1865. Society of Arts	Animal Physiology, 1st Class, with 1st Prize; Music, 1st, with 1st Prize; Geometry, 3rd, and *Prince Consort's Prize of* 25 *Guineas.*
1865. Department of Science and Art	Animal Physiology, 1st Class, Queen's Prize, with Gold Medal; Elementary Mathematics, 1st Class, Queen's Prize.

And last year he also obtained the following Science Master's Certificates:—

Animal Physiology, 1st Class; Inorganic Chemistry, 1st Class; Magnetism and Electricity, 1st Class; Acoustics, Light and Heat, 2nd Class; Elementary Mathematics, 3rd Class.

Reading over this list of certificates and prizes, and remembering that some of the examinations at which they have been won were very stiff ones, we cannot help seeing that the youth who thus succeeds deserves very great praise. It ought to be remarked that the Science and Art Department's examination in elementary mathematics is accounted so stiff that it is rare for students to enter, and that the gentleman of whom I am now writing is the only person who has carried off the first-class certificate. He does not intend resting with what he has already gained, but hopes to crown them by winning a scholarship in Jermyn Street, either this year or next. I know that my readers will wish him God speed.

During the recent distress, a friend of mine chanced to see another young Burnley operative with one or more of the prize books which belonged to the book-keeper mentioned above. He went and asked how this was, and learned that, being out of work, and unable to purchase books, he had borrowed from his friend, leaving other books of his own in pledge for them. My friend went to see this student No. 2; found that he was a weaver; that, owing to the mill being stopped, he was in a sad plight; and that, instead of depending upon the relief committee for aid, had obtained some little work at a lawyer's office, for which he was receiving 3s. 6d. per week. With this small pittance this young weaver determined to enter into competition for a scholarship in one of our Dissenting colleges; he was wanting books—Greek and Latin Grammars, and Dictionaries—and had borrowed what he could from his companion. He was still wanting the Greek books, and my friend went to a clergyman whom he knew, and who, I am sorry to say, refused to lend to so ardent and so poor a student. But the books were got, the weaver laboured at them, went and won his scholarship, and is to-day in the college; and by-and-by I hope he will exhibit in the pulpit conduct as admirable as that which I have described.

Some five or six years ago there was another weaver attending the classes of the Institution whose success deserves recording. Spare moments at the mill were occupied in the study

of languages; and his overlooker chancing one day to pick up the Greek Testament, which lay in the lad's waste-can, could not help expressing his astonishment that anybody could read the queer characters contained in it. It was more than Greek to him. This weaver lad went and won his scholarship, although he had to compete with an Aberdeen M.A. From a Burnley weaving shed he has transferred himself to a Yorkshire pulpit, and is winning the admiration and esteem of all who know him.

About the same time, another weaver was so successful in his studies as to be appointed to a congregation without any residence at college.

It would be easy to add to the cases I have given, but this is scarcely necessary. The fact that self-education is still pursued in Lancashire as I have described; that even in the midst of that distress for which England felt and did so much, there should be lads so resolute in their pursuit of knowledge under difficulties as even then to win their way to college scholarships—these things deserve to be known, so that a right knowledge may be had of the efforts and aspirations of the best of our working men. This is not the place in which I might properly allude to the political tendencies of the day; if it were, I should like to remind certain statesmen whose voices are now and then heard in the House of Commons, and certain journalists whom I might name, that they could as easily do justice to the great class from which the men I have described above have risen, as they now do injustice. It is easy to sneer at special forms of philanthropy, which may, perhaps, be too obtrusive in their working; but it would, I think, be wiser to look for and recognise the many signs of self-improvement which are manifested on every hand. "Men might be better did we better deem of them;" and if this line from one of our living poets were taken as a motto by some of the critics of our social condition, they might encourage and help where now they only embitter many who are conscious of their own rectitude, and of the severe struggles which they have made in the past, and are making still, to win for themselves the spoils of knowledge, and so enable them to exercise wisely the rights and privileges of citizens.

Working Men's Dwellings.

BEAUCOURT.

THE best solution of the problem of providing working men with suitable dwellings, is being worked out in France in a very satisfactory manner. In previous numbers of this Journal we have shown what has been done at Mulhouse and at Guise; we now propose to show what has been done at Beaucourt, on the estate belonging to Messrs. Japy, Freres, and Co.

This subject has, in fact, for some time past, occupied the attention, in the highest degree, of large manufacturers, companies, and all the friends of industry generally—*cheap workmen's dwellings*, and, as a necessary consequence, the *workman-landlord*.

The workmen's dwellings at Beaucourt are of that class to which preference should be given whenever practicable, inasmuch as they supply an independent house and home, which the dwellings of the character of those at Guise, and the Peabody buildings in London, do not provide. But the choice in these buildings must necessarily be governed by the locality. In cities, where land is of so much value, the barrack-like construction must be adopted; but in the suburbs, the cottage-house and garden system may and should prevail.

The houses erected at Beaucourt, fifty in number, were undertaken by a land society, with a capital of 100,000 fr., which was subscribed by mechanics and working men generally, and foremen and managers of the locality. This kind of co-operation is well deserving the attention of the manufacturer, since it is found that as soon as a working man acquires a house of his own, he gives up resorting to the public-house, and becomes in every respect a better workman.

The project of the dwellings at Beaucourt was planned and worked out by a young draughtsman of the factory, M. Gaufroy, who, having been for some time past much engaged with contractors, masons, and carpenters, has conscientiously and practically studied the question of "lodging the working man." He seems to have solved the problem—a more difficult one than it appears at first sight—of the construction of workmen's houses in a very satisfactory manner, and presenting the following advantages:—

1. Independence of the proprietor or landlord, by isolating his house from neighbouring dwellings.

2. A more convenient and less expensive habitation than that of houses built in *flats*.

The economy of construction is due to the slight foundations, which permit of the walls being made of minimum thickness, and built without employing scaffoldings; and to the suppression of staircases, and the unavoidably lost space in storeyed houses.

The masonry having no great weight to sustain, a depth of foundation of about sixteen inches will be sufficiently solid to bear the walls. The soil being stony below that depth, the cellar requires masonry only on the side against which the ladder from the kitchen is placed. In most of these houses the cellar is simply hollowed out of the rock, without any masonry at all.

By constructing houses in pairs, a saving of £4 (100fr.) per dwelling may be effected. Quadrupled houses increase the cost, in consequence of the dimensions of the roof. But the workmen rightly regard independence as

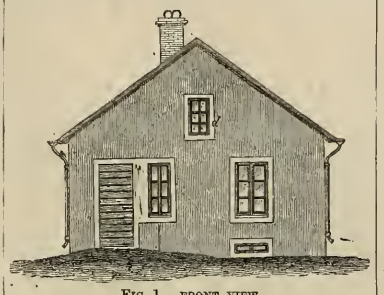

FIG. 1. FRONT VIEW.

a first condition, and wherever double or quadruple houses have been in the market they have failed to meet with purchasers.

All of these houses constructed during the summer of 1864 were sold to workmen and other *employés* for 2,000 fr. (£80) each, and a larger number to shareholders, at 5 per cent. interest, guaranteed by the firm of Japy and Co., and issued half-yearly.

Most, if not all, the houses are now occupied. The visitor is agreeably surprised at the convenience and comfort presented by these dwellings. The firm of Japy and Co. has made a slight sacri-

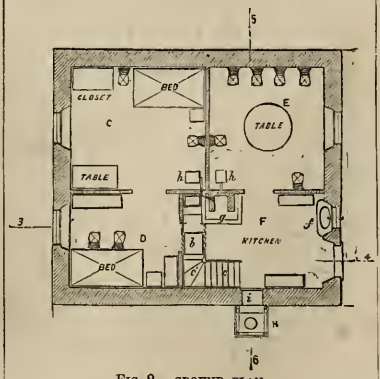

FIG. 2. GROUND PLAN.

fice of land, to enable each landlord to have a garden to the extent of one-tenth of an acre around his house. The grouping together of the houses and gardens forms two charming and picturesque villages, one of which is already in full animation.

Fig. 1 represents one of these houses, viewed in front; Fig. 2 is a plane or horizontal section; Fig. 3 is a vertical and longitudinal section, through the line 3, 4; Fig. 4 is a transversal section, through the line 5, 6.

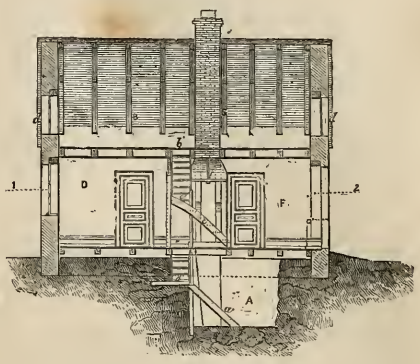

FIG. 3. VERTICAL AND LONGITUDINAL SECTION.

In Fig. 4 A is the cellar, made by an excavation in the soil; it is entered by a ladder, *a*, which, by bending at a right angle, presents an intermediate landing-place, *a'*, under *c'*, which, by the ladder, *c*, establishes a communication between the ground floor and the cock-loft.

The opening to the cellar is closed by the trap-door, *b*, and that of the loft, B, by the trap, *b'*. This loft, provided with two large windows, *d*, being divided, may be made to supply two habitable rooms, if required, as is frequently done.

The largest room, C, on the ground floor, Fig. 4, is 12½ ft. by 11¼ ft., and can, if necessary, contain two beds. The two other rooms, D and F, are of smaller dimensions, and can be used as bed-rooms; or one may serve as a keeping-room, as marked E on the plan, Fig. 2.

The kitchen, F, is provided with a sink, *f*, and a stove, *g*, the funnel of which is placed directly under the chimney, G, into which the other stove-pipes are conducted.

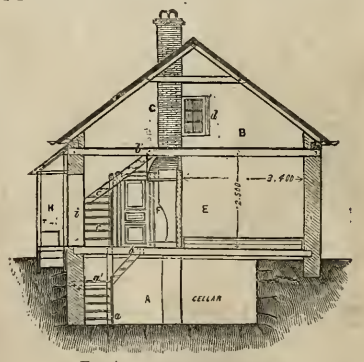

FIG. 4. TRANSVERSAL SECTION.

A door, *i*, in the wall of the kitchen, near the ladder, gives access to the water-closet, H, which is outside the dwelling.

CONTRACTOR'S PRICE, TWO THOUSAND FRANCS (£80).
Summary.

	fr. c.
Earthwork	56.63
Masonry and mortar	1246.20
Carpentry	278.56
Cabinet Work	423.39
Ironmongery	74.52
	2079.30

2079 francs 30 centimes is £83 3s. 5½d.

Buildings on the same plan are now in course of erection at Badevel and at Lafeuchotte.

"ONE more question, Mr. Parks," said a counsel to a witness, who happened to be a tailor. "You have known the defendant a long time. What are his habits—loose or otherwise?" "The one he's got on now, I think, is rather tight under the arms, and too short-waisted for the fashion," replied Parks. "Stand down," said the counsel.

After Work.

ANOTHER WAY OF LOOKING AT IT.

It may be all very well, Mr. Working Man, for my mate Tom to write as he does about what we do with ourselves when we have done work. We are not all so clever as he is, and it does not follow, because he has a taste for reading books, and others have not, that we should not enjoy ourselves in our own fashion, and find our pleasure in something we can understand. Tom is a real good fellow, as true as steel, and has a pleasant way with him that makes everybody like him; but he is just a little bit too good for the rest of us, that's a fact. He will be a foreman before long, and I should not much wonder if he ends by being something a great deal better than that.

Whenever I am in a fix I go to Tom, and he puts things in such a clear light that I believe what he says, though I could no more give the reason for it than I could have built the *Great Eastern* by myself. I wish I was as clever as Tom, I do; but I am not, and never shall be, and there's an end of it.

One good thing I have learned from him, and that is, to leave off bad language. Some of our men do swear awfully, and Tom always has something to say about it; but he does not lecture us, or look as if he was so awfully above us that words which might do for us are too bad for him to listen to, but he manages to make us feel that we are hurting ourselves by using them. This is one of his ways of putting it:—

"Do you know what an adjective is, Sam?" says he.

"Not just exactly, Tom," I says; "but I know you are up to something. What's your little game now?"

"An adjective, Sam," he goes on, "is a word that expresses the quality of a thing. When I say, 'This is a good vice,' or 'a bad hammer,' 'good' and 'bad' are the adjectives. Don't you see, Sam? That was an adjective you used just now, and you had better not use it again, for it's an uncommonly bad one. I was looking through my big dictionary the other day, and by way of amusement I made a rough calculation of the number of adjectives in the English language. There are somewhere about nine thousand; and yet you use only about a dozen, and half of them are such as no decent, truthful man ought to use, for they are bad in their nature, and do not in any way apply to the matter in hand. That's a small stock to put in your shop window, Sam. Try a few fresh specimens."

The very next time a queer word rose to my lips I stopped it in time, and thought of what Tom had said about the adjectives. At first it seemed funny to have to look about for the right word, but I found it at last, and now I know a lot of them.

But that is not what I want to write about. I told Tom quite straightforward-like that I thought he was too hard upon some of us fellows, who treated ourselves to a few hours' amusement after work. I like a stroll in the summer evenings as well as he does, but I do not want to go into the fields. I like the streets best. Some of my mates and I go out for a walk, and we meet some men from other shops, and we find lots to talk about, and we put our hands in our pockets like gentlemen, and just have a friendly pint when we say good-night. Tom goes out into the fields, where there are no shops nor anything to see, and where you cannot get so much as a pig's trotter or a sausage for the old woman's supper, and never meet any of your mates, and he picks up flowers and things, and sticks them into a book.

"What's the good of flowers?" I say to him; "you can't eat them."

He looked at his wife (a real nice woman she is, and no mistake) and said something which I suppose was out of a song-book. I asked him to write it down the next day, for I cannot bear him to think that I don't understand what he talks about, and these were the words:—

> "A primrose by the river's brim
> A yellow primrose was to him,
> And it was nothing more."

That's queer stuff, I thought. Our fellows would laugh if I began to sing that. It won't go to any tune that I know of. Besides, I am pretty sure there was not a primrose at all in all the flowers he had in his hand.

Tom does not care about the theatre, he says. Well, he can stay away if he likes; there's no law to make him go there. But I do like it, and so does my missus. And every now and then we go, and we do not mind the squeezing a bit; it makes us enjoy the play all the more when we get comfortably shaken down into the seats.

We do enjoy ourselves, and no mistake! Bill Jones is there with his young woman, and hasn't he just put on his red and blue necktie! Here come the fiddlers. "Music! music! Play up, and then we'll leave off stamping!" We are in the front row, and look over, and they are just as jolly in the pit as we are up here, and don't mind a bit of orange-peel on their heads, although ginger-beer bottles are past a joke. Up goes the curtain. "Higher! higher!" "Shut up, you fellow, will you? How can we hear?" "Turn him out!" Well, all is quiet at last; all the bonnets that have got loose from the rail and fallen into the pit have been fished for with shawls tied together, and picked up, and we settle down to enjoy the play. It is a stunner. "Rosa Redmantle, the Flower of the Village; or, the Lost Orphan and the Galley Slave"—that's the style! They don't do the "legitimate" at our theatre, and a good job too. There's such a wicked nobleman, who poisoned his cousin ever so many years ago, and bribed the judge with a forged note for £20,000 to say he did not, and that he was the rightful heir to the estates. And now he wants to marry Rosa, who lives with her mother—a poor old widow, who cannot pay her rent—and says he will put the brokers in by noon to-morrow if she will not listen to his suit. There's a situation! "Hold hard, Sarah; if you cry, I shall too!" "Oh! the wretch!" says Sarah; "why doesn't somebody have a broadsword combat, and kill him?" But here comes Rosa's lover, who throws a purse at the nobleman's head, and then knocks him down, and stands over him just like one of the characters a halfpenny plain and a penny coloured, and the fiddles all give a tiddle-iddle-bob together. Rosa's lover has sold himself for a galley-slave, and that's how he got the money to pay the rent; and when Rosa hears it she catches him round the neck, and then falls down, and the scene closes. There's another situation! We are all going to cry, when the funny man—we all know him, and call him Joe, and he bows to the gallery—and a comic milkmaid come on, and sing together; and then the funny man suddenly remembers that he has forgotten to deliver a letter, and when that's read it's found out that Rosa's lover is the real heir, having been carried away by the funny man's second cousin, who was in the hearthstone line, and that his having sold himself for a galley-slave goes for nothing, because he didn't have a stamped receipt for the money. So Rosa and he get married, and the wicked nobleman confesses his guilt, and is shot by six soldiers in cocked hats, who have discovered that he is the Pirate of the Alps.

There; that's my amusement. Tom seems to think it's all rubbish; but as for me, I always feel uncommonly virtuous after it, and as if I could have shot the wicked nobleman myself. It isn't so fine as Tom's books, I suppose; but I cannot understand them, and, as I said before, I like to enjoy myself in my own fashion.

This is a long letter for me to write, and Tom, seeing me look anxious, asked me what I was about; so I told him I did not see why he should have everything his own way, and that I was going to tell the Working Man what I thought about it, but that I was not quite sure about my spelling.

"Quite right, Sam," he said; "nothing like hearing both sides; and, if you like, I will look over the spelling for you."

And he did, like an out-and-out chap as he is, and here's the letter.

Fires in Bedrooms.—Most people, even many intelligent reformers, have the idea that to sleep in a cold room is good—essential to health. It is an error. It is better to have an open fire in your bedroom. The atmosphere is not only by this means constantly changed, but with the fire you will keep the window open, which will add greatly to the needed ventilation. But more than this, with the fire you will have fewer bed-clothes over you, which is a gain, as a large number of blankets not only interferes somewhat with the circulation and respiration, but prevents the escape of those gases which the skin is constantly emitting. Even furnace, or stove heat, with an open window, is better than a close, cold room.

The Workman's Hall, St. James's Back, Bristol.

BY MARY CARPENTER.

Wherever Workmen's Clubs have been most successful, it has been because they were first founded on the actual wants of the population where they have been situated, and then modified to meet those wants, without following any stereotyped plan; and where persons of higher culture have aided to supply them, without lowering the independence of those for whom they were intended, by making them the recipients of a charity, instead of fellow-workers.

As actual experience is of more value than any theories, we will now give the history of one such institution, narrated by one of those who aided in establishing it.

Among the many degraded and neglected parts of the ancient city of Bristol, is one which has long been notorious as peculiarly bad. Though surrounded on all sides by schools and various charitable institutions, and though zealous clergymen, Scripture readers, and Bible women have attempted to make an impression on the neighbouring streets, this has always been left as a sort of Slough of Despond—a sink of the wickedness of the city. The nature of the population of this district has seemed perfectly antagonistic to all improvement. It has the same peculiar features now that it had a dozen years ago, though it has somewhat risen from the barbaric condition in which it was when its inhabitants sallied forth to join the dreadful riots, some thirty-five years since; and the fact that some of the dilapidated houses have been replaced by new and better ones, has considerably improved the appearance of the place. A Ragged School, in the middle of the district, has had considerable influence in raising those who attend it; yet, when their school-days are over, many have been surrounded by their rough acquaintance, and dragged down to their level. What could be done for the district? There were insuperable difficulties in the way of religious agencies, and a feeling of the impossibility of improvement seemed to pervade all who were willing to work there. The best scholars of the Ragged School went off to Canada to escape contamination. A Working Men's Club seemed the only thing that could be tried. A visit from Mrs. Bayly, in May, 1863, inspired us with confidence; and the experience of Miss Adeline Cooper in Duck Lane, Westminster, confirmed us in the belief that St. James's Back, Bristol, might be equally improved. Strangely enough, we then noticed for the first time that there was a large unoccupied space in the same street, where had stood, a few years ago, two old houses, whose tottering state had terrified a lady friend, who was wending her way past them to the school. It had not been built upon, because it was ecclesiastical property, and was to be let on a lease of 75 years, at £25 per annum. There were still on the property eight little houses, forming a close crowded group, dignified by the name of King's Head Court; but it would be a blessing to the neighbourhood to remove them, and give a little more breathing space to the crowded population. So we determined not to think of posterity, or the loss our descendants would incur when the lease was out, but to secure the place, that we may do good in our own generation, being confident that, if we could effect the substantial improvement of this neighbourhood, our descendants would have no cause to complain of us.

A few zealous persons, who felt strongly the great need, determined to use their best endeavours to accomplish the work of erecting a Workman's Hall in St. James's Back—plain, and as inexpensive as possible, but which should contain good accommodation for simple cooking, a comfortable coffee and reading room, a bagatelle and smoking room, a lecture hall and class room, besides baths, a covered skittle alley, and a gymnasium. The plan did not meet with the sympathy among benevolent persons which had been anticipated, for they did not believe in the possibility of its success. Decent labouring men, they thought, would not go to such a neighbourhood, and the inhabitants were too low to enter such a place. But, nothing daunted, we determined to carry out our scheme; and, legal difficulties being at last overcome, and a sum of money borrowed for the erection of the building,

the interest of which would be paid as rent, we decided to commence. In the meantime, we wished to gain experience. A number of working men, several of whom had been scholars in the adjoining evening school, formed a committee with us, and warmly co-operated with us. We determined to take a small house in the neighbourhood, and there carry on operations during the winter, selling to the frequenters of our Hall coffee and soup made on the premises. Some of our committee were very zealous in keeping order and carrying out the regulations, and it speaks highly of their moral control to say, that though our little hall was frequented by some of the roughest in the neighbourhood, no damage was done to the premises, no serious *fracas* occurred, and nothing was stolen—catastrophes which do at times occur in the early days of Working Men's Clubs.

At length preparatory measures were sufficiently advanced for the laying of the foundation stone, which, in compliance with the wish of the committee, was to be a public ceremony. The Mayoress kindly consented to lay the stone, the Mayor presiding, accompanied by several of the magistrates and town councillors. A platform was tastefully decorated for the occasion; a temporary gallery was erected, so that about 200 children from the neighbouring Ragged School, and 60 from a certified Industrial School, might have the pleasure of remembering in later years that they had seen the laying of the first stone of their Hall. Sufficient space having been slightly boarded off for visitors, the remainder of the ground was left open to the inhabitants of the neighbourhood, who speedily filled it. The ornamental trowel, and the bottle containing the daily papers and the coins of the realm, were all prepared. In due time the expectant assembly greeted the approach of the Mayor and Mayoress in the state carriage, attended by the usual civic functionaries. It was a wonderful sight, that, in St. James's Back, such as probably never was before witnessed; it seemed an omen that at length order and civilisation were to invade the dominion of barbarism. And not less striking was it to observe many who had probably last seen these gentlemen presiding over them as judges, now standing side by side with them in friendly sympathy. So our stone was laid, July 9th, 1864. It is unnecessary to speak of all the difficulties and anxieties which occurred before our Hall was actually completed. On the 8th of March of the past year, 1865, our building was completed, and we again requested the sanction of the civic authorities to the undertaking. The Hall, though built very plainly, did certainly look, as stated in the daily papers, "a splendid new building," when contrasted with those around it. The lofty, airy rooms were well decorated for the occasion, and in them were provided various amusements, bagatelle and other games, a galvanic battery, stereoscopes, &c. &c., with music in the Lecture Hall, when the opening meeting should be concluded. The crowds that speedily filled the building were as mixed in their character as could be desired, and it was most pleasing to observe the respectable appearance and deportment of many young working men, who had been anxiously anticipating the opening of the building intended for them. Again, on this occasion, the Mayor presided, with several magistrates and leading men, and the Mayoress of this year also gave us her presence and sympathy. The Mayor opened the hall "for the comfort, improvement, and recreation of working men, especially those of the district where the Hall is situated." Many excellent addresses were made, and received by all with great interest. One who was present could not help adverting to the time, nearly twenty years ago, when in a single room in the neighbourhood the first small Ragged School in Bristol was commenced, and gathered together the neglected children, some of whom were now present as the respectable fathers of well-ordered families. That was the grain of mustard-seed from which this large tree had sprung!

Our first months after this pleasant commencement were not a little discouraging. Before a tone of propriety and good order could be established, the "roughs" took possession, as it were, of the place, and a reign of disorder was introduced which quite kept away respectable working men. From a mistaken idea of adapting the institution to the tastes of those for whom it was intended, entertainments of a low character were introduced, which threatened to reduce our Hall to a level with the very places above which we wished to raise our members; while a want of unity of command made our superintendent incapable of exercising any control, and a lavish expenditure threatened soon to embarrass us as to pecuniary means. It was found necessary to concentrate all authority in three responsible managers, who undertook the pecuniary risk, and, as whose representative, the superintendent should exercise full control. To admit persons to the Hall who were bent on disorder and vulgarity was useless; such a condition of mind not only prevented them from deriving any benefit from being there, but kept away others who would gladly have availed themselves of its advantages. These were at once made to understand that while all were freely admitted, whatever their dress or condition, order was required absolutely, and a breach of it would at once expose to exclusion from the Hall. We contented ourselves with a small number of members during the summer, that a good tone may be thoroughly established. During that time we developed our schemes for helping labouring men and their families to get better food. Good pea-soup is daily prepared, and sold at a penny per pint; it is such as persons of a higher class often eat with pleasure. Many poor mothers come and carry away in a jug two or three pennyworths for their family dinner at home, while for fourpence a dinner is provided which, it is believed, cannot be surpassed in the city for the money. Some benevolent persons have adopted the plan of giving tickets for food at the Hall instead of money, and these are highly appreciated; for a good slice of meat off a hot joint, or such soup as we make, cannot be procured in small or poor households. Care was taken, when erecting the Hall, to arrange a good cooking apparatus, and we can, therefore, execute these plans without difficulty. It is satisfactory to know that though we make the charges for food very low, the receipts from the sale of it cover the cost of preparing it, including fire and attendance, and that the money paid for admission and the hire of rooms nearly defrays the rent and other expenses, except rates and taxes, and excepting, also, the expense of lessons and extra superintendence, which a friend has undertaken for the first year. We hope, therefore, that ere long the hall may be really self-supporting. The following is our programme:—

Workman's Hall, St. James's Back, containing Lecture Room, Class Room, Library, Coffee and Reading Room, Bagatelle and Smoking Room, Skittle Alley, Gymnasium, and Baths. Admission: Daily Admission, 1d.; Weekly Subscription, 3d.; Quarterly ditto, 2s. 6d. Youths under Sixteen Years of Age not admitted. No disorderly conduct allowed on the premises. Classes for Weekly and Quarterly Subscribers only, in the Evenings. Refreshments supplied on the following terms: Dinner, 4d.; Soup, one Pint, 1d.; Cup of Tea or Cocoa, 1d.; Cup of Coffee, ½d. or 1d.; Pudding, or Fruit Pie, 1d.; Cake, or Bread and Butter, 1d.; Roll, Biscuit, or Slice of Bread, ½d.; Cold Bath, 1d.; Warm ditto, 2d. The Bristol Daily Papers and a London Daily Paper in the Coffee Room. Open to the Public: Singing Class once a week; Gymnasium twice a week. Lectures, Readings, and Musical Entertainments every Saturday or Monday Evening during the Winter. Admission to each, 1d.; Weekly and Quarterly Subscribers Free. Temperance Meetings on Wednesday Evenings at 8.30, Admission Free. Application for the Hire of Rooms for Committee or other Meetings to be made to the Superintendent, at the Workman's Hall.

And now, if a visitor goes to our Hall, on any evening, he will find in the reading-room some respectable men occupied with newspapers, while in the opposite room are some rough-looking youths, with others more quiet in deportment, playing at various games, always without gambling, while the window looks out on a long covered skittle-alley. Passing by the window of the kitchen, where refreshments may be obtained, he enters the gymnasium, where wonderful feats are being performed by many young men. On the upper floor some classes are probably going on, or a committee is being held in the library; and in the lecture-hall there may be a penny reading, or a musical entertainment, or a temperance meeting, or on Sunday evenings a religious service.

We hope that, after a time, other agencies will spring up in connection with the Hall—that the members of it will find out new wants, and be incited to fresh efforts for self-improvement. It is better that these should arise naturally, and that a spirit of self-help should be awakened. In the meantime we are thankful to perceive already so much good result, and hope that this brief sketch may encourage others to a similar effort.

The Manchester Free Library.

Passing down Deansgate, with its strange and suggestive mixture of fashionable drapery establishments, cheap clothing depôts, gin-palaces, butchers', bakers', and other shops; its crowds of pale-featured mechanics, noisy hucksters, working men's wives, and groups of individuals belonging to the never-do-well class, we suddenly turn to the right, and speedily find ourselves in front of a building which has a stately appearance compared with the maze of mean-looking dwellings which surround it, and which is known far and wide among the working men of Lancashire as the Manchester Free Library.

The history of the institution is not devoid of interest. Originally it w a Socialist Hall, but, after experiencing many vicissitudes, it degenerated into a dancing academy. Dr. John Watts, of Manchester, at this juncture, devised a scheme for converting it into—among other things—a free library and museum; but, as usual with the promoters of new schemes, he found it difficult to inspire others with the enthusiasm entertained by himself; and the whole affair would have dropped through had not the late Sir John Potter, taking up the idea at the last moment, induced the Manchester corporation to attempt the experiment of a library supported by a local rate, and open freely, with slight restrictions, to all who might choose to avail themselves of its advantages.

From the very first the institution proved a great success, the number of volumes issued in the Reference Library during the first year being no less than 61,080. This was in 1852–3. After that the number of issues gradually increased until 1858–9, when they amounted to 94,916. In the following year they sank to 78,234; rising again in subsequent years, until, in 1861–2, the number of issues was 123,836. In 1862–3 the numbers were 101,172; in 1863–4, 74,010; and in 1864–5, 83,846. The Reference Library is distinct from the Lending Library, and consists of books which are not allowed to be taken out of the institution. It is situated on the first floor of the building, and is approached by a staircase, the walls of which are covered with valuable framed engravings, and other pictures, including portraits of various local celebrities, presented to the library. The apartment in which the Reference Library is situated is of noble proportions—the books being ranged on shelves around the walls. Every accommodation in the shape of chairs, tables, and so on, is provided for the use of the readers, the majority of whom belong to the artisan class. The number of volumes belonging to this department is 35,133. Of the 83,846 readers in 1864-5, 288 were ladies and young women; 6,196 belonged to the liberal professions; 3,935 were schoolboys and students; 271 belonged to the civil and military service; the remaining 73,156 consisting principally of working men, the larger proportion of whom belonged to the cotton-manufacturing industry. Among the other handicrafts and occupations there were 1,521 mechanical engineers, 1,510 labourers, 1,820 carpenters and joiners, 2,025 mechanics, 2,035 compositors and printers, 1,504 painters and decorators, 1,055 porters, and 200 strikers and hammerers. Amongst those not strictly belonging to the artisan class were 8,436 clerks and book-keepers, and 11,200 travellers and townsmen.

On the floor above is an extensive collection of blue books and parliamentary papers. The lending library is situated on the ground floor, the apartment being also used as a news-room. The number of volumes in the lending library and its branches is 33,077. No charge whatever is made for the loan of the books, but the borrower has to procure the guarantee of two respectable ratepayers. The books can be read in the news-room, or taken home, at the option of the borrower. Tales and light reading stand first in the estimation of the readers, then come travels, biography, history, and poetry, followed by natural philosophy, political economy, theology, and science. The number of persons holding vouchers entitling them to borrow books is 10,791. There are also 17 blind readers who make use of the library for the blind, the volumes in which are printed in embossed letters. The number of visitors to the news-room averages 827 daily.

In the basement of the building are lavatories for the gratuitous use of artisans returning from their work; no books being lent out to any one whose hands are not sufficiently clean. This arrangement has conduced greatly to the comfort and convenience of the workmen-readers.

At the branch library in Hulme there are 6,941 books, the number of issues being 95,687. The average daily attendance at the news-room was 338. The Ancoats Branch contains 5,840 volumes, the number of issues being 54,335, the daily attendance at the news-room averaging 618. The Rochdale Road Branch contains 7,191 volumes, the number of issues amounting to 76,556, and the average daily attendance in the news-room, 729. Branches have also been formed, or are about to be so, at Chorlton-upon-Medlock and Ardwick.

The Political Results of Intelligence.

WITHOUT any breach of neutrality on partisan questions of politics, we may congratulate working men on the political recognition of the fitness of their class, to an additional share in the control of public affairs, which the new Government avow themselves prepared to make. The constitution of this country is representative. That is no partisan fact: it is the common doctrine of all parties of the empire. All persons in this country, whether noblemen or workmen, who occupy a house in a parliamentary borough, the annual rental of which is £10, and pay rates to which they are assessed, are eligible to vote in the election of Members of Parliament. Had the position of the working class since 1832, when this franchise was invented, kept pace with the general increase of wealth, the suffrage would be greatly extended.

Leading political economists—Mr. John Stuart Mill being the first and chief—have drawn attention to this question, but it has scarcely become even a policy of legislation as yet. Though wages have increased, circumstances have combined to increase house rents in so many places, that a comparatively small number of workmen have been raised to the class of voters. If working men, as a class, are not to be excluded from a share in the representation of the country—and both the great political parties in the State have admitted this—we think it is well that some Government has undertaken to deal with the question.

We suppose it may be taken for granted that the dignity of an enfranchised citizen is worth caring for. That it is of some social value is evident from the fact that all who have it hold it, and that disfranchisement is regarded as an indignity, and is always resisted. It being, therefore, a matter of political credit to have a voice in shaping the destiny of a nation, we congratulate the working class that the question is seriously entertained of including an additional number of them in the electoral body. It is no part of our programme to discuss the reasons of such a step, but it is within our province to take notice of the universal reason avowed for taking it. That reason is, that the working class have so advanced in intelligence, in practical good sense, in respect for law, in public spirit, and interest in public affairs, that they have claims as substantial as those possessed by the middle class thirty years ago, for taking their place in the electoral body. This much has been stated so often in Parliament and out of it, both by members of Her Majesty's Ministry and Her Majesty's Opposition, to use the parliamentary phrase, that the conviction of the fitness of a substantial portion of the people to discharge the political duties of citizens, is one of the new unanimities of our time. Undoubtedly, it is very much to the honour of the working class to have won this general recognition.

The late Lord Palmerston was so struck by the temper and endurance of the artisan class of the northern districts of England, during what was not inappropriately termed the Cotton Famine, that he was in the habit of expressing the very high admiration in which he held their political discrimination. Had they habits of organisation commensurate with their general intelligence, they need not have waited so long as they have for the action of the Government in their behalf. Those who have no alacrity for observing progress, and small motive for admitting it, and less for giving political effect to it—so they imagine—are left to arrive at favourable conclusions, and ultimately to take action upon them. Had the industrial classes the inspiration of concert, this would all be changed. Whatever position they had a fitness for and a right to, they would command means to assert. Their wish would have public force. Like a royal invitation, their just desire would assume the form of a command; and what they now receive as a gift, they would be able to assume. In the name of the dignity and sacredness of Labour, we hope the day will come when this will be the case; and we shall be proud if the influence of this Journal shall contribute to it.

In the meantime, we think the industrial classes have good reason to pride themselves on the intelligence they have acquired, and to seek to increase it, and to avail themselves of all the means placed at their disposal to this end, seeing that the amount which they already possess is counted to their credit by statesmen, and considered their highest qualification for political advancement. If to increased general intelligence—quite in their power to acquire—they add the rare, the invaluable, but almost unknown art of association, which so many suppose themselves to understand, and so few display, the future of the industrial class may be, in all honourable respects, whatever they please to make it.

Men who have Risen from the Ranks.

IV.—BERNARD PALISSY.

WE take it for granted that it does not matter to a working man where his brother was born. A true workman is not limited to national sympathies: he has more than a mere geographical respect for the genius which adorns his order—the perseverance which exalts it. Excellence is of every clime, and the universal attribute of thought. We took Abraham Lincoln for a subject of those biographical studies, because he was the first working man who ever rose to a throne without bloodshed, or lost it without a crime; we took George Stephenson, because he was the first pitman who ever had a statue; we took Ebenezer Elliott, although he was a poet; and we take Palissy the potter, although he was a Frenchman. All pursuits are sacred which are honest; all countries are one which give birth to genius.

Bernard Palissy was a true child of poverty and misfortune. After he achieved distinction it was surmised that his father might have been a petty noble; but Bernard lived so long amid poverty and suffering, that it must have been his native element, or he would have escaped from it when in his power. In our day a gentleman will pass one night as a "casual" in a workhouse; Palissy passed half his life as a "casual," and was reviled as well as starved.

He was born about 1509, in the province of Perigord, in France—in the dark and evil days of that land. He was taught the trade of a glass painter, and worker generally in painted glass. He travelled in his youth in Lower Germany, and having some knowledge of geometry, he subsisted himself by making maps of landed property and planning gardens, and anon by glass painting—his usual calling or pursuit. He settled at last at Saintes, the petty capital of Saintonge, where he married when about twenty-nine years of age. Here occurred the event that determined the bent of his genius, and the fortunes of his noble but unhappy life. He was shown an elegant cup of Italian manufacture. It was a mere earthern cup, but turned and enamelled with so much beauty, that Palissy was taken captive by its grace. He felt within himself a taste for the beautiful. He knew that he could produce graceful forms, and his whole life was from that hour devoted to the attempt.

Enamelled cups were made in Italy, but in those days glazed pottery was unknown in France, and Palissy began to discover the secret for himself. It was as though a man in these days should sit down in privacy and attempt to discover Euclid over again. Palissy took glass and earth, and all sorts of chemicals he could get at, and bought all sorts of pots he could afford, and burnt them, and mixed them, year after year, without success. He built all sorts of humble furnaces—he exhausted his resources—all in vain. He had recourse to the furnaces of a glass-house. At one time he put in the furnaces as many as 300 different compounds, all separately mixed and marked, and only one turned out with a sort of glaze upon it, which the curious potter could neither reproduce nor improve.

His family grew, and many sickened and died. Pottery was, no doubt, fatal to them, poor things! He fell into debt. His wife reproached him, and no wonder. Still he lingered over his obstinate crucible. He built himself new furnaces. He sat before them night and day. He fed the fires incessantly as they required to be constantly kept up. For a month he never had his shirt off. When his stock of wood was all gone, he tore up the palings around his house. When they were burnt, he broke up his tables and chairs. When these were consumed, he wrenched up the planks that formed the flooring of his cottage. No wonder that Madame Palissy got out of temper. All Palissy's efforts would not do. The required heat could not be raised in the furnaces. The compounds failed, the chemicals proved false—the enamel would not come. His neighbours thought him mad—and, indeed, he was not far from it. The cups and jugs he had modelled were of exquisite beauty, and the people who saw them would have bought them for their beauty's sake; but because they were not enamelled, he thought it a humiliation to sell his failures, and he broke them all.

Poor Palissy became as thin as Don Quixote. His legs were so shrunken that his stockings could not be kept up with garters. His arms resembled his modelling sticks. There were art and grace in his brain, but none in his personal appearance. His neighbours treated him as crazy, and he held down his head in the streets like a guilty thing. At length, after sixteen years of suffering and perseverance, he succeeded, and produced those wonderful specimens of graceful enamel which made him to be regarded as a great potter, and famous for ever. His family enjoyed their much-needed competence. He had for patrons the Duke de Montmorenci (High Constable of France), the Count of Marennes, the Baron de Jarnac, the Governor of Rochelle, the Count de Rochfoucault, and Queen Catherine de Medicis. Palissy removed to Paris, and for years lived at the Tuileries, where very lately, hardly a year ago, some of his furnaces were discovered, built up in a wall, if we remember rightly.

In the days when the famous "worker in earth," as he modestly termed himself, lived in Paris, he saw heretics come to miserable ends. Francis I. himself presided over the murder of six, who were bound upon a huge wheel made to revolve over a fire, through which the victims passed, and were afterwards lifted high in the air, and made to descend, until repeated scorchings burnt the cords which bound them, and they tumbled headlong into the fiery torture. In one place, in those evil days, a beautiful girl was killed naked, that vile eyes might contemplate the paling of the skin, and the whole sudden change from beauty to the ghastliness of death. Palissy was then aged, but the brave old potter adopted and stood by the Protestant religion. His workshops were gutted by a bigoted rabble. He was thrown into the prison of Bordeaux. Only his powerful Catholic friends, who loved his art, saved him from a cruel death.

He afterwards returned to Saintes, built new workshops, and pursued his favourite work. The dread massacre of St. Bartholomew occurred, and, after many changes and dangers, Palissy returned to Paris, there actually held lectures and discussions, and, notwithstanding the terror of the times, made no secret of his religious opinions. He was thrown into the Bastille. France had no second Palissy, and the fear that his death would involve the extinction of an ornamental art, saved his life. Henry III., who then reigned, used, all starched and frilled (after his fantastic manner), to visit the Bastille; and one day he held with Palissy, who was then seventy-nine years old, this discourse:—

"My good man," said the King, "you have been forty-five years in the service of the Queen, my mother, or in mine, and we have suffered you to live in your own religion amidst all the executions and massacres. Now, however, I am so pressed by the Guise party (the Catholics), and my own people, that I have been compelled, in spite of myself, to imprison you, and the two young women with you. They are to be burnt to-morrow, and you also, if you will not be converted."

"Sire," replied the old man, "you have said several times that you feel pity for me; but it is I who feel pity for you, who have said, 'I am compelled.' That is not speaking like a king. These girls and I, who have part in the kingdom of heaven—we will teach you to talk royally. The Guisarts, all your people, and yourself, cannot compel a potter to bow down to images of clay." The great potter had all the courage and dignity of genius; this was the right kingly speech.

The poor girls were burnt a few months later, and, as Mr. Henry Morley, who has written a valuable life of Palissy, records, the same year the heroic Worker in Earth, Bernard Palissy, died in the Bastille.

Fireproof Paint.—1 lb. best blacklead, 1 lb. of fine gilders' whiting, and ¼ lb. of Quarterman's patent dryer—the whole ground together finely with linseed oil, and then thinned for use with linseed oil alone, and applied like other paints. Wood thus covered will not take fire from sparks.

Origin of the Peach.—The peach was originally a poisonous almond. Its fleshy parts were used to poison arrows, and for this purpose introduced into Persia. The transplantations and cultivation, however, not only removed its poisonous qualities, but produced the delicious fruit that we now enjoy.

Art Designs

FOR USE IN TRADES AND MANUFACTURES.

DESIGN FOR A TABLE.

In former days the carpenter loved to cover his work with ornamental designs. If he undertook to make a table, he was not content to merely place a slab of wood upon four sticks. He desired something more—to produce an article which should be ornamental as well as useful. If he could not produce the proper design, he would have recourse to a painter or an architect; for in those days it was not thought beyond the province of what is termed "high art," to stoop to the composition of designs for the commonest objects of every-day use. The tables represented in our illustrations were designed by Joannes Vredman, surnamed Vriese, signifying *native of Friesland*, who flourished about the earlier part of the sixteenth century. Vredman was a poet, painter, sculptor, and architect, and was one of the most fertile artists of his epoch. The general character of the tables is in accordance with the massive style of art prevalent at the period, and affords many suggestions of which a skilful designer or art-workman might avail himself.

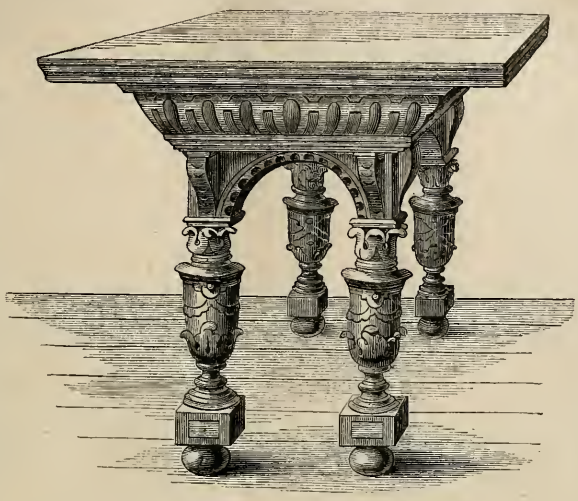

TABLE. DESIGNED BY VREDMAN. FIFTEENTH CENTURY.

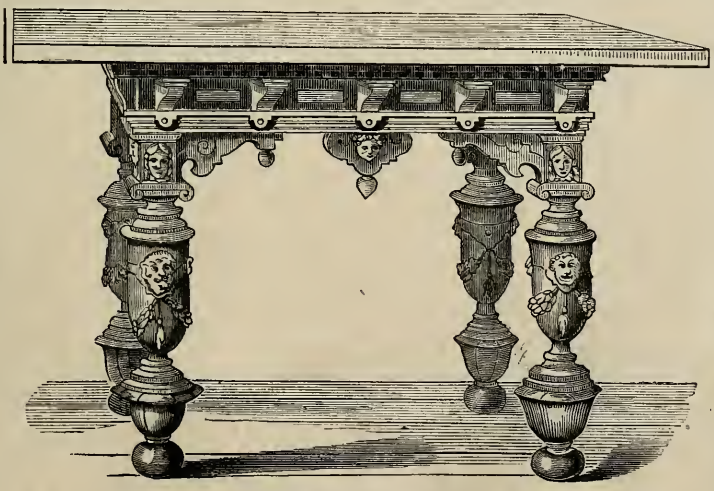

TABLE. DESIGNED BY VREDMAN.

Our Steam Marine.—There are now twenty-three steam-packet companies in this country, who own about 370 steamers, the tonnage of which is 560,000, the horse power 110,000, and the value between £30,000,000 and £40,000,000 sterling.

Letter-Carriers' Grievances.

Having paid considerable attention to the condition and movements of the "working men" belonging to that important section of the public service, the Post Office, during the last quarter of a century, we have been frequently struck with the constantly-recurring symptoms of dissatisfaction which has from time to time been manifested amongst so useful a body. Just at the present time we have a case in point. The employés—sorters, letter-carriers, and stampers—have again memorialised the Postmaster-General, under certain circumstances, for an increase of pay.

At one time, so dissimilar were the duties of the "working men" in the Post Office—so separated by the distinctions of class-rank, and so little were they regarded in relation to the duty itself, that he who wore the garb of the letter-carrier—though dressed in the Royal uniform—was not even recognised as an "officer" of the department. Nor could such a one hope to attain to any promotion out of his particular class. The weekly wage of such men for their labour was ridiculously small, the consequence being that the servant of the Post Office—recognised as such out of doors—was compelled to become dependent upon the liberality of the public. This state of things, however, has, in these instances, through the determination of the men themselves, in a great degree, passed away. These "subordinate" officers are now recognised within the Office as belonging to the establishment; the patronage of appointment is abolished; transfer from class to class, and from one office to another, is permitted; and greater opportunities of obtaining "a rise" are afforded to the members of the "minor" department.

Still, there are grievances remaining; and of these it is our intention to point out a few. The first of these arises from the singular mode in which what is termed "classification" is carried out. Officially, this removal from class to class, or from one kind of duty to another, is styled "promotion." In many instances it is not so; indeed, frequently it proves to be a change for the worse, as many of the men—whether letter-carriers, stampers, sorters, and even inspectors of the minor degree—who have tried it can testify, having proved it to be a fallacy, both in pay and prospect. "Merit," it is said, "is one of the chief grounds of promotion in the Post Office." If this so-called "merit" consists in the mere *capacity* of the officer to perform certain duties—and, in fact, it is so considered—then, indeed, a man may "catch the eye" of his superior officer; but how has it happened that "length of service" has so often been entirely overlooked in such cases? The present wages scale of the department, taken with the roll of the men, and considered jointly with their several original appointments, unmistakably proves the truth of our assertion, and scores of the men now in the service would testify to its accuracy. In the so-called "minor office" this is felt to be, as it unquestionably is, a great grievance.

The time on duty occupied by these men, too, is much more considerable than many imagine. The duties are multiform. Years gone by each man had a specific duty to perform; now, no doubt in consequence of the enormous increase of correspondence, and its almost constant arrival

and dispatch, notwithstanding the great accession of numbers of officers in the circulation department, such duties are so massed together, that it is impossible for us to describe the particular duty of any one of these "working men." The principle adopted is, that when a candidate receives an appointment as sorter, stamper, or letter-carrier (though by far the largest number are originally appointed as letter-carriers), he is expected to make himself "generally useful," as we have it in homely phrase. Hence it will be seen, that if a letter-carrier be off delivery and collecting duties out of doors, work is immediately found for him in the sorting-offices inside the dispatching-office, where he has at once to "turn to" and assist in "getting out" the constantly-received correspondence for the next "turn;" so that his distinctive character as a mere "carrier of letters" is lost, he being thus called upon to give his aid, and, in many instances, to take charge of the duty of other officers higher in rank and pay than himself, and who officially, as a matter of position, receive a greater amount of consideration than himself. In consequence, he becomes dissatisfied with the inequality engendered by the system; and, ere long, magnifies it into a real grievance, of which he considers himself, not unjustly, entitled to complain. Here is an instance: A letter-carrier has, in most cases, three "deliveries" and three "collections" of letters daily. His morning attendance at the office is at a very early hour—say, from five to six o'clock—with but few intervals of rest during the day. His deliveries and collections at night, after sorting, &c., between times, take place after eight p.m., and frequently are not finished before half-past ten, without any allowance in the shape of "extra duty" money, which at one time was the custom. This, then, and the work foreign to his vocation as a letter-carrier, constitute the "grievance."

Next, as to the payment for the services rendered. Against the *rates* of the last scale of wages authorised by the Lords of the Treasury, and signed by the Controller, "as a permanent arrangement for the minor establishments of the Post Office," we have not heard any complaints; but, though the rates themselves may be satisfactory to the men, and show well on paper, they are calculated to mislead those who do not understand their application, and seriously to affect the interests of those who are most concerned in them. The following is the scale:—"180 sorters, with wages, rising by 1s. per week, from 40s. to 50s. a week; 400 ditto, from 23s. to 28s.; 100 stampers, from 28s. to 35s.; 200 ditto, 21s. to 27s.; 330 letter-carriers, from 26s. to 30s.; 670 ditto, from 20s. to 25s.; and 100 supplementary letter-carriers, with 18s. per week wages." Now, let any one of these men ask himself the question—"How long is it likely to be before I can rise, at an increase of wages of 1s. per week per annum, from 20s. to 30s.? Of course it will be ten years; whilst, if the classification system is not fairly carried out, seeing that there are so many hundreds of my brother letter-carriers before me, it may be a much longer time, as it has been in several instances." This is a serious and painful question, constituting another grievance, and one made doubly poignant by the apparent fairness of the scale, heightened by the stern reality of its deceptiveness.

But to this document the Controller, in communicating the above decision of the Lords of the Treasury to the men, has appended a "reminder" to the effect that "the benefit of their places (the letter-carriers' especially) is by no means confined to bare wages." These benefits, as enumerated, are—"pensions granted on retirement; the fair chance of rising to the several classes above them; their fortnight's holiday on full pay; medical advice and medicines gratis; uniform clothing; gratuities at Christmas," &c. The advantages of the most part of the above are self evident; but the permitted tax upon the public in the shape of "Christmas gratuities" is not worthy of the public service. Its collection, though profitable to some of the men, is distasteful to the whole of them. It, moreover, gives rise to much internal bickering amongst the men themselves; it is an unjustifiable tax; and for many reasons ought to be immediately and for ever abolished, the recipients being duly rewarded for their official duty by moneys derived directly from the Post Office exchequer, and not from any private sources whatever. Had we space, we could point out many evils, and not a few misconceptions, as to what is called, by the official notice above given, the "money value" of the "benefits" alluded to; but we are reluctantly compelled to forbear.

At length we have reached the "Memorial of the men, and his lordship, the Postmaster-General's reply in relation to their request for more pay in consequence of the increased price of provisions, and the high charges for house and room-rent." The prayer appeared to be reasonable enough, but the answer is very unsatisfactory to the men. His lordship's reply was: "I think it is very doubtful whether it can be established that the cost of provisions, and other articles of necessary consumption, has increased of late years, with, perhaps, the exception of butchers' meat, at the present moment. Bread, tea, coffee, sugar, and other groceries, and many articles from which Excise and Customs duties have been removed, can be obtained even at a lower rate. I do not think, therefore, there are just grounds for asserting that the cost of living has materially increased, and I am not prepared to entertain this application. It is probable that house rent is higher, and I shall be glad to find that the railway companies are disposed to give the proposed accommodation of early trains, which will tend to remove the ground of complaint. I therefore entirely approve the proposed arrangements, which on every account are desirable, and will, I hope, prove advantageous to the officers of this department." Being present at the meeting on the Saturday night when the reply of his lordship was read, we were struck with the almost silent, but unmistakable marks of derision with which it was received by the numerous body of men connected with the "minor department," who assembled to hear it read by the secretary to the deputation appointed by them. No wonder that they subsequently selected seventeen other men from their united body to prepare another memorial, and generally to act as watchmen over their interests. Granting, however, that groceries may be obtained at a low cost, and even admitting, for the sake of argument, that the reductions in "Excise and Customs duties" are equivalent to the enormous increase in the prices of "butchers' meat," we cannot yet perceive how the cheap trains are likely "to prove advantageous to the officers employed in the department," the more especially if they have to pay out of their own pockets for the accommodation. As to the probability of their obtaining house and room rent cheaper in the suburbs of the metropolis when such transit accommodation is provided, we regard it as extremely unlikely, and indeed of a very doubtful character, inasmuch, as the greater the facilities furnished by the directors for the conveyance of such classes of passengers at cheap fares, and by early and late trains, the greater will be the demand for house and room lodgment, and the higher the charges in the shape of rentals must necessarily become.

It is to be hoped, however, when the railway cheap trains become so general as to "prove advantageous to the officers of the department"—as the Postmaster-General appears to anticipate so far as to "hope" they may be—that at least the weekly expenses of the travelling to and from "duty" will be allowed to them by the Office, or we shall have another "grievance" to add to our catalogue, already too far extended to augur well for the quiet of so excellent and useful a branch of the public service.

No class of public servants deserve more liberal treatment than the letter-carriers. Their duties are most arduous, and the value of their diligence and trustworthiness is certainly more immediately apparent to the public than that of any other officials. If the Postmaster-General believes that the railway companies are willing to run early trains at low fares, he might make, on the part of the Government, such arrangements for the benefit and convenience of the men as, in all probability, they would be unable to make themselves. As railway companies give no direct compensation for displacing poor people, they should be bound to give a return in another way.

We all have our wants, in whatever station of life we be. The rich, in many cases, want sympathy for the indigent; the physician, patients to swallow his pills; the mechanic, plenty of work, good spirits to do it, and prompt pay when it is done; and it is whispered that some young ladies want sweethearts—we think this may be a mistake; if it is, we will be happy to correct it.

The Temperance Question:

ITS ECONOMIC ASPECTS.*

The science of political economy, which treats of the sources and conditions of national wealth, has excited, and is still exercising, great influence over the educated and ruling classes. No longer confined to the closets of philosophers, it carries its lessons into the cabinets of statesmen, and infuses its spirit into the statutes of the realm. But it has been made a subject of complaint, that neither professors of political economy, nor its disciples in the political world, have taken a sufficiently careful view of the Temperance question in its relations to their favourite science. Many years ago—in the December of 1844—Earl Russell stated, in Exeter Hall, "I am convinced there is no cause more likely to elevate the people in every respect, whether as regards religion or political opinions, or as regards literary and moral culture, than this great question of Temperance." And from the pen of Richard Cobden, nine years later, dropped the weighty words, "Every day's experience tends more and more to confirm me in my opinion that the Temperance cause lies at the foundation of all social and political reform." How the Temperance question stands related to political economy can only be adequately apprehended by regarding it *first*, as the direct antagonist of the national intemperance; and, *secondly*, as seeking to put an end to the use and manufacture of intoxicating liquors. If we can learn how the national economy in its most comprehensive sense is affected by intemperance generally, and by the production of intoxicating liquors specifically, the bearings of the Temperance question on that economy will be readily perceived.

First, then, as to intemperance. The undoubted effect of this vice in its several developments, whether grosser or more refined, is injurious to all the economic interests of society. By the accidents and catastrophes it occasions, frequently involving enormous losses of property, it destroys many valuable fruits of labour. It hurries to a premature grave every year thousands of the producers of wealth, besides indirectly aiding to bring about the untimely decease of numberless infants and sober adults. It lays upon a sick bed myriads of workers, and not only deprives society of their skill, but too often casts them helpless upon their friends or public charity. It creates periodical indisposition to labour in large sections of many trades, and an almost chronic inability for work in not a few. It raises the pauper list three-fourths, or 75 per cent., and the crime list one-half at least, or 50 per cent.; and imposes upon the community all the costs of this pauperism and crime—some of these costs being legal, and others extra-legal. It also leads to great waste in the use of private property, to bankruptcies, and also to quarrels, by all of which the conservation and multiplication of wealth are considerably hindered. The Parliamentary Select Committee, of which Mr. Buckingham was chairman in 1834, estimated the annual loss to the country, from time and labour wasted in this vice, at not less than fifty millions per annum. The effect upon commercial affairs is often disastrous. Large orders are frequently unable to be executed with promptitude, because the men are "on the drink;" and in some establishments the tippling of a few men is sufficient to delay the completion of valuable contracts. Employers are known to complain of being heavy losers by this dissipation, while the men and their families suffer relatively still more. The whole inland trade of the nation, in short, is depressed by this vicious conduct; for what is lost in wages to the workers is lost in custom to the retail traders, and through them to the wholesale manufacturers and merchants. Nor does the economic sacrifice end here. The country loses the benefit of any inventions that might proceed from the ingenuity of sober operatives, and all that accession of capital and its productive employment which an investment of their surplus wages would ensure. Commercial co-operation among the industrial classes is a very interesting sign of the times, and since 1844 it has rapidly thriven; but all the capital so applied is a mere fraction compared with that which is annually expended in "adding drunkenness to thirst." Were intemperance to disappear, the moral tone, and intelligence of

* Continued from page 42.

society would be strikingly improved, and this improvement would in its turn react on our social economy, and would assist very powerfully in the prevention of strikes, and in putting the relations of capital and labour on a footing opposed to the feuds between them that from time to time now grievously trouble and perplex our social system. The progress of our country in wealth is unquestionably very remarkable, but it ought not to make us insensible of great drawbacks, or of the unsatisfactory influence of this progress on the condition of the working millions, or of the co-existence with our enormous wealth of a poverty and positive destitution that cast a sickly hue over all this golden glory. Intemperance accounts for a large proportion of what is low and lowering in our economic state; and at its door may be laid a loss of wealth, year by year, that, if told in coin, would not fall short of a hundred millions sterling.

Most persons admit this to be true—and how it can be denied by a reflecting mind is difficult to imagine—and some advocates of temperance are content to stop here, alleging that as their plan, if universally adopted, would prove as great an economic blessing as intemperance has proved a curse, their case is unanswerably strong. But other advocates—and among them the most able and philosophic—carry the argument still further. They affirm that, were no intoxication known, and intemperance a memory of the darker past, the manufacture and use of intoxicating liquors would still be a grave economic blunder. Whether they reason correctly, the reader must judge. Starting from the point (noticed in page 3) that inebriating liquors contain little nutriment, and that their alcoholic nature renders them injurious rather than useful or innocuous, they argue that the destruction of grain in their manufacture is a violation of economic law. About fifty millions of bushels of corn are yearly employed in British distilling and brewing, and it is calculated that from this corn, or the land that grows it, the bread supply of two millions of persons could be provided. The authority of Paley has been quoted in support of the opinion that distillation from bread-corn is commercially a crime. If, however, the corn used in making intoxicating liquors is wasted, nothing less can be said of the money paid in their purchase; and this seems to have been once the conclusion of the *Times* newspaper, when it affirmed, "It is a peculiarity of spirit-drinking, that money spent upon it is, at the best, thrown away, and in general far worse than thrown away. It neither supplies the natural wants of man, nor offers an adequate substitute for them. . . . A great portion of the harvest of many countries is applied to a purpose compared with which it would have been better that the corn had never grown, or that it had been mildewed in the ear. No way so rapid to increase the wealth of nations and the morality of society could be devised as the utter annihilation of the manufacture of ardent spirits, constituting as they do an infinite waste and an unmixed evil." In the retail purchase of intoxicating liquors, the British people expend from seventy to eighty millions a year, and from an economical stand-point—considering to what other purposes this money could be wisely applied—such an expenditure is open to the strongest condemnation, if the change from corn to alcohol is a change from aliment to none. This is worse than asking for bread and getting a stone; for the stone in this latter case, which is no food, costs several times the price of the bread which is. Supposing, too, that there is a loss of the corn, and a loss of the money spent on the liquor, other losses are included in this great economic failure. The labour used in producing the corn so destroyed is equally lost in an economic sense, and all the labour subsequently employed in making and selling intoxicating drinks must likewise count as nothing to the common good. It happens, again, that as enough corn is not grown in England to feed the population, large quantities are imported from America and other quarters; but to render such importation profitable, corn must reach a certain price at home, and the whole of this additional cost coming out of the pockets of British bread-buyers, may be considered as a bread-tax imposed by the manufacture of intoxicating liquors. It has further been ingeniously urged, that if the money now spent in drink were spent on other articles, a great impetus would be given to home manufactures, and the labour-market be healthily stimulated. This opinion is based on the fact that the value of the labour used in making intoxicating liquors is small as compared with the value of labour in other trade operations. Of £1 expended on drink, 1s. only is reckoned to reach the workman; whereas, in £1 expended on clothes, shoes, or furniture, from 6s. to 15s. goes direct to the workman. As an auxiliary consideration, this is of no mean importance.

Having thus presented the topic of Economy in its personal, domestic, and national aspects, as related to the Temperance question, we shall forbear exhortation or application. We had much rather rest in the assurance that those who read what has been written, will know how to put to profitable use the information it has conveyed.

Processes of the Arts.

PROCESS FOR SILVERING AND REPAIRING ARTICLES OF COPPER, BRASS, GERMAN SILVER, ETC., WITHOUT A GALVANIC BATTERY.—BY M. RÖSSLER.

For this object we make use of a diluted solution of double cyanide of potassium and silver, such as is usually employed in ordinary galvanic silvering. Cover with this solution the articles to be silvered, or the parts of the silvering which require to be repaired, and then immediately apply a little zinc filings, free from oxide, which is touched on with a pencil or little brush. The article thus treated, or the points where the cyanide and zinc have been applied, are immediately covered with a coating of silver—light, it is true, but durable.

It only remains to wash the article two or three times in distilled water, and dry it carefully with a piece of clean flannel. The zinc filings removed by the washings are collected and dried, and serve anew or to collect the adherent silver by treating them with diluted hydrochloric acid, which leaves the insoluble chloride of silver.

Articles of copper or brass, by simple friction with the double cyanide of silver and potassium, assume a white colour; but this silvering scarcely possesses the durability of that obtained by the process above described, for although recourse has not been had to the galvanic battery, the method is none the less based on the action of galvanic electricity.

This process is particularly applicable to the silvering of copper medals, or to articles of jewellery plated by the galvanic process, with defects in the coating. It is to be well understood that, with the first, all trace of oxide must be first removed by means of diluted hydrochloric acid, in order to obtain a thorough adherence of the silver.

By this process iron may be coppered by means of a solution of cyanide of potassium and copper, and afterwards silvered with the silver solution.

The cyanide of potassium, and silver solution containing cyanide of potassium, if allowed to touch wounds or abrasions of the skin, exercise a poisonous influence; it is therefore necessary, in the manipulations of this process, not to neglect the precautions prudence suggests in such cases. It is also necessary that all the articles placed in contact with these solutions be scraped and cleaned with the most scrupulous care.

METHOD OF RENDERING WOOD PLASTIC.

This method consists in causing diluted hydrochloric acid to penetrate the cells or pores of the wood, under a pressure of about two atmospheres. This impregnation requires to be continued a long time, varying, however, with the nature of the wood. It is not necessary to previously deprive the wood of its bark, and by means of an arrangement easily imagined, the liquid penetrates at one extremity of the tree, and flows out at the other. If the wood, while still wet, be submitted to pressure, after having washed the cellular tissue with water, its bulk may be reduced one-tenth of what it was originally. The fibres admit of being brought into close contact without cracking or breaking; and when they become dry they make no effort to separate again. If colour be injected, the details appear clear and bright, and with the most perfect exactness.

The wood thus impregnated may be turned to account in many ways. When, after it has been submitted to the action of hydrochloric acid, it is washed and dried, it can be cut with remarkable facility, and can also be employed to great advantage by carvers. The drying is effected by driving hot air (100° Fahr.) through the pores. By this means moisture is quickly expelled; and as contraction takes place equally throughout the mass, no cracking ensues. In this manner colouring matters and substances calculated to prevent dry-rot, can be introduced into the substance of the wood. Soluble glass, or recently precipitated silica, thus render wood incombustible and durable.

A NEW GAS FURNACE.

What appears to be a very useful new gas furnace has just been invented in France. Bunsen's furnaces, commonly employed in laboratories, burn a mixture of gas and air; but their heating powers are considerably limited—in fact, it is necessary to limit the supply of air to prevent the furnace cooling too rapidly. It will speedily attain a heat sufficient to melt copper, but not go much beyond. M. Ch. Schlœsing, acting upon some experiments he made with M. Demondésir, obtains with a mixture of gas and common air a temperature much higher. The principle upon which the furnace is made is "combustion, without excess of gas or air," the said combustion being made to take place in a small space. A plentiful supply of the gases is kept up, to maintain an elevated temperature, without loss through the walls of the furnace, or any other absorbents of heat. To realise these conditions, which rationally must be expected to produce the greatest calorific effect, the inventor adopts an arrangement which is in principle the reverse of that of Bunsen—that is to say, that the orifice for the admission of carburetted hydrogen is much larger than that through which the common air passes. When the mixed gases are lighted, a great blue flame is produced, the heating power of which does not appear to be much greater than in an ordinary furnace of equal size; but when the flame is forced into a refractory envelope, from which external air is excluded, then the calorific effect becomes very great. The increased heating effect is caused by the total combustion of the carburetted hydrogen, by the theoretically necessary quantity of oxygen, without the admission of useless gas. In further carrying out the principle, M. Schlœsing indicates the special arrangements most convenient to heat to whiteness tubes of porcelain and crucibles; in effect, he modifies the flame and the apparatus to suit every description of work to be performed. Like Lenoir's engine, this appears to be a valuable little arrangement for applying common gas to a useful purpose in a few minutes.

PREPARATION OF WHITE OR COLOURED MASSES OF CAOUTCHOUC AND GUTTA-PERCHA FOR THE FABRICATION OF VARIOUS OBJECTS.

The raw material, caoutchouc or gutta-percha, is cut into small pieces, and after it is washed in water, is dissolved in any of the usual solvents, such as benzole, bisulphide of carbon, or chloroform.

To produce white products, chloroform is specially recommended as the solvent, because it permits of being employed over and over again.

The solution is effected in an air-tight vessel by constantly stirring the mass, through which, after it is completely dissolved, a current of chlorine gas is passed by means of a pipe at the bottom of the vessel, until the mass is perfectly penetrated by the gas, and exhibits a uniform light-yellow colour. When the whole mass has acquired this colour, the introduction of the gas is interrupted. That which escapes at the top of the vessel is conducted by a pipe into another vessel, where it enters into a combination with lime.

The mass, now perfectly chlorinated, is conveyed from the vessel in which it was dissolved into another, where it is stirred and washed in alcohol, kneaded, and rolled out. In this state it forms a light, compact, white mass.

The same result may be obtained, but after a much longer time, when the raw material is not cut up, but merely washed and dried, and rolled between hot iron cylinders; then, thus prepared, it is conveyed into a vessel filled with water, in which, after being hermetically closed, a current of chlorine gas is admitted until the mass is saturated with it. It is allowed to remain in this vessel until it becomes of a whitish hue, then removed and dried, and it is then treated in the same manner as the first product.

The white mass obtained is dissolved anew, and stirred with a little chloroform; and, according as it is desired to be light or heavy, and of a white more or less pure, it is mixed with variable quantities of lime, calcined oyster-shells, marble, metallic oxides, barytes, clay, sulphate of lead, &c. This mixture is well kneaded, then moulded in a press into blocks or slabs of variable thicknesses and sizes, or directly into the form it is wished to give to the articles, such as buttons, handles of knives and tools, billiard balls, pianoforte keys, &c.

To prepare black or coloured masses, suitable pigments are added, and the cuttings and refuse of the manufacture are applicable to this purpose.

The white, black, or coloured masses obtained by these means may, in all cases, replace ivory, bone, horn, ebony, &c. They can be sawn, cut, turned, and polished like those materials.

COLOURED PHOTOGRAPHY ON PAPER.

The problem of the reproduction, by photography, of objects with their natural colours, has been proposed since the origin of this beautiful art. It consists in discovering one sole substance which the red rays would colour red, the yellow rays yellow, the blue rays blue, &c.

M. Edmond Becquerel has been the first to obtain, on plates of silver, the surface of which had been brought to the state violet hypochloride, a coating possessing the property of receiving impressions within the same limits of refrangibility as the retina. His magnificent copies of the solar spectrum, and of objects reproduced, with their natural colours, in the camera obscura, have excited universal admiration. M. Niepce de Saint-Victor, who has followed, with a perseverance worthy of the highest praise, the path opened by M. Edmond Becquerel, has obtained, on his part, very beautiful results, but as yet incomplete. He operated, also, upon a plate of silver; and the question was, whether they could not arrive at substituting paper for silver. Now, this is the problem which M. Poitevin, the

celebrated inventor of the charcoal process of photography, has just solved, with most unhoped-for success. After long trials, he discovered that the violet hypochloride of silver of M. Edmond Becquerel—which upon paper is only coloured very slowly and incorrectly by the rays of the sun traversing coloured glass or a transparent and coloured drawing—is, on the contrary, so modified, even for diffused light, when it has been previously covered with a solution of an alkaline bichromate, &c., that it becomes very promptly white in white light, and that it takes the colours corresponding or similar to those of the different rays which act upon it. This is his process:—To the surface of the photographic paper, previously covered with a coating of violet hypochloride of silver, he applies a liquid formed by a mixture of one volume of saturated solution of bichromate of potass, one volume of saturated solution of sulphate of copper, and one volume of solution at five per cent. of chloride of potassium. He allows it to dry, and keeps it from the action of light; and in this state it will keep good for several days. The bichromate of potass is the principal agent. It can be replaced, but without advantage, by free chromic acid, &c. The sulphate of copper facilitates the reaction, and the chloride of potassium preserves the whites which are formed.

Through paintings on glass, the exposure to direct light is only about five to six minutes: it is proportional to the greater or less transparency of the plates. This paper is not sensitive enough to be usefully employed in the camera; but, as it is, we can obtain images in colour in the apparatus for enlarging proofs, or the solar megascope.

To preserve these proofs in an album, it is sufficient to wash them in water acidulated by chromic acid, to treat them afterwards with water containing bichloride of mercury, to wash them with water saturated with nitrate of lead, and lastly, in plain, or, rather, distilled water. In this state they will not alter by exposure to diffused light, but they turn brown in the direct light of the sun.

Thus, we see that to arrive at a perfect solution of this magnificent problem is only a step—to give to M. Poitevin's paper a much greater sensitiveness, and to fix the image in a more permanent manner. The fixing of M. Poitevin's proofs is already very remarkable.

OZONE AND ELECTRICITY.

The recent experiments of M. de Luna—the disengaging of nitrous acid or ozone by the action of nitric acid on copper turnings—in the grand hall of the Society of Encouragement of Paris, furnished an occasion for a very curious observation. M. Hempel had brought his new electric machine, which gives sparks of 19·63 inches, and he was invited to put the machine in motion at the moment when the hall yet contained vapours of nitrous acid or ozone. But, to the great surprise of the experimentalist, the power of his splendid machine appeared extinct; it gave with difficulty, though with the effort of a vigorous arm, scanty and short sparks. In order to hide this default, an apology was made, assigning as a cause the excessive humidity of the warm air, saturated by the incessant respiration of the crowded auditory. The explanation was accepted. M. Hempel, however, recollected that on the preceding Saturday, at the meeting of the Scientific Association at the Imperial Observatory, in the midst of an atmosphere more humid still, and although closely surrounded by a vast number of persons, this same machine had worked in proper order, and produced without effort the longest sparks. The cause, therefore, of the impotence of the machine was to be sought elsewhere. The idea struck him that the vapours of nitrous acid or ozone might have something to do with it, and he resolved to try if it was the case. The instrument having been taken back to the workshops, he renewed the amalgam of the cushions, rubbed with hot cloths the plate of glass and the conductors, and afterwards, when it had recovered its maximum effect, disengaged, in presence of his assembled workmen, vapours of nitrous acid according to the process of the previous evening. Scarcely was the ozone perceptible before the sparks diminished in length, and when the disengagement had become sufficiently abundant, the machine had again almost entirely lost its power of producing electricity. Repeated many times before a great number of competent witnesses, the experiments always gave the same results. What is the more remarkable, it was necessary to wait until twenty-four hours had elapsed after each disengagement of nitrous acid, for the electric machine to regain its primitive energy. How can this mysterious fact be explained? Does the negative electricity essential to the ozone neutralise the positive electricity of the conductors of the machine? A young chemist and physician, M. Fels, to whom this fact was related, recollected that one day, while in the cabinet de physique of the Faculté de Besançon, a carboy containing nitrous acid having been broken, it was impossible, although the floor had been well dried and washed, to obtain sparks from an electric machine in good order; its impotence was sensible still after a lapse of six months. That is certainly an astonishing property of ozone.

Taken in connection with the recent discovery at Madrid and Paris, of the remarkable effect of the liberation of ozone in diminishing choleraic disease, the foregoing experiments are extremely interesting.

Things Talked About.

When an Emperor speaks, we suppose we are bound to listen. Napoleon III. opened the French Chambers on the 22nd, and although, of course, the main interest of his speech was connected with matters of high politics, yet there were a few sentences of special interest to our class. Everybody knows that a few months since trade strikes prevailed in France, the very place where strikes had been declared impossible. The Government, never favourable to coalitions of any kind, were probably alarmed, and instituted certain measures, which the Emperor now tells us were successful:—"The law on coalitions (strikes), which had given rise to some apprehensions, has been carried out with great impartiality on the part of the Government, and with moderation on the part of the persons concerned. The working-class, so intelligent, has understood that the more the facilities granted to it for discussing its interests, the more it was bound to respect the liberty of each and the security of all."

Co-operation, too, we are told by the same high authority, is making way in Paris, and the powers that be are highly favourable to its development:—"The inquiry which has taken place concerning co-operative societies has shown how just were the bases of the law which has been presented on this important subject. This law will permit the establishment of numerous associations for the benefit of labour and prudence. In order to favour their development, I have resolved that the authorisation required for meetings shall be granted to all those who desire, apart from politics, to deliberate in common on their industrial and commercial interests. This facility will be limited only by the guarantees which public order requires."

By a somewhat noticeable coincidence, at the very moment when the Emperor is lauding Co-operation, a letter appears from M. Ledru-Rollin on the same subject, in which the ex-tribune—who probably agrees with the Emperor in nothing else—strongly supports the principle of association.

A high authority at home—the Court of Queen's Bench—has given a decision on a question relating to strikes, which is well worthy of consideration. A number of workmen engaged in the service of a person at Nottingham, turned out on strike, being unable to come to a satisfactory arrangement with their employer on some matter of grievance. One man remained at work, and the vice-president of a Trade Union headed a deputation to the employer, and told him that unless he dismissed the man the others would not return to work. For so doing the vice-president was brought before the magistrates on a summons, convicted of using threats, and sentenced to two months' imprisonment with hard labour. Against that conviction he has unsuccessfully appealed to the Court of Queen's Bench, which has affirmed the conviction.

From the same quarter—Nottingham—we have information of a movement which may result in a diminution in the number of these unpleasant trade disputes. The Nottinghamshire and Midland Counties Merchants and Traders' Association has resolved to establish a committee of arbitration, to which difficult questions may be submitted, with a view to arrangement. It is to be hoped that the advance thus made by employers will be met in a liberal spirit. Of course, the movement is as yet one-sided, but may lead to good results.

Recurring to France, we see that the operative paper-stainers of Paris have struck work—not for increase of wages, but for reduction in the hours of labour. They now work eleven hours a day, and ask for an hour less. A curious feature in the case is, that the men signed engagements, in September last, binding themselves to work the eleven hours, and on the faith of that the masters entered into contracts, which cannot be fulfilled except by working the full time. They promise, however, to consider the matter in September next, at which time fresh arrangements are entered into for the ensuing year. Their argument appears to be reasonable; but we are sorry to see that the men, notwithstanding their engagements, have resolved to quit the shops.

While the Parisian paper-stainers consider ten hours to be a fair limit for a day's work, the house-painters of Edinburgh are striving to obtain a reduction of their hours of daily work to nine, and have formed a union for the purpose of carrying out their views.

There is an extensive strike among the potters at Bampton, near Chesterfield, where the famous salt-glazed brown earthenware is made. A thousand men have left work, the reason being that the masters, while granting an increase of pay for certain articles, excluded one particular class of earthenware known as "twelves," for which an extra fourpence a score is asked by the men. The matter in dispute appears to be one which might be easily arranged, and we hope to be soon able to report the return of the men to work on satisfactory terms.

The large class of railway servants, generally men of considerable intelligence and high character, are gradually uniting into a compact body for mutual help. A society is proposed, which is to bear the title of "The Railway Guards, Signalmen, and Switchmen's Society of the United Kingdom." The object is partly provident—for instance, the accumulation of a fund for the relief of the families of men who may lose their lives in the performance of their duty. This matter is still under discussion. The secretary reported to a meeting held a few days since, that memorials had been forwarded to the traffic managers of various lines, asking for an increase of wages, and a reduction of the hours of labour to reasonable limits. The boards of directors had replied that they declined to recognise memorials emanating from societies, but were not unwilling to listen attentively to complaints from the men in their particular employ. In consequence of this decision, memorials had been sent to the several companies, signed only by their own men, and the answers were daily expected. In the meantime, on three of the leading metropolitan lines, a great number of the men had received an increase of pay. We are very glad to hear it; for it is abundantly evident that hitherto the men, on whose activity and carefulness so very much depends, have been lamentably under-paid and over-worked.

A remarkably interesting book, "The Facts of the Cotton Famine," has just been published by Dr. John Watts, of Manchester, well known for his constant advocacy of all questions connected with the welfare of the industrial classes. His local connection with the terrible scenes of distress afforded him unusual opportunities of observing the real facts of the cotton famine; and his book is interspersed with sound reflections on many matters of interest to working men.

Mr. Bright has addressed a letter to an American friend on the subject of free trade beyond the Atlantic. The letter has been published in the *Chicago Tribune*. He propounds his opinions with all his accustomed vigour and terseness; but it is somewhat curious to find him maintaining that the working classes in this country are more prosperous than those of the United States. He says, speaking of England—"At this moment wages are higher than at any former period in this country—than in any former period, at least, within our recollection. It is so through all our manufacturing districts, although the length of the day's labour is much shorter. It is so also with our farm labourers. In many counties their wages have risen from 25 to 50 per cent. since 1846, when our agricultural industry was subjected to the competition of all the world. The labourers in America are taxed enormously in the purchase of many articles, particularly in their clothing. Americans and Englishmen going from England to America now supply themselves with clothing to last them for years: they buy it for about half the price it would cost in the States, and thus withdraw their trade from the American manufacturers, and escape the payment of the extravagant duties in the American ports." It will be strange indeed, he says, if, now that all the countries in Europe are tending to freedom of trade, America should be the last to discover its priceless value.

The final report of the commissioners appointed to inquire into the state of the Patent Office has been published. They express an opinion that the value and importance of the office has not yet been duly appreciated; and recommend that no portion of the rapidly increasing fees (now paid in the shape of stamp duties) should be appropriated to the general revenue of the country until the accommodation, expenses, and due working of every department of the Patent Office have been amply and liberally provided for.

The subject of home accommodation for the working classes has been made the subject of a very interesting discussion at a meeting of the National Association for the Promotion of Social Science. Several papers were read on the subject, and ultimately a committee was appointed to consider the suggestions, and embody them in a measure to be submitted to Parliament. The leading ideas were that freehold land and building societies might profitably undertake the work, in conjunction with municipal and corporate bodies, endowed with powers by Act of Parliament; and that boards or commissions should be formed, with power similar to those possessed by railway companies, for the compulsory surrender of suitable sites, and the removal of unfit dwellings. Mr. M'Cullagh Torrens, M.P., offered to prepare a bill, and introduce it into the House of Commons. Of course, determined opposition may be looked for, but out of the contest good may come. The directors of the Metropolitan Association for Providing Dwellings for the Working Classes have just been empowered to raise £21,000 on mortgage, for the purpose of carrying out their plans. They have already, in the various blocks of buildings, provided accommodation for 438 families.

Experiments conducted by M. Meynier, a member of the Lyons Chamber of Commerce, have resulted in the discovery that the fibre of the Chinese grass, after having been submitted to certain processes, is perfectly capable of being mixed with silk, and of taking the most delicate tints in dyeing. Various new fabrics may therefore be looked for.

The sawyers in the employ of the master shipbuilders at Great Grimsby, who had struck for an advance of wages, have, to a certain extent, re-considered their position, and expressing regret at "the rash haste with which they made their demand," have resumed work. At a meeting of the Shipbuilders' Association, it was resolved that the wages of shipwrights should be sixpence a day less for new than old work, and that no

member of the association should employ any man who could not give satisfactory reasons for leaving his last situation. This determination has greatly exasperated the men, who designate it a ticket-of-leave system, and now the whole of the shipwrights of the port are on strike.

The extreme drought in some parts of Australia has exercised a most depressing influence on the labour-market. On the Lower Murrumbidgee and the Lachlan hundreds of men were, at the date of the last advices, wandering about in the last stage of destitution. "The smaller settlers, tenant-farmers, and free selectors," we read, "find themselves face to face with ruin."

Sheep-keeping in Australia must be a wretched occupation. Half starved, miserably housed, and utterly lonely for months together, no wonder the minds of the men become affected. A shepherd on the Lower Bogan river writes to the *Melbourne Herald*:—"This solitary system is only in its infancy, but in ten years' time I shudder to think how many men's intellects will be shattered by it—my own, perhaps, amongst the rest. It is an inhuman practice, and requires the interference of Government. Why, at the present time there are enough lunatics walking up one side and down the other of the Darling River to stock an asylum on a small scale. Every year adds to the number."

There is an eight hours movement among the Scotch miners, and at a meeting held in the City Hall, Glasgow, strong resolutions were passed. There is also a short time agitation among the shipwrights and boiler-smiths of Stockton.

The Metropolitan Board of Works is anxious to be invested with the control of the commons and open spaces around the metropolis. There was a very large and influential meeting at the Mansion House on the 24th ult., in which several of the City Aldermen, Members of Parliament, and other persons of influence took part. It was shown that the legal rights of the public to open spaces, and the privileges of lords of the manor, were very ill-defined. Resolutions pledging the meeting to support the efforts of the Commons Preservation Society were unanimously passed. Energetic and immediate action is necessary. Every year sees some open tract withdrawn from the public use; and one very telling fact was noticed by Mr. Toynbee, the eminent surgeon, that 15,000 people die annually in London of lung diseases—in other words, so many were poisoned by bad air.

At a meeting of needle manufacturers held at Redditch on the 23rd ult., the question of extending the provisions of the Factory Act to that trade was considered, and referred to a committee for consideration and a report.

The shipwrights and artisans of Portsmouth Dockyard are forming a meat association on Co-operative principles, for the purpose of obtaining cheap butchers' meat.

General Information.

CLUBS AND INSTITUTES.

Leicester Working Men's Club and Institute.—This society was formed last year, after a public meeting presided over by the Mayor, and was addressed by the Rev. R. J. Allen, of St. Martin's, Leicester, Rev. H. Solly, Dr. Gutteridge, and other gentlemen. The enterprise started most hopefully, but a difference of opinion arose on the question of introducing beer into the club, which at first threatened to produce disastrous consequences. A majority of the committee had considered that it was desirable that malt liquors should be allowed in the club, but quite concurred in the propriety of submitting the question to the whole body of members. A special general meeting was, therefore, recently held, attended by nearly all the members—between 300 and 400—when it was decided against the admission of beer by an overwhelming majority. There were very few teetotallers among the number, they having for the most part stood aloof, apprehending a contrary decision. The grounds on which the men came to this conclusion were much the same as those on which a similar result has been arrived at in most other clubs; but it would occupy too much space to state them here. They are summed up in a letter written by Mr. Solly, at the request of some members of the committee, and read at the meeting. This letter has since been published as an "Occasional Paper" by the Council of the Union, and may be had at their office.

Sheffield.—A public meeting has been held, called by requisition to the Mayor, and presided over by his Worship, for the purpose of receiving the report of the Provisional Committee, appointed at a public meeting in October last, for the establishment of a Working Men's Club in that town. The report stated that, after every exertion to procure suitable premises, the committee had been disappointed in their endeavours, and they now recommended that a capital of about £5,000, in shares of £1 each, be raised among the working men of Sheffield, their friends, and the Order of Odd Fellows, and Mechanics' Institution, allowing ten weeks from that day for the purpose. The report was unanimously adopted; and after several speeches by various gentlemen and working men, the meeting, which was characterised by exceedingly hearty and earnest spirit, adjourned to the 28th of March.

Rotherham and Masbro' Working Men's Club.—A tea meeting has been held by the members of the above, in a large room at Rotherham, when about 120 of the members sat down. After tea the Rev. H. M. White, of Masbro', presided as chairman, and addresses were delivered by Messrs. Ellis, Wilkes, and Cook. Mr. Cook, in the course of his address, said that as the proposed new line of railway would involve the demolition of the building in which the meetings were now held, he did not see any reason why they should not build a Hall of their own for the district, as other clubs had done in their respective towns. He earnestly appealed for support, and proposed that the structure should be built on the limited liability principle, in £1 shares, paid by monthly instalments of 2s. 6d. He however thought that half the cost should be realised before they commenced building operations.

Halifax.—On Monday, the 15th ult., the annual distribution of prizes in connection with the Halifax School of Art, took place in the Assembly Room, on the walls of which were displayed the productions of the students. There was a large attendance, and among the gentlemen on the platform were Sir F. Crossley, M.P., Mr. Stansfeld, M.P., and the Mayor, Dr. Wightman. Mr. E. Akroyd, the president of the school, was in the chair. In the course of his speech Mr. Stansfeld said, "Art education ought to be a part of the general system of the country. They all knew that periods of moral decadence were invariably accompanied and characterised by a condition of spurious and depraved art, and he thought it was not too much to infer the converse, that an education in the principles of true, simple, refined art, must add something morally, as well as intellectually, to the status of the country. (Applause.) Lastly, as to the administration to which the report referred. He had looked into some figures on the subject, which certainly were not very encouraging. The schools of art were about 90 in number, the scholars were between 16,000 and 17,000, and of these, perhaps, 9,000 were artisans; the total amount of voluntary subscriptions was not more than £2,500 annually; and of that sum not more than one-half was subscribed by the manufacturers of the country; and the total amount of their subscriptions had rather decreased of late years than otherwise. If it was the interest not only of the family, but of the locality, and not only of the locality but of the nation, that every individual in it should receive the best possible education, the individual or his family, the locality and the nation, ought to contribute in some degree or proportion to be settled, towards the attainment of that great and common object."

Kidderminster.—We are glad to learn from its annual report, that the Committee of the Government School of Art are able to speak satisfactorily of the progress made during the past year. There has been a falling off, we observe, in the attendance on the classes for "ladies and gentlemen," and those classes have, in consequence, been necessarily closed; but while this fact is regrettable in itself, it is not of vital importance, and is compensated for by the full attendance reported in the artisan branch, and the increase in the number of school children receiving instruction through the agency of the institution. There is also a slight increase in the number of students in the employment of carpet manufacturers and designers, and to these students some stimulus has, no doubt, been given by the judicious liberality of Sir John Pakington and others in offering prizes for original designs for carpets and other subjects. Another admirable feature of the institution is the recently-added School of Science, the future utility of which may be estimated from the fact that thirty-four students, including several dyers engaged in the staple trade, have already joined the chemistry class. The finances appear to be in a healthy state, and the proceedings at the annual meeting show that considerable interest is taken in the success of the institution by those possessing the local influence necessary to assist in its progress.

Kent Association of Institutes and Clubs.—The scheme of examinations to be held in 1866 has been issued, and as our local institutions are one or two of them affiliated, it may be interesting to their members to know a little about them. These examinations are in connection with the Society of Arts, and are of two kinds, elementary and final. The elementary examinations are to be held on the 13th and 14th of March, and have a lower and higher grade, in neither of which the subjects appear formidable. The final examinations are held during the last week in April, and are open to those who have passed the higher grade of elementary examination. Prizes in books are offered to the successful candidates by the Association, varying in value from 20s. to 7s. 6d. The Society of Arts offers a large number of prizes, the highest being the Prince Consort's prize of 25 guineas, and none being of less value than £1. Such inducements should indeed prove sufficient to stimulate our young men in acquiring knowledge.

Pendleton Working People's Association.—There are few districts in which associations for the education or recreation of working men are carried on with such vigour as they are in Pendleton. On the 20th ult. the annual tea-meeting of the above-named association was held, and so great was the demand for tickets, that both the Charlestown Institution and the Pendleton Mechanics' Institution were crowded. The association was established only three years ago, but so rapid has been its growth that neither of these buildings is large enough for its operations, and for a length of time the necessity of procuring a more commodious structure has been felt. The President (Mr. W. T. Blacklock) gave an account of its operations in the past year. The number of members was 812. Ten thousand publications of a useful and instructive character, such as the *British Workman*, had been distributed to the members during the year. Tracts on household subjects, temperance, and religion had also been left weekly at 3,000 homes in the neighbourhood. In the penny bank £70 had been deposited in the year, being £13 more than in the previous year. The mothers' meetings, held weekly, had scarcely been so well attended as was desired. The night school and the winter lectures had been well attended, especially the latter. As to the financial state of the institution, those at its head set a good example, as they made it a point every year to clear off all debt. The institution would, however, be self-supporting were its benefits confined to the members, and no extraneous work done. The president, referring to the subject of erecting a Working Men's Hall for the purposes of the association, said they were very greatly indebted to the noble-minded proprietor of the Charlestown institution (Mr. B. Armitage), who, under proper conditions, had given them the use of it. (Cheers.) They, however, could not continue to use it to the extent they felt necessary, nor could they carry on the operations of the association without having a building within their own control, and one much larger. Last year he had told them that such a building would cost £800, but, on examination of plans, &c., they had found that it might be £1,200. This was a large sum, but they had a large-hearted public in Pendleton always ready to help those who helped themselves. Mr. Sugden, secretary, stated that subscriptions to the amount of £500 had been received towards the building fund. Mr. B. Armitage took the opportunity of this large assemblage to bring before them a matter in which he was personally engaged. The place in which they were met had been built with great expectations of usefulness. He now heard that it was the intention of the officers of this society to remove, and although sorry to part from them, he was glad that nothing less than an entire building would suit their purposes. It had struck him that their labours might be lightened to a great extent, and the results for good largely increased, were there the means of preparation through the education of the children. He was anxious to try the experiment of a day-school, and was preparing to open one and fill the room in which this meeting was assembled. The children would have the most competent teachers, and he did not think he could be charged with setting up a place in antagonism to other schools, as from statistics furnished by the Education Aid Society he found the room would not be able to hold the children in the neighbourhood who went to no school. The school would be in no sense denominational.

Great Meeting in Aldershot to Promote a Working Men's Club. — On Thursday evening, January 25th, a densely-crowded meeting of the working men of Aldershot and its neighbourhood was held in the Assembly Rooms of that town, for the purpose of hearing an address from the Rev. Henry Solly, of the Working Men's Club and Institute Union, London, on the subject of the club movement, and to take steps to form one in the town. The chair was taken by the Rev. Professor Kingsley, the author of "Westward Ho!" &c.; and on the platform were Captain Mangles, chairman of the South Western Railway Company; Captain Newcome, J.P.; Colonel Herbert, Assistant Quartermaster-General; Colonel Grahame, V.C., Commanding Royal Engineers; Rev. E. G. Rogers, M.A., principal Army Chaplain; Rev. S. C. Morgan, M.A., incumbent, and several other gentlemen, with many of the leading tradesmen of the town. Professor Kingsley, at some length, and in a most eloquent address, went into the subject which the meeting had to consider, and alluded, in terms of high commendation, to the publications issued on the movement by Mr. Solly, whose friendship, he said, he had the pleasure of enjoying; and also alluded, in similar terms, to the general work of the Working Men's Institute of London. The rev. gentleman concluded by an earnest appeal to the working men present to join this or some similar society. The Rev. H. Solly delivered an address of considerable force and eloquence, and thoroughly explained the working and objects of such clubs as that proposed, and enlarged on their admirable tendencies morally and socially. Resolutions in favour of the establishment of the club were afterwards proposed and seconded by Captain Mangles, Colonel Herbert, Rev. S. C. Morgan, Dr. Barker, and by Messrs. Bates, Bull, Flenn, and Hacker, as working men. They were warmly passed, and votes of thanks to Professor Kingsley and the Rev. Henry Solly were given amid prolonged applause. It was stated by one of the speakers that 250 working men were ready to join the club.

THE LABOUR MARKET IN THE COLONIES.

The *Sydney Morning Herald* says—"This market is more brisk, owing to the breaking up of the late severe drought. All descriptions of labourers are daily in attendance, for the present in excess of demand. Great numbers have been required for shearing, and

railway and other out-door works, and many are now ready for harvesting, just at hand. Female servants hire quickly for town or country. The current rate of wages remains as follows. With board and lodging, or hut room and rations:—Blacksmiths and carpenters, £50 to £70 per annum; married domestic and farm servants, £45 to £60 ditto; grooms, coachmen, and gardeners, £35 to £45 ditto; farm and garden labourers, £28 to £30 ditto; surveyors' men and ploughmen, £30 to £35 ditto; bushmen and rough carpenters, £35 to £40 ditto; porters and butlers, £34 to £40 ditto; shepherds and stockmen, £25 to £35 ditto; families shepherding from two to four flocks, £45 to £70 ditto; nurse and housemaids, £15 to £20 ditto; general servants, £18 to £26 ditto; cooks and laundresses, £26 to £30 ditto."

The *South Australian Register* says—"The father of Frederick the Great never begged more earnestly for 'a few tall grenadiers,' than our Crown Lands and Immigration office begs for good ploughmen and useful servant girls. Mr. Walcott, the Emigration Commissioner, writes that next to female domestic servants, agricultural labourers are the most difficult class of emigrants to obtain."

INDUSTRIAL EXHIBITIONS.

Dudley.—The inhabitants of Dudley, having successfully held an exhibition on a small scale in 1864, have determined to get up one of greater pretensions in the forthcoming summer, and to call it the Dudley and Midland Fine Arts, Scientific, and Industrial Exhibition. It is proposed to hold the exhibition in the Mechanics' Institution, and the Earl of Dudley has generously granted the use of his valuable gallery of pictures for the exhibition, and will aid the committee with his advice as to their arrangement.

Wisbeach.—The arrangements for the forthcoming Industrial Exhibition are progressing most satisfactorily. The applications from Lynn for space are nearly as numerous as those from Wisbeach.

Liverpool.—About nine months ago the members of the Working Men's Club at Liverpool resolved to "get up" an Industrial Exhibition, which was formally opened on the 22nd ult., at the Exhibition Rooms, Post-Office Place, by the borough members, Messrs. T. B. Horsfall and S. R. Graves, and the Mayor of Liverpool, John Farnworth, Esq. There are 451 exhibitors (who have also raised a guarantee fund of £189), and numerous amateur artisans. Many gentlemen have sent pictures and works of art to the exhibition, the paintings lent by one gentleman being valued at £16,000. The whole of the exhibition is insured for £30,000.

Second Working Men's Industrial Exhibition in Vienna.—The following communication has been received from Dr. Carl Helm, to whose exertions the successful introduction of Working Men's Exhibitions in Austria is mainly due:—"The favourable result of the first Working Men's Industrial Exhibition held at Vienna, in 1865, induces the special committee, with the sanction of the Imperial and Royal Board of Trade (given on the 1st December, 1865), to organise a second similar exhibition, to be held on the premises of the Imperial and Royal Horticultural Society, near the Public Park, in the months of August and September of the present year (1866)." Programmes of the proposed exhibition (in German) may be had on application to the Secretary of the Society of Arts, John Street, Adelphi, W.C.

Correspondence.

*** *We shall be happy to receive any information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

WAKEFIELD EXHIBITION.

To the Editor of the Working Man.

Sir,—In the Working Man for January 13th, in an article headed "The History of an Industrial Exhibition," the success of the Preston Exhibition is compared with that of the Wakefield one, in order to show the superiority in point of visitors at the former. As a native of Wakefield, and an exhibitor there, will you kindly allow me space for some little qualification of the statement to which I allude? One thing, I think, has been rather overlooked, in comparing the attendance at Preston with that at Wakefield—viz., the fact that the Wakefield Exhibition was open only six weeks, whilst the Preston was open eleven. The total receipts, from all sources, at Preston, amounted to £4,710; the receipts for admission alone at Wakefield were £5,429 7s. 7½d.

An important feature in the Wakefield Exhibition was the distribution of medals and certificates of merit, a large proportion of which have been awarded to amateur exhibitors. As the result of these awards, a great variety of articles produced by working men—in their leisure hours—were shown. The Preston Exhibition, on the other hand, consisted chiefly of works of art, machinery, curiosities, &c.; no prizes being offered to stimulate competition amongst working men.

I think it scarcely fair, under these circumstances, to hold up the Preston Exhibition as the most successful in the provinces, unless success is to be estimated by numbers alone.—Sir, yours respectfully, J. S. Ainley.

Preston, Jan. 19th, 1866.

INVENTIVENESS OF THE WORKING CLASSES.

To the Editor of the Working Man.

Sir,—I do not think your views of the Inventiveness of the Working Classes (as published in your excellent paper of this week) convey that sound and truthful view that, in the opinion of the writer of this letter, the subject undoubtedly demands. I should hope, therefore, that in the spirit of fair play and truthful inquiry you will, in your next, give publicity to the following remarks:—

Your lament that no mighty inventions have crowned the unquestionably laborious inventions of those connected with Industrial Exhibitions, arises from the fact that it is only those who have actually invented something permanently good and useful that know the vast gulf that lies between vain imagination and reality. To me, sir, the Industrial Exhibitions have been full of invention: I have seen in them the actual and positive germ that must have time for its full development. I think, sir, it is most deplorable that the patent for an invention should cost such a sum that makes it impossible for an inventor, if a *bonâ fide* working man, to obtain the protection of the laws of the land he lives in. I am aware that many really valuable inventions (providing that safety from downright robbery could have been guaranteed) would have appeared on the stalls of our Industrial Exhibitions. Every invention of worth to mankind at large has, in times gone by, sprung from the working man. In most cases he has had to run the risk of losing all, of being called a madman or a fool; or, when successful, he is made a hero of. These extremes are bad. A good and cheap patent would be of the greatest use to working men of talent.—I am, sir, yours obediently,

Truth.

London, Jan. 22nd, 1866.

SUNDAY EVENING LECTURES AT ST. MARTIN'S HALL.

To the Editor of the Working Man.

Sir,—Having noticed, in your last issue, a letter purporting to come from "A Bookseller's Assistant," I beg to be allowed to intrude on your valuable space, and to correct your anything but unprejudiced correspondent, who, after noticing that the lectures "will be delivered by men eminently qualified for the task"—and, indeed, I cannot see how they could be otherwise, whilst they are unanimously acknowledged as the cream of the literary and scientific world—goes on to say, "Is it right such lectures should be delivered on Sunday evenings?" Now, if your correspondent had attacked their principles instead of their reputation, and have tried fairly to prove that they were wrong, either in a theological or scientific point of view, even then he could not have asked the question with impunity; and I should advise our friend to bear in mind the saying of an old philosopher, that, "that of which we know nothing we should say nothing." And here I cannot help noticing how much your "sensitive" correspondent knows about "the scheme being an affair of cash," considering the expense of six nights' rental of so large a place as St. Martin's Hall, notwithstanding the vile imputation against those eminent gentlemen who have taken the "affair" in hand; and although, as your correspondent observes, "it is noticeable that the name of no reverend gentleman appears in the programme," there are gentlemen who hold truth not less sacred than a bishop, and who can also afford openly and fearlessly to speak it.

I agree with your correspondent that this is a question which eminently concerns working men, and I should be glad if some of your readers would discuss the principles enunciated at the lectures in a fair spirit, without being personal. Apologising for thus intruding on your valuable columns, I am, sir, yours respectfully, Robert Roberts.

35, *Augustus Street, Regent's Park,*
Jan. 22nd, 1866.

To the Editor of the Working Man.

Sir,—"A Bookseller's Assistant," in your issue of Jan. 20, cannot see that such discourses as those now being delivered at St. Martin's Hall by such gentlemen as Professor Huxley, Sir John Bowring, and Dr. Carpenter, have nothing whatever to do with the celebration of Divine service at the same moment throughout the land. Will no kind and sensible effort to instruct and improve working men, which at the same time directly advances their more material interests, by withdrawing them from the many evil influences and associations of the public-house, find favour with over-scrupulous people, but such as are conducted under the roofs of churches and the patronage of reverend gentlemen?

Many working men will profit by these discourses who would otherwise spend their Sunday evenings in public-house parlours or in reading the Sunday papers at home, even while Divine service is being celebrated throughout the land. Would your over-sensitive correspondent rather have them so than at St. Martin's Hall, hearing Divine truths in science and philosophy imparted to them by men eminently qualified for the task?

I dare say many of your readers besides myself would like to have more than an assertion that "the scheme is an affair of cash, after all." Your correspondent is certainly not very discreet in making an accusation of catch-penny-ism which implicates a host of gentlemen in whose intellectual and moral worth the highest confidence is placed. I do not think, sir, that I am over-sensitive in repelling this insinuation against their integrity and disinterestedness.

Perhaps your correspondent will inform us more fully, who are not so susceptible of jars, although we may have to pass a dozen or more gin-palaces on our way to St. Martin's Hall, of what he finds so reprehensible in these discourses, that, in his opinion, render a sanctimonious gloss of sacred music necessary to screen it.—I am, sir, your obedient servant, Mac.

Jan. 20th, 1866.

[We have received several other letters, advocating each view of this subject; but the preceding sufficiently express the opinion of the supporters of the lectures, in opposition to those persons who share the convictions of "A Bookseller's Assistant."]

THE DIFFUSION OF CO-OPERATION.

To the Editor of the Working Man.

Sir,—I have perused with much pleasure the article on "Diffusion of Co-operation" in your last issue, and sincerely hope it may have the desirable effect of drawing the attention of the industrial classes more fully to the beneficent influence of that principle on their social position. The example set us in the north of England, France, and Germany, of the extension of the principles of Co-operation to production as well as consumption, should make the workers in this vast hive of business, London, reflect on the means and opportunities that lie ready to their hand for the application of the principle to each particular trade. Manufacturing societies composed of working men, with a small capital for a start, subscribed by a weekly sum paid towards a share, would at once step into the position and profits of the trade, working employers thus gaining one round of the ladder; and, "looming in the future," can we not see the topmost step attained, and a division of the profits of labour agreed on that shall be at once just to the capitalist and the labourer? The ground is already manured: it requires but to be tilled and sown with earnestness of purpose, and, as the genial sun and the dews of heaven from the tiny seed bring forth goodly fruit and the stately tree, so may such an undertaking, however small in the beginning, foster a society whose wide-spreading branches will shelter the old age of many of us from the chilling blast of poverty, and whose fruits shall refresh the weary toiler in his struggle for domestic comfort and happiness. The large trade associations that exist and are now forming throughout the country prove the wide diffusion of that essential requirement of Co-operation—unity, and a brotherly feeling among fellow-workers. There is no doubt in my mind that these associations for the protection of trade will have a good effect upon the moral as well as the material well-being of the wage classes generally; and it behoves the Legislature of this country to recognise the great fact of their existence, by taking some measures to legalise them under certain conditions, such as provision for arbitration in the settlement of disputes with employers, &c. If we cannot go forward with the giant's stride, let us be content with the shorter step of the pigmy, taking small account of how slowly we move, so that it be in the right direction.—I am, sir, yours respectfully,

Edward Meads,
Secretary of the Co-operative Cabinet Manufacturing Society.

North-East Workmen's Club, 64, Murray Street,
New North Road, Jan. 21st, 1866.

P.S.—I should be glad to receive communications from cabinet-makers wishing to know the principles of this society.

The Birmingham Exhibition.—We have received a letter from Mr. Lucas, secretary to the Exhibition Committee, denying the statements made by Mr. Gillman, in No. 2 of the Working Man; but we conceive that the letter by Mr. Everard, published in our last number, is a complete and sufficient contradiction of the assertions made, and renders the publication in full of the Secretary's refutation superfluous.

TO CORRESPONDENTS.

A. C—ns—rh.—Your song is very creditable, but not adapted to the columns of the Working Man; it might suit a newspaper.

A Working Man.—To take out a patent, you had better employ a respectable patent agent, resident in London; first ageing what the charges for agency shall be.

B. H.—Any modern elementary treatise on locomotives will supply the information you require. If you study the principles of construction, you can readily ascertain the consequences of any part breaking or becoming displaced.

A Well-Wisher (Dublin).—The manufacture of convex watch-glasses employs the population of a small village in France or Germany, we forget which; but we shall procure the details, and publish them in this Journal.

B. F. H.—You must first make sure that your invention is original, by examining the specifications published at the Patent Office; then you can take out a provisional patent, which costs about £5. We see no other way of protecting your invention.

W. B.—We cannot undertake the responsibility of recommending any private building society.

R. Nurse.—Mr. Weil's improvements in electro-metallurgy are not patented. They are so simple in practice that it is hardly necessary for you to take any trouble to see them in operation.

A. V.—The monogram on your engraving is that of Albert Durer. Copies are by no means scarce, and can be bought for half-a-crown.

G. M.—If there is no rule in such cases, twenty-four hours afterwards would be the time allowed.

Skuttee.—At present, M. Tremeschini's lamp can be obtained only in Paris. It will probably be for sale in London.

Det.—The Working Women's College is in Queen Square, Bloomsbury. There is a writing class in operation. We shall have much pleasure in replying to any other question you may submit. You had better apply for a programme of the studies pursued at the college.

A Working Man (Pembroke Dock).—We cannot offer any opinion as to the safety of the coal company named. You must make due inquiries, and judge for yourself.

POPULAR RE-ISSUE, IN CHEAP WEEKLY NUMBERS, OF THE

"English Cyclopædia," conducted by CHARLES KNIGHT.

The wide range of subjects, together with the universality of information contained in "THE ENGLISH CYCLOPÆDIA," compared with its published price, have placed it in the foremost rank of important and cheap publications devoted to the diffusion of useful knowledge; but the total cost (*if payable in one sum*) to intending purchasers of the whole Work, neutralises in some degree the advantages of its thoroughly useful and interesting character.

A Popular Re-issue, in Cheap Weekly Numbers, will be published as follows:—

On Jan. 20—ARTS AND SCIENCES ..... 54. Nos.
On Feb. 24—BIOGRAPHY ..... 44. Nos.
On March 31—GEOGRAPHY ..... 34. Nos.
On April 28—NATURAL HISTORY ..... 34. Nos.

Each Weekly Number will contain from 16 to 24 pages, and the whole Re-issue will be completed in about three years.

SUPPLEMENTS TO EACH DIVISION,

bringing up to the most recent period every accession of knowledge connected with the rapid progress in geographical and scientific discovery, and embracing all the most desirable and important facts in regard to history and biography, and tracing in due order the changes of public affairs, either commercial, legal, or social, are in course of preparation, under the editorial superintendence of Mr. CHARLES KNIGHT. Due notice will be given of the publication of the Supplements, which will certainly not exceed the limits of one volume to each Division.

To the Members of Mechanics' and Literary and Scientific Institutions, Working Men's Clubs, and other associations for the purchase and common use of otherwise inaccessible works of research and reference, this mode of re-issue seems particularly well adapted; whilst there are doubtless many individuals who, unable to pay large sums at once, would gladly avail themselves of the opportunity, by easy payments at short intervals, of possessing so useful and extensive a work as "THE ENGLISH CYCLOPÆDIA."

Monthly Parts of each Division as it is published—for the convenience of Purchasers wishing to possess the whole Cyclopædia in less time than by the Weekly Numbers—will be issued at the end of every month; and a Volume of each Division likewise, in a neat strong cloth binding, every three or four months.

The Re-issue commences on January 20, in 54. Weekly Numbers, of the

ARTS AND SCIENCES;

Or, Fourth Division of "THE ENGLISH CYCLOPÆDIA."
Conducted by CHARLES KNIGHT.
To be followed by the other Divisions and by Supplements.

BRADBURY, EVANS, AND CO., 11, Bouverie Street, Fleet Street, E.C. [8

Just Published, price Sixpence,

An Usurious Rate of Discount often limits, and sometimes prevents, the Working Classes from obtaining that employment by which alone they can obtain bread for themselves and families. Being a REPLY to Mr. HORSMAN and others, who have asserted that since the Repeal of the Corn Laws the Working Classes cannot complain of any law injurious to their interest.

McLELLAN'S, Lambeth Leather Warehouse, 47, Lambeth Walk, S. [13

Working Men's College
BUILDING FUND.
STATEMENT BY THE COUNCIL.
45, Great Ormond Street, December, 1865.

This College was founded in 1854. The students are, for the most part, working men, and the teachers are, in general, members of the Universities and of different professions, or those who have themselves been students in the College. Its purpose was and is to unite these classes together, by associating them in the common work of teaching and learning. It provides instruction at the smallest possible cost (the teaching being almost wholly unpaid) in the subjects with which it most concerns English citizens to be acquainted, and thus tries to place a liberal education within the reach of working men.

In carrying out these objects we have had some measure of success. The number of students was, at the end of the first term, 145; it is now 509. With the increase in the number of students has come an increase in the number of classes, and for some time past we have been sorely pressed for space.

We want chiefly these things:—(1) A room or rooms for the Art Department. [No department of our College has been more successful than our Art Classes, carried on from the first under the general supervision of Mr. Ruskin.] (2) A moderate sized hall or room for general meetings, lectures, and social purposes, capable of containing some 300 or 400 persons. (3) A better room or rooms than we have now got for the Adult School. (4) A room to contain a Museum, and serve as a Natural History class-room. (5) More small rooms for classes.

A site is already provided, the ground in the rear of the house (12,000 square feet in area) being the freehold property of the College. We are advised that such a building as the one we require can be well and substantially built in a plain but good style for about £3,000 to £3,500.

Financially, the College is self-supporting. For several years, thanks to the excellent administration of our funds by a Students' Finance Committee, the income from students' fees has met our current expenditure, leaving a margin available for the reduction of our mortgage debt.

Considering the vast endowments which the benefactions of former ages have provided for the education of the people, endowments to which the wealthiest of us are the most indebted, it would be a disgrace to a wealthy metropolis like this if it were necessary to beg long at the present day for the inconsiderable sum we are now asking for. And the amount of labour and thought which is being voluntarily devoted to the undertaking, and by none more freely than by our students, affords, we think, some guarantee that we shall not misspend what may be given us. Finally, though many a single purse might well defray our needs, we may perhaps especially commend them to those who would be willing to take part in the teaching of this and other colleges if they were not prevented by professional and other avocations. Will they not share our work by helping us to develop it?—Signed, on behalf of the Council of Teachers,
F. D. MAURICE, Principal.

Contributions may be sent to the London and County Bank, Oxford Street branch ("Working Men's College Account"); to the Secretary, at the College (P. O. Orders to be payable to Thomas Shorter); or by cheques payable to the order of the Treasurer, R. B. Litchfield, Esq., 4, Hare Court, Temple, or to any member of the Council of Teachers.

Donations to the amount of £350 have already been received or promised, including, among others, the following:—

His Royal Highness the Prince of Wales...	£26	5	0
Rev. F. D. Maurice, Principal, from publication of Lectures on the Suffrage.....	100	0	0
Ditto (proceeds of delivery of the same Lectures at the College)	12	7	10
John Stuart Mill, Esq., M.P.	5	0	0
Vernon Lushington, Esq.	50	0	0
Samuel Morley, Esq.	21	0	0

Sir James Tyler, J.P.
G. H. Whalley, Esq., M.P. Peterborough.
J. Clayden, Esq., Mayor of Saffron Walden.
P. Le Neve Foster, Esq., Sec. of the Society of Arts.
J. Howard, Esq., Mayor of Bedford.

TO EXHIBITORS.

Contributions of Skilled Workmanship or Amateur Productions will be accepted from all parts of London, the Provinces, Scotland, and Ireland.

PRIZE MEDALS,

regulated in value according to the success of the undertaking, will be awarded for the most meritorious productions.

THE SALE OF ARTICLES

exhibited will be especially encouraged, and the price, if desired, may be affixed to the objects. An office will be opened in the building for the transaction of this business.

THE GREAT HALL,

the largest in London, will be fitted up for the display of industrial objects, no charge being made to exhibitors for occupying space.

SMALL WORKSHOPS, WITH AND WITHOUT STEAM POWER,

will be fitted up round the building. These will be let, under special arrangement, to persons who may desire to manufacture and sell articles during the Exhibition.

THE MINOR HALL

will be fitted up as a Picture Gallery and Fine Arts Court. Here will be exhibited, under the sanction of the Lords of the Committee of Council on Education, a series of works of art illustrative of the instruction afforded in the Government Schools of Art throughout the United Kingdom.

CONVERSAZIONI, &c.

It is contemplated to grant the use of the Lecture Hall to Trade and other Societies, for the purpose of enabling workmen to invite employers or friends to conversational meetings; also, under special conditions, to Amateur Musical Associations.

FLOWER SHOW.

Facilities will be afforded for holding a Flower Show, in connection with the various existing Amateur Horticultural Societies in the Metropolis. Early application from societies is solicited.

SCHOOLS.

It is intended to invite the whole of the school children in the Metropolis and adjacent districts to a free inspection of the Exhibition.

CHORAL SOCIETIES.

The Tonic Sol-Fa Association will give six concerts of 1,000 voices each; the children of the Bands of Hope will also occupy six evenings, 1,500 voices to sing on each occasion. Instrumental music will be performed by the Police, Volunteer, and other bands.

ART AND INDUSTRIAL UNION.

In order to facilitate the sale of articles which Exhibitors may desire to dispose of, application will be made to the Board of Trade for special authority to legalise the issue of shares in the same manner as that adopted by the various art unions now in existence.

FORMS OF APPLICATION FOR SPACE, NOW READY,

may be obtained by sending a stamped and directed envelope to the Secretary, Mr. W. J. Weeks, 7, Birchmore Terrace, Cardington Street, Hampstead Road, London, N.W.; or by application to the following

HONORARY AGENTS.

Bedford—Mr. A. Franklin, 5, Queen Street.

Prize Shilling Box of Water

COLOURS, with practical directions for use; post free, 22 stamps.

PRIZE NINEPENNY BOX OF WATER COLOURS, post free, 19 stamps. PRIZE NINEPENNY BOX OF DRAWING PENCILS, post free, 17 stamps. PENNY SUPERFINE WATER COLOURS; a sample and list, post free, 2 stamps.

No articles are Genuine unless marked JOSHUA ROGERS, 13, PAVEMENT, FINSBURY SQUARE, LONDON, where they are sold; and all Booksellers, Stationers, Colourmen, Fancy Repositories, &c. [27

City of London Working

CLASSES' INDUSTRIAL EXHIBITION.

To be held at the Guildhall, in March, 1866, under the patronage of the Right Hon. the Lord Mayor, the Corporation of the City of London, and several hundred members of the leading City Firms.

GUARANTEE FUND, £5,000.

All applications for Space must be made before February 1st, 1866. Space Forms, and all other particulars, may be obtained gratis at the offices, 7, Racquet Court, Fleet Street, or will be sent per post, by the Secretary, upon receipt of a stamped and directed envelope.

*** Manufacturers are invited to Exhibit.

It has been determined to devote the surplus funds to the establishment of a Free Public Library for the City.

William Ramsey, *Hon. Sec.*
John Robert Whorlow, *Secretary.* [28

£400 without Interest for

TEN YEARS. Fourth Camden Co-operative Building Society, Camden Hall, King Street, Camden Town. Weekly Subscriptions 1s. per share, every Wednesday evening. 500 Shares already issued. Rules 4d. No entrance fee. The First Subscription Meeting, January 31.

H. Hirsr, Secretary, 28, Spencer Street, Goswell Road. [29

Perpetual Investment and

BUILDING SOCIETY,
37, NEW BRIDGE STREET, LONDON, E.C.

MONEY,

In large or small sums, ready to be advanced upon security of Freehold, Copyhold, and Leasehold Property, repayable either in one sum or by periodical instalments. The amount advanced since May, 1861, exceeds

HALF A MILLION STERLING.

Prospectus and Forms of Application may be had on application, or will be sent by post. Apply to

JOHN EDWARD TRESIDDER, Secretary. [30

A Pint of Good Family Hair

WASH FOR SIXPENCE!!!

Ingredients for the above sent free, on receipt of Six Stamps, by H. Lloyd, Manufacturing Chemist, Dawlish. [31

Benson's Silver Watch,

Warranted Accurate, Two Guineas.

BENSON'S LONDON-MADE SILVER LEVER WATCH, Warranted Accurate, Four Guineas.

BENSON'S LADY'S GOLD WATCH, Warranted Accurate, Five Guineas.

Safe by Post to all parts of the World.

BRANCH ESTABLISHMENTS:

99, WESTBOURNE GROVE, 164, TOTTENHAM COURT ROAD.

STEAM WATCH AND CLOCK WORKS, LUDGATE HILL. [32

Atkinson and Co. have

added the HOUSE AGENCY to their General Furnishing Business, and they will be happy to receive the instructions of their friends who want to let or desire to take houses.

This branch will be conducted on the same fair and liberal system for which Atkinson and Co. have been long distinguished.

ATKINSON AND CO.,
198, 200, 202, 204, 206, 208, and 210, Westminster Bridge Road. [33

Picture Frames for the

CHILDREN IN THE WOOD, given with the *Illustrated London News.* Handsome gilt frames, glass, and back, 3s.; by the dozen, 2s. 6d. Maple and gilt, 5s.; by the dozen, 4s. Every description of Prints and Frames kept in stock. The Trade and Country Dealers supplied with maple and gilt Mouldings at the lowest prices. List of prices, 2 stamps, at George Rees, 57, Drury Lane (near the Theatre). [34

National Institution for

DISEASES OF THE SKIN, 10, Mitre Street, Aldgate. Physician, Dr. Barr Meadows, 8, Hinde Street, W. Open on Monday and Thursday Evenings from Five till Eight, and on Wednesday and Saturday Evenings from Seven till Nine. Free letters are available for necessitous applicants. THOMAS ROBINSON, *Hon. Sec.* [35

A Quarter of a Million has

been paid as Compensation for Accidents of all kinds, by the RAILWAY PASSENGERS' ASSURANCE COMPANY. An annual payment of £3 to £6 5s. secures £1,000 in case of death, or £6 per week while laid up by injury.

WILLIAM J. VIAN, Secretary.

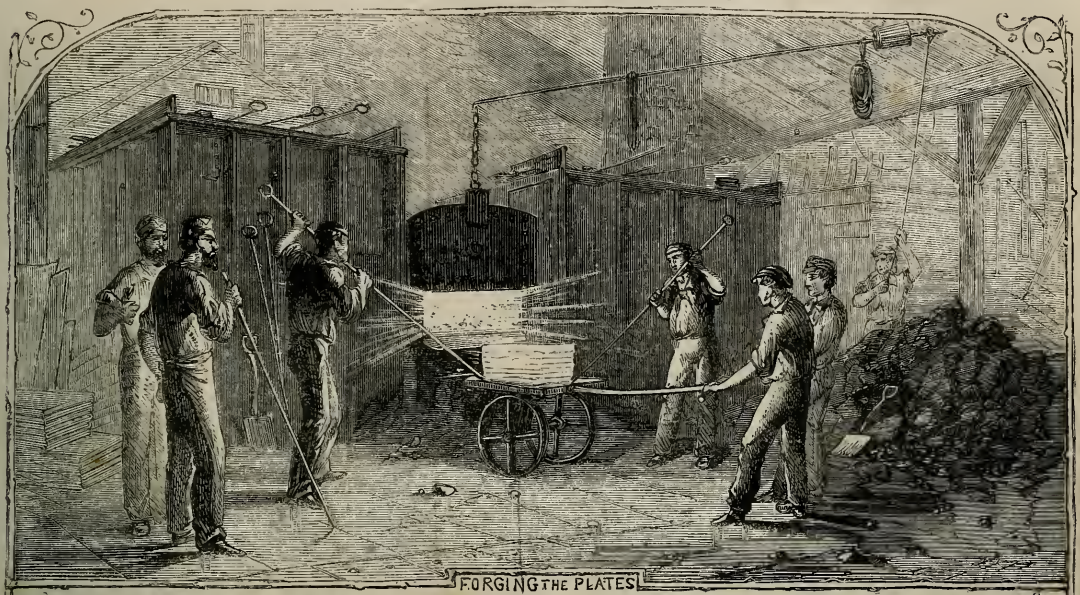
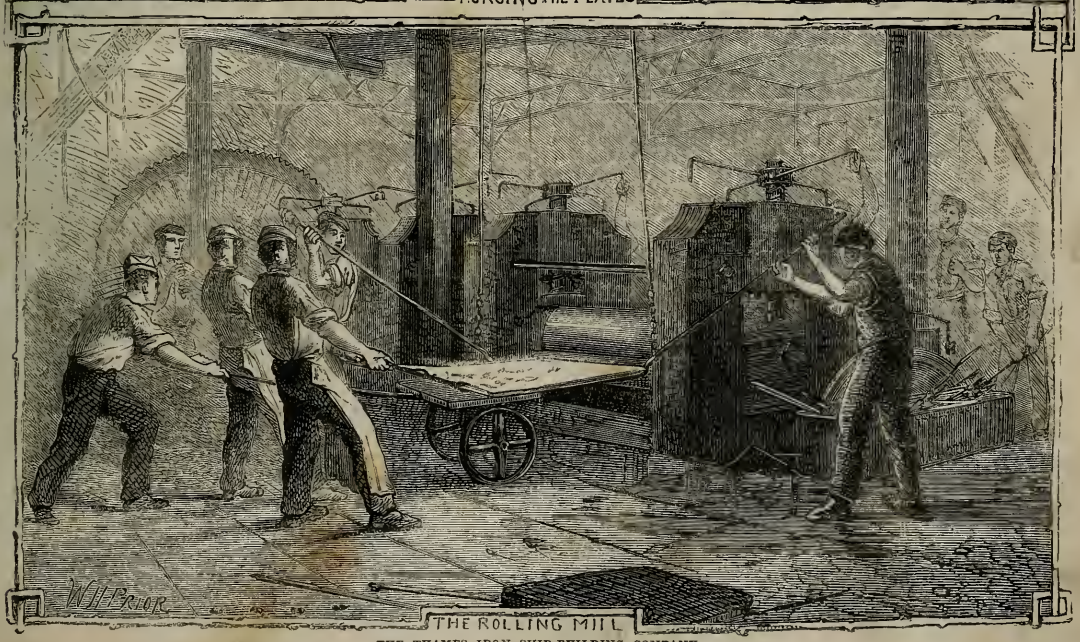
THE WORKSHOPS OF THE WORLD.





THE THAMES IRON SHIP-BUILDING COMPANY.

Iron Ship-Building.

THOSE who are old enough to remember the appearance of the various British ship-building yards during the period when the use of iron as the principal material in the construction of ships and steamboats was as yet a thing of the future, can scarcely fail to note the remarkable changes which of late years have taken place in many of these establishments. The myriads of carpenters, sawyers, caulkers, and various other artisans which the building of a wooden vessel seldom failed to call into existence, have disappeared, to be replaced by miniature armies of swart-featured, brawny-armed mechanics, furnacemen, blacksmiths, hammerers, rivetters, roller-men, and other trades, which form the rank and file of our great

iron industry. This transformation, though slow at first, was inevitable. Incredulous as ship-owners were at the beginning, it was not long before they began to perceive the advantages which iron ships possessed over those made of wood; but they certainly were not prepared suddenly to adopt the new system. Their plan was, not to supersede the wooden vessels actually in use, but rather to wait until new ships were wanted, and then to have them built of iron. But the enormous development of our commercial system, occasioned by the free-trade policy of the Government, produced an increased demand for vessels—an increase so extensive that the ship-building yards which crowded the shores of the Thames, Tyne, Mersey, Clyde, and other British rivers, could scarcely keep pace with it. Glasgow claims the honour of being the first to commence the trade of iron ship-building; but Newcastle, London, Liverpool, and the other ship-building depôts, did not lag behind their northern sister, and the construction of the *Great Eastern* caused the Thames to carry off the palm for mechanical enterprise and skill, so far as the building of iron ships was concerned. The success attendant upon the completion of the magnificent specimen of maritime architecture alluded to by us, gave a fresh impetus to the iron ship-building trade, and led to the formation of such gigantic establishments as that known as the "Thames Iron Ship-Building Company." The works of this association are situate at Blackwall, and form a prominent object to the steamboat passengers journeying to and fro between Greenwich and Woolwich. The various slips leading to the river are occupied with vessels in different stages of progress—each ship being surrounded by an intricate mass of scaffolding, which ceaselessly vibrates with the shock of the workmen's ponderous hammers, as stroke upon stroke rings upon the massive bolt-heads with which are riveted together the enormous plates used in forming the sides of the vessels. Entering the works from the land-side, the effect upon a stranger is at once startling and impressive. Look around where he will, all is bustle and activity. There are the forges hissing and rearing away as if they gloried in imparting a fiery glow to the iron; there are the rolling mills, where the stubbornness of the metal is overcome, and it is made to glide forth in sheets of the desired thickness; while in yonder range of workshops, the iron is being cut, bent, twisted, hammered, filed, and polished into almost every conceivable form and size. There may appear to be a little too much hammering; but it must be remembered that unless even the minutest portion of the maritime structure be made in a sound and workmanlike manner, the safety of the whole is endangered. A single defective bolt, or a single faulty plate, may occasion the destruction of the vessel. On the contrary, when every portion of the ship has been properly fashioned, her advantages soon become apparent. Bulk for bulk she is lighter than her wooden rival, and less liable to become arched; while in striking upon a rock, she will escape with an indentation, where a wooden vessel would be dashed to pieces. The great danger which besets an iron vessel is its liability to founder, as shown in several recent well-known cases; but this can be obviated by the use of air and water-tight compartments, several of which may be stove in without endangering the buoyancy of the ship.

The Thames Iron Ship-Building Company is one of those few associations which not only build ships, but likewise manufacture the iron used in their construction. At the Blackwall establishment the massive plates and angle-iron, of which the hulls of the ships are formed, are rolled by means of powerful machinery. There, also, the iron armour-plates, which form the coating of the ships' sides, are forged by means of gigantic steam-hammers. There are two rolling-mills, worked by machinery of enormous strength, in one of which is produced the armour-plates for the hull and sides of the ship, and in the other the various kinds of angle-iron. The process of rolling is interesting. During the time required for heating the immense mass of iron, preparatory to its being rolled into iron plates, the various lumps of iron in the glowing furnace are from time to time carefully inspected by the furnace-man, who keeps guard, like some stalwart Titan, over the fiery scene. This inspection is accomplished with the assistance of a small aperture made near the top of the furnace door, and through which he is enabled to look when required. When the iron has been made sufficiently hot, the roller-men and their assistants make their appearance, for the purpose of removing it from the furnace to the rolling-mill. This is a process as dangerous as it is grand. The metal, heated to whiteness, as it is drawn from the furnace, presents a dazzling appearance; the heat and brightness emitted being so intense as to render it a marvel that the workmen should be enabled to approach the iron so closely as they do. Indeed, the effects of the intense heat and light are considered to operate prejudicially on the health of the roller-men and furnace-men, who, as a class, are extremely steady and sober; the use of alcoholic liquors—at least, during the hours of labour—being found, from experience, to aggravate the injurious physical effects produced during the removal of the heated metal. Many of the healthiest men employed in the iron works of the kingdom are total abstainers.

The mass of iron being carried, by means of a truck, as shown in the engraving, to the mill, the process of *rolling* commences. This is a striking sight—the comparative ease and facility with which the ponderous mass of iron is managed being almost wonderful. Upwards of twelve men are generally engaged in assisting in this process. They are divided into two sets. These occupy the two sides of the rolling-mill. The first set, taking up the heated metal, place it between the rollers, which rotate at a moderate speed, and seem eager to devour it. Yielding to the powerful pressure to which it is subjected, the metal glides between the rollers, and issues, considerably reduced in thickness and converted into plate, on the other side, where it is speedily seized, with the assistance of large pincers, by the second set of workers, who pass it over the rollers to the first set of workers, by whom it is again passed through the rollers, to be again returned and rolled, until it has been reduced to the required thickness. The attitudes of the men while thus engaged in these operations are both graceful and picturesque, and our painters might find worse studies of the human figure than those to be obtained in a rolling-mill. The principal roller-men have their features covered with thick masks, for the purpose of protecting them from the heat. During the process of the first rolling, the boys in attendance are provided with birch brooms well saturated with water, with which they carefully brush the surface of the iron as it passes through the rollers, thus removing any incrustation which might be formed, the effects of such incrustation being to harden the iron, and thus retard the process of rolling. The illustrations represent the large furnace where the iron is heated, and the rolling-mill, in which it acquires the thickness to which it is destined.

At the Blackwall yard the iron is manufactured from old scrap metal, of which London is the great mart. The scrap iron, after being carefully picked, and cleansed from all extraneous substances, is piled upon a slab of wood, placed in the furnace, where it is heated to the welding point, hammered under the forge hammer, and then rolled into roughly-shaped bars. These bars are then cut into pieces of a convenient length, and a "pile" formed of the same. The pile is again heated in the furnace, again hammered, and again rolled, but this time into *angle-iron* of the required dimensions. If *plate-iron* be wanted, the original "pile" or "bloom" is rolled into a rough plate, and another pile, composed of two such plates—one for the top, the other for the bottom, of the plate to be made—with bars placed between, is heated in the furnace, and subsequently rolled into a single plate of the requisite thickness. In rolling plates, only one pair of rollers is employed. These rollers are perfect cylinders, and are made to approach or recede from each other by means of screws, as shown in our illustration. For *angle-iron*, a large number of rollers, suited to the various dimensions of the different articles, are required, the rollers being changed as often as it may be found necessary. After being subjected to the rolling process, the plate and angle-iron are taken to the *shearing machine*, where the rough ends and edges of the metal are cropped off, and each bar or plate cut to the form and size desired. They are then conveyed to the various workshops, to undergo the remaining processes necessary before they can be used for their destined purposes, and which processes we intend describing in another number.

A Possible Solution of the Dear Meat Question.

A good precept is very good, and can hardly be too much commended; but it is, after all, the practice which saves. Judging from the correspondence which has already reached us, there is a desire in more than one of the metropolitan districts to extend the practice of Co-operation. In the populous field of metropolitan life there is certainly room for a few experiments.

In one district there is something being done in the way of a Clothing Store; and a desire exists to attempt an extension of operations in the direction of a butcher's or tailor's shop. It happens that a butcher's shop is a form of Co-operation generally found to be tardy in paying profits. It does not quite appear why this should be the case. Nothing is commoner than the existence of small butchers' shops, which are manifestly self-sustaining, or they would not continue open in such numbers. If a Co-operative Store, opening a department for the sale of meat, were to do as the small butchers do—buy their joints from the wholesale carcase dealers, selecting their joints judiciously to suit their market—there is no reason why they should not make profits as well as the small retail dealers. But most young stores begin by slaughtering cattle themselves, and unless they are able to slaughter three or four animals—oxen, sheep, and pigs included—they have not variety enough for their miscellaneous customers; and if a young store provides the due variety of joints, there is fear that they may not have customers for all; and as meat will not keep, like leather and cloth, the butchering department of a young store often comes to grief. If, however, the directors of the society are sensible fellows, they look out for a friendly carcase butcher, who will accommodate them as to quantity and variety; then they are sure to make a profit. A sharp-eyed butcher can tell what the co-operators can sell, as to quantity, quality, and variety of joints, the moment he sees the neighbourhood where the store-shop is situated. He can tell this much better than the directors can. In business, an ounce of practice is worth a pound of speculation. A practical butcher, though he may neither be a statistician nor a mathematician—although he may never have heard of Nelson nor De Morgan—can calculate, at a glance over a neighbourhood, what appetites the inhabitants have, what joints they will prefer, and how much a pound they will be willing to pay for what they want.

If the object were to go into meat selling on a large scale, and establish a Co-operative Meat Society, a different course would require to be pursued. We should say that in no department of provision selling is there so wide and favourable a field open at this time in London as for the sale of meat on Co-operative principles. Generally speaking, meat is of a very uncertain quality, but of by no means uncertain price. It may not be good meat you buy, but it is sure to be at a good price. Now, a large Co-operative Society, which guaranteed Londoners good meat, would be believed, and they could fulfil their promise, and command the best customers of the whole metropolis. There is, in all conscience, scope enough for improvement, both in killing cattle and for taste in displaying meat. Butchering is one of the barbarous arts which yet remain disfiguring our civilisation, and presenting a reproach to common humanity. There is scarcely a butcher's shop in London which does not make you sick; nor a slaughter-house which does not make you shudder.

Among the eminent friends of Co-operation in England, one of the most distinguished—Professor Francis William Newman—condescended to take interest in the celebration of the opening of the great Halifax Industrial Society's Buildings, in the hope of inducing the co-operators to commence improvements in the modes of slaughtering animals. Dr. M'Cormac has demonstrated that cattle might all be slaughtered without pain, and with great advantage to succulency of the meat. As much as twenty per cent. in the weight of the saleable meat would be gained by the process, besides an increase in nutriment. Humanity and economy both recommend the improvement, but as yet no great store, nor, indeed, any small store, has ventured upon the change. Who would care for Co-operation if it proves to be as

sluggish at improvement, or as timid about change, as ordinary competition? No gentleman nor workman of humanity can relish a mutton chop or a beefsteak, if he once happens to reflect upon the horrid way in which it has come to him through the butcher's hands. Nobody ventures to refer to the process in the household, or the natural sensibility of women would be painfully shocked by the thought. Butchers generally are not given to philosophic reflection or scientific experiments, and few of them can be expected to commence an improvement in this respect. Even those who have been made sensible of its practicability and of its economic advantages, are afraid to attempt the experiment, lest ignorant customers should take alarm, and fear to eat the meat. But co-operators who turn butchers have a terror of the trade, and mostly shrink from it. One would think that they would turn with eagerness to an improvement which at once saved their feelings and doubled their profits. But no one can fathom the dense stolidity of English prejudice. The people cling to an old way, even when they see it to be a barbarous and brutal way. Any one would say that the hard-living, hearty, robust-minded Lancashire or Yorkshire workman would not hesitate to adopt an improvement in diet, although it was new; yet, as an Oxford proclamation puts it, "so it is."

Now, a public Co-operative Company could accomplish the change needed by a stroke of audacity, and make a profit by their courage. A prospectus which proposed to kill cattle on the new system would attract more attention than Dr. Dauglish's system of aërated bread. Public intelligence and cultivation are ripe for the change. The press would support it. The opinion of eminent medical authorities could at once be obtained, which would satisfy the dietetic scruples of the most uninformed of the public. The company could erect new *abattoirs*, such as England has never seen, and such as Napoleon I. never dreamt of, who was the first monarch who attempted improvement in this matter. The press would give publicity to so great and creditable a change; for nearly all the sanitary nuisance of slaughter-houses is occasioned by the present vile and wasteful modes of killing. The company, like two of the great co-operative stores of the north, and, indeed, several minor ones in the midland counties, could rear their own cattle, and co-operative cattle might be an improved breed, as co-operative houses will one day be of an improved style. There is great room for improvement in cattle-breeding for the market, over that kind which the ignorant prejudice of butchers now keeps up. The carts of the Co-operative Meat Company might be seen all over the metropolis in two years, and if the profits of the company were divisible on purchases, as in the ordinary co-operative stores, the custom would be immense, the profits unexampled, and the public good accomplished incalculable.

In these days of Bread Companies, Milk Companies, and Liebig Essence of Beef Companies, it is wonderful that there is no Co-operative Meat Company. Every year the consumption of meat is becoming an enlarging item in every family—thanks to Free Trade, to Mr. Gladstone, and the increasing prosperity of the working classes. It is quite time a great Co-operative Meat Company took the field in London. It would soon solve the vexed question of dear and diseased meat, and set an example that might be followed in every town in the kingdom with immense advantage to the whole working-class population. Are there no young noblemen of public spirit and social sympathy to set the thing on foot, if men of business do not move in it? Mr. E. O. Greening, Dr. Watts, and Mr. Max Kyllmann could accomplish such a benefit for Manchester. We could name other persons in other towns who could do the same thing were their attention called to it. London ought to possess persons capable of this. The Leeds Flour Mill is computed to save the working classes of Leeds many thousands a year in the price of their flour, they having paid much less for long years than they would have had to pay had there been no Co-operative Flour Mill in Leeds. A Co-operative Meat Mill, or rather Meat Distributing Store, would soon save the working classes of London annually a sum tenfold that which Leeds has saved in cost of flour. Really, as despairing politicians used to say to Lord Melbourne, "something ought to be done."

History of the Working Men's College,

45, GREAT ORMOND STREET, QUEEN'S SQUARE, LONDON.

BY WILLIAM ROSSITER, SENIOR FELLOW.

III.—THE ORGANISATION AND SOCIAL LIFE OF THE COLLEGE.

Our College opened in 1854 with 130 students; it has now 400. It began with a small house in Red Lion Square; it has now a large one in Great Ormond Street, and is collecting funds towards building a large hall for its general meetings, and a studio, worthy of the name, for its drawing classes. It began with twelve classes; it has now forty; and, in addition, an evening school of 50 men; three vocal music classes, with 130 members; three companies of a rifle corps, numbering 120 men; and a registered benefit society.

These, the results of eleven years' work, are the consequences of the College being founded on a principle that working men can understand, and value more and more as they understand it better. It appeals to them, not merely to come and learn mathematics or grammar, physical science or history, but to enter a College, to become members of a society, the objects of which are thus officially stated:—

The College was founded in 1854. The students are for the most part working men, and the teachers are in general members of the universities, and of different professions, or those who have themselves been students in the College. Its purpose is to unite these classes together, by associating them in the common work of teaching and learning. It provides instruction at the smallest possible cost (the teaching being almost wholly unpaid) in the subjects with which it most concerns English citizens to be acquainted, and thus tries to place a liberal education within the reach of working men.

The education offered by the College is thus defined to be of a twofold character: (1.) An organised system of instruction; (2.) The education of the College social life.

The organised system of instruction is divided into five departments—Art, History, Language, Mathematics, and Physical Science. These are subdivided thus:—

Art	*Drawing*, from casts and natural objects, drawing and painting from life.
	Singing: part singing from notes.
History . . .	*English:* general, constitutional, and social.
	General: ancient and modern.
Languages . .	*English, French, German, Latin, Greek,* Grammar, literature, and composition.
Mathematics .	*Pure:* algebra, geometry, trigonometry, conic sections.
	Applied: mechanics, hydrostatics, optics, astronomy.
Physical Science	*Physics:* inorganic and organic chemistry, heat, electricity, magnetism.
	Biology: vegetable and animal physiology, botany, zoology.
	Geology, including mineralogy and palæontology.

This list is put before us when we enter the College, but we are not advised to attempt all at once. On the contrary, we are specially advised to work in only one department at a time. A new man, on joining, writes his name, occupation, and address in the College Register, and pays half-a-crown. He is now one of the lowest class of College members, that of matriculated students. By attending during four terms, and passing, at the end of that time, an examination in some one subject of study (as English grammar, algebra, or botany), he enters the second class, that of certificated students.

The certificated student may next become either an associate or a scholar, or both. To be a scholar, he must have attended the College for two years, and pass a thorough examination in all the subjects of one department of the College; thus he may be a scholar in mathematics, in history, in physics, &c. &c. To be an associate, he must also have attended for two years, but his studies, instead of being confined to some one department of the College, must be extended to all the more important. Thus, besides obtaining certificates in any two subjects, he must show himself possessed of a fair knowledge of Bible history, of the history and language of his own country, and of elementary mathematics.

Thus the scholarship means extent of knowledge, the associateship breadth of education. The scholarship leads to no higher degree; the associateship is generally the stepping-stone to a Fellowship and a place on the Council. The different grades, and their relative position, are shown thus:—

Student.
|
Certificated Student.
|
Associate. — Scholar.
|
Fellow.
|
Member of Council.

The earlier grades are open to any student who can pass the requisite examinations; but the more important degrees of Fellow and Member of Council are conferred only by election on the part of the Council, who, in their choice, have more regard to "moral qualities, a capacity for teaching, and a willingness to teach," than to proficiency in study.

The governing body of the College, the Council of Teachers, consists of the founders, the regular teachers, and such students as have passed the Associate Examination and been thought worthy of election to Fellowships and the Council.

The fundamental theory of the College declares that the teachers and pupils shall form an organic body deserving the name of a college. With this in view, it was determined that social and political studies should be the primary part of its education. It has both failed and succeeded in carrying out this design. Excepting in the Sunday Bible-class, under the Principal, which has never broken down, the College has failed to establish a systematic course of human studies; but every thoughtful man among us has heard enough from our Principal on ethics, politics, and history, to make him more thoughtful—to show him that the kingdom of which he is born a subject, and the family of which he is born a member, are not only of man's making; that the laws which govern the inter-relations of men and of nations are not to be understood by a week's light reading, or enunciated, *ex cathedra*, with one's back to the fire.

We are thus enabled, on one hand, to estimate aright frothy demagogues and wordy "popular" lecturers; on the other, we are taught to regard our fellow-citizens as such, to look upon our juniors as rising members of the state. This gives a coherence to our College friendships, and a foundation for its social life, and has led, as one practical expression of it, to the formation of our Rifle Corps, the first working man's corps established.

Owing its name to its being founded especially for the education of manual workers, and from its arrangements being specially intended for them, our College, remembering also its object of uniting together the different classes of society, receives all who will sit and learn by the side of hand-workers, and be called by the name of working men.

This is the foundation of our social life—the life which distinguishes our College from evening classes or mechanics' institutes. It contains students of all classes—artists, teachers, clerks, tradesmen, artisans, shopmen. All these meet in the coffee-room, at the gymnasium, the boxing or rowing clubs, and in other scenes of our social life, on terms of perfect equality. Our two hundred head-workers mix with our two hundred hand-workers, not knowing until a man reaches some distinction in the College to which class he belongs. In this intellectual competition the hand-workers have hitherto had slightly the advantage in numbers.

The other great point in the fundamental theory of our College is that it shall be self-supporting. In this also it has both failed and succeeded. It has not entirely paid its own cost, though the fees have generally sufficed for the current expenses. We have never, until now, had to ask for money, as any want has always been at once met by the voluntary subscriptions of our own friends; and we ask now only because the increase of numbers and of classes render new buildings absolutely necessary.

But the great success of the self-supporting theory is in the spirit of work for the College that it has called out in the students, by whom the whole of the management and a great part of the teaching is carried on. Thus the College not only teaches its pupils, but trains up within itself its own teachers and managers.

The London Working Men's College is not the only one, neither was it the first. The Father College—the oldest of all—the People's College at Sheffield, was established in 1842, by an Independent minister, the Rev. R. S. Bayley, who, for several years, taught nearly all the classes himself, meeting them both morning and evening. On his leaving Sheffield, in 1848, his students (all young men) resolved to carry it on, and to keep it both self-supporting and self-governing. This they did, refusing all offered donations; and, beginning with a halfpenny candle in an ink bottle as their only apparatus, in ten years they raised in fees above £4,000, and are still at work.

The Halifax Working Men's College was first established as an evening school by Mr. Akroyd, M.P., but the foundation of the London College suggested to him the idea of further development. The number of students is some 300, besides a Young Women's Institute with 200 members, and a branch class at Copley of 50, men and women. The course of studies is practical, consisting chiefly of English and scientific subjects. The students have been very successful at the examinations of the Society of Arts, and of the Science and Art Department.

The Salford College was founded, in 1858, by Mr. D. Chadwick and others. In 1859 they raised £800 to purchase the building of the Salford Mechanics' Institute, which they re-named. This college is remarkable for its democratic government, its simplicity of arrangement, and its decided success. Its classes may be summed up as teaching English and science; so that its success is, doubtless, owing to the practical nature of its work. Its students are about 400; and, in addition, it has large day-schools for boys and girls.

The Manchester College was also founded in 1858, by Mr. Greenwood, the Principal of Owen's College, Mr. Gaskell, and others. In 1861 it was incorporated with the evening classes of Owen's College, the fees of which were reduced from £1 1s. to 15s. per session. The course of lectures comprises languages, mathematics, history, and physical science, as a preparation for the University of London. The number of students is about 300.

The Working Men's College at Ipswich was established in 1862, by Mr. Barrett and some other students of the Mechanics' Institute, helped by Dr. Christian, Mr. Ransome, and others. The foundation of this was also suggested by the example of the London College. Its number of students is 150, studying English subjects. This is the youngest, but also one of the most active, of the country colleges.

In London, besides the Working Men's College, there are the Evening Classes at King's College and the City of London College.

The King's College course comprises the subjects required for matriculation and degrees at the University of London. The fees are £1 11s. 6d. for each class for the winter session, and £1 1s. each for the summer session.

The City of London College was founded in 1861, the Metropolitan Evening Classes—founded in 1848—being incorporated into it. The number of students is large, over 800. The chief classes are in modern languages, mathematics, and English subjects. The college is liberally supported by City bankers and merchants, and its chief object is to provide for the clerks and other young men in the City a commercial education of a high character. In this it has been eminently successful. It avails itself, to a great extent, of the examination scheme of the Society of Arts.

Our London Working Men's College differs in some respects from any of these. It is in opposition or rivalry to none. Its speciality is, that it offers to its students not only the intellectual, but also the social training hitherto confined to Oxford and Cambridge. It provides education for a working man of every capacity. Whether he wants to learn his alphabet and to count, or to qualify himself for a M.A. degree, he will find what he wants—both men to help him to learn, and others to learn with him.

Loss of Life in Towns.

In the address to our readers in the first number of the Working Man, wherein we laid down our intended plan of operations, we alluded to the subject of sanitary science as one which would necessarily be included in the programme of a Journal devoted to all that pertains to the welfare of the working classes. And few topics there are of more vital importance than the consideration of matters affecting the health of the community generally. By consequence, therefore, the largest section of the community—that section, in truth, upon whose labours the well-being of all classes of society so greatly depends—has an immense concern in being fully acquainted with every particular which helps to show what causes tend to shorten the duration of human life under certain conditions, and how those causes may be removed.

Like as in all other departments of social science, it is of primary need that accurate and judicious observation be the groundwork upon which such information rests. Without care in this respect, statistics are full of openings for fallacious deduction as well as for erroneous inference.

It will be our object, therefore, to obtain from trustworthy sources — from officially accredited facts, indeed—such data as may be relied upon for all purposes. We shall "nothing extenuate, or set down aught in malice;" but, by clear and impartial treatment, we hope to vindicate the character of our subject from the charge of being dry and uninteresting, as it is commonly supposed to be.

We propose in this first article to speak of the comparative healthfulness of our principal cities and towns; leaving for subsequent consideration an examination of the influence of density of population, of occupation, and of other causes, upon their death-rate.

Great cities offer the most comprehensive means of studying the relative vitality of mankind in states often unfavourable to health, and under conditions entirely opposite to those of the pastoral age. In a country of limited area, inhabited by a race whose intelligence increases in a constant ratio with its numerical increase, the tendency of the people will be to aggregate themselves round large centres. So cities spring up with wonderful rapidity, and attract within their walls the cream of the brain and hand-force of the surrounding country: unhappily, the dregs follow, as a matter of course. The growth of some of our large towns, and the consequent decrease of our rural population, are amongst the most striking of the "curiosities of civilisation;" and the extent to which this massing of the people will further proceed is a problem perplexing enough to satisfy the profoundest thinker. Millions of men are thus abnormally placed, keeping up a perpetual contest with all the various elements which Nature brings to bear upon every instance of the infraction of her laws. Man, as originally created, breathed the pure air of heaven, and drank of the undefiled waters of the earth. Now he dwells in crowded cities, where the air is poisoned by noxious exhalations, and where water free from impurity is unobtainable. A return to the patriarchal mode of life is neither possible nor desirable; and nothing remains, therefore, but to mitigate, as far as human efforts will avail, the evils arising from the changed condition of mankind. To this end, the fullest information as to the nature and extent of those evils is necessary: leave aught to conjecture, and the result is infinite mischief at some time or other.

The past year affords ample illustration of this truth in the alarms which have troubled the inhabitants of Continental cities at the appearance of epidemic disease. Even to our own land the dreaded name of cholera has wafted, awaking vividly in our remembrance the visitations of previous years; but in place of vague rumours and exaggerated statements, we fell back upon our published figures and past experience, awaiting with calm determination the attack of an enemy whose evil power the most thoughtless among us acknowledges.

London may justly, and with honourable pride, point to the elaborate fulness of detail in which, ever since the passing of the Registration Act, the vital statistics of her mighty population have been published weekly without a single intermission—a publication conducing to the most valuable results.

It is to be hoped that the rulers of Continental cities will soon awake to the knowledge that nothing is gained by concealment, and will cause the facts which relate to their social condition to be published in a form which will admit of comparison with our own.

Until recently, indeed, London stood alone in furnishing a weekly analysis of the births and of the causes of death amongst its citizens. But at the commencement of the past year, the Registrar-General was enabled, by the aid of the local registrars, and by the co-operation of the Registrar-General of Scotland and Ireland, to give in his weekly return a statement of the births and deaths in some of the principal cities and towns of the United Kingdom. The health of these cities is a question of paramount importance. In some of them the population increases with exceeding rapidity, and in nearly all, the density rate shows already a deficiency of house accommodation which writes its own story on the mortuary records. Week by week, then, the properly constituted officers can watch the rising or falling of the sanitary barometer in their respective towns, and are thus enabled to apply themselves promptly to the suppression or mitigation of any cause operating unfavourably to the public health.

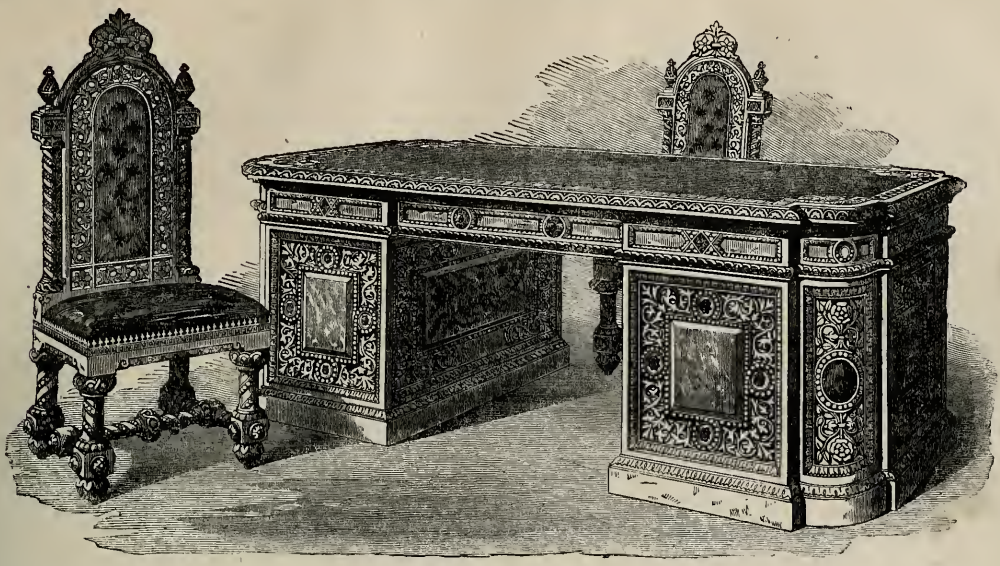
The subjoined table forcibly illustrates the variation in the death-rate under different circumstances:—

Cities and Towns.	Estimated Population in the middle of the year 1865.	Density. Persons to an Acre. 1865.	Annual Rate of Mortality. Deaths to 1,000 Persons living. 1865.
Liverpool (Borough) . .	476,368	94	36
Glasgow (City) . . .	423,723	84	33
Manchester (City) . .	354,930	79	33
Birmingham (Borough) .	327,842	42	25
Edinburgh (City) . . .	174,180	39	28
London (Registration Div.)	3,015,494	39	24
Bristol (City)	161,809	35	24
Dublin (City and Suburbs)	317,666	33	26
Hull (Borough). . . .	103,747	29	27
Salford (Borough). . .	110,833	21	29
Leeds (Borough) . . .	224,025	10	31
Total of 11 Cities, &c.	5,586,870	38	27

We have arranged the towns in the order of the density of their populations, because it may be taken as a general rule that, all other things being equal, the mortality of a town will bear a constant relation to its density rate. Thus, in Liverpool, Manchester, and Glasgow, where the mortality is so excessive, the people are packed nearly twice as closely as in the other towns. Where there is any discrepancy in this respect, it will be found almost invariably to admit of explanation. For instance, the population of the borough of Leeds is distributed over a proportionately larger area than any of the other towns, and yet its death-rate is nearly as high as the most unhealthy of them. The mass of the people are located on a comparatively small portion of the area, as is evident from the fact that in the district of Leeds (which is included in the borough) there were as many as 56 persons per acre in 1861, whilst in the remaining portion of the borough there were only two persons to an acre.

The extent to which an adequate water supply and improved sanitary arrangements are capable of removing the evils which make dense town districts so fatal, will be discussed in subsequent articles.

By way of a moral, to give additional significance to our first discourse on this subject, let us add that the deaths in 30 of the largest town districts during the ten years, 1851-60, are stated by the Registrar-General to have numbered 711,944—or at the average annual rate of 28 deaths to every 1,000 persons living in those towns. If they had experienced the same rate of mortality as prevailed in 63 of the healthiest districts of England there would have happened only 384,590 deaths; consequently, there was *an excess in the ten years of* 327,354 *deaths*, which may be justly ascribed to the unfavourable sanitary conditions in which the dwellers in towns live and die!



LIBRARY TABLE AND CHAIRS.

Art Designs

FOR USE IN TRADES AND MANUFACTURES.

LIBRARY TABLE AND CHAIRS.

The manner in which recent English and French industrial expositions have assisted in promoting the progress of our national art industries, is well exemplified by the great improvement, as regards taste and design, which characterises much of the better class of furniture at the present day. The subjoined illustration, representing a library table and chairs, affords a good proof of this. In the table, the mass of ornament with which it is covered is judiciously distributed over the surface, without becoming too prominent, or interfering with the general design of the article. Utility is not sacrificed to ornament, but the latter occupies its proper position.

Means of Education.

THE IMPERIAL POLYTECHNIC INSTITUTE OF VIENNA.

It is important that every publicity be given to the measures adopted in foreign countries for providing the means of technical education to the industrial classes. In the rivalry and competition among nations that now exists, greatly stimulated by Industrial Exhibitions, there is reason to fear that the British artisan will find himself outstripped in the race, unless prompt and energetic measures are taken to provide him with the means of obtaining scientific education on a liberal scale. The Polytechnic Institute of Vienna was established by an Imperial decree on the 17th of October last, and we think that the publication of the programme of its organisation will be useful in showing a comprehensive scheme of scientific and technical education on a par with the wants and resources of the present time. We do not anticipate that our Government will emulate that of Austria, in establishing a Polytechnic Institute. If ever such an educational establishment be founded, it will, doubtless, be through private munificence, or the co-operation of those to whom it has become indispensable.

The duty of providing the rising generation with scientific education, at the lowest possible cost to the recipient, ought not to be neglected, if it be desirable for England to maintain her supremacy in the industrial arts.

The aim of the Imperial Polytechnic Institute is to provide theoretical and practical instruction, as complete as possible, for those who are intended for an industrial career.

The course of instruction is subdivided into four groups of subjects, or special schools, viz.:—

1. Hydraulic Architecture, Roads and Bridges.—*1st Division.* Mathematics, Descriptive Geometry, Technical Physics, Mechanics, Theory of Machines, Knowledge of Materials.—*2nd Division.* Practical Geometry and Geodesy, Mechanics of Construction, Architecture (properly so called), Hydraulic Architecture, and Roads and Bridges.

2. Architecture.—*1st Division.* Mathematics, Descriptive Geometry, Technical Physics, Mechanics, Theory of Machines, Knowledge of Materials.—*2nd Division.* Practical Geometry, Mechanism of Construction, Architecture (properly so called), Hydraulic Architecture, and Roads and Bridges, History of Architecture.

3. Construction of Machines.—*1st Division.* Mathematics, Descriptive Geometry, Technical Physics, Mechanics, Practical Geometry.—*2nd Division.* General Architecture, Theory of Machines, Construction of Machines, Mechanical Technology.

4. Technical Chemistry.—Mineralogy, Botany, Zoology, General Physics, Technical Physics, General Theory of Machines, Theoretical Chemistry, Technological Chemistry, Knowledge of Commercial Products.

Auxiliary Subjects.—These include Universal History, History of the Austrian Empire, National Economy and Statistics, Commercial and Maritime Law, Legislation and Administration, History of Architecture, History of the Inductive Sciences, History of German Literature, Æsthetics, and Responsibility. Drawing and Modelling, Stenography, and the French, English, and Italian Languages are also made the subjects of special instruction.

The lectures are either *annual*, or from the 1st of October to the end of February; or from the 1st of March to the end of July. The programmes are permanent, and can only be modified by authority of the minister.

The professors of botany, geology, chemical technology and mechanics, agriculture and forest culture, topography, the construction of machines, and of objects relating to practical architecture, will take their pupils on excursions suitable for facilitating the understanding of their theoretical instruction. The professor of practical geometry will execute with his pupils a geodesical operation of some importance during the summer session.

ELECTRIC COMMUNICATION IN RAILWAY TRAINS.

M. ACHARD'S SYSTEM.

Here, as in the Achard brake, it is electricity which intervenes at the proper moment to make use of the force of the rotation of the wheels, and to dispose of it so as not to exert on the pressure-bands a force powerful enough to determine an instant slackening of speed, but to pull the wire of one or more powerful bells along the train. An excentric is fixed on one of the axle-trees of the luggage van; a lever, No. 1, the axis of which is adapted to the framework of the van, has one extremity resting on the excentric, and while the wheel revolves, receives an alternate motion. At its other extremity the lever carries a catch, playing on a ratchet-wheel, which turns a certain number of teeth for every revolution of the excentric at the other end of the lever. The ratchet-wheel carries four arms fixed beside it, which play on the end of another lever, No. 2, the centre of which is also adapted to the framework of the van, while the other end is in communication with the hammer of the bells. The first bell outside the van is of large dimensions, and is to call the attention of the driver or stoker; the second, inside the van, is to call the guard of the train. Once set ringing, the apparatus would never stop without the agency of the electric current. In order to do this, the lever No. 1 carries at its extremity near the catch two flat bars of iron, guided in their alternate vertical movement by two guides. These two bars play against the extremities of an electro-magnet with four poles. As soon as the magnet is animated by a current of electricity, it lays hold of the flat bars of iron with a force of 225 lb., and the lever, no longer touching the excentric, remains stationary; the ringing of course ceases also. To set them at work again, it suffices to interrupt the electric circuit. One great advantage of these dispositions is that all the derangements capable of interrupting the current—such as breaking of coupling links, running off the rails, fire, &c.—as soon, at least, as they affect the conductors, set the bells ringing continually till the train stops completely. Intended at first only for the officials of the train, this system of communication can, without any practical difficulty, be extended to the passengers. It is a simple question of the adaptation of interrupters to every carriage; and the time has come, as we see by the Ministerial circular, for definitely adopting the only efficacious means of preventing accidents which have so seriously occupied public attention.

THE CHOLERA AND NITROUS ACID.

We extract the following passage from a letter from M. de Luna, a celebrated Spanish chemist, dated 25th November last:—"Allow me to present you with a new work that I have just published on the subject of the *cholera morbus*, which at Madrid has so cruelly visited us. You will find compiled in it all the observations, collected by me with the greatest care, on the powerful efficacy, as disinfecting agent, of nitrous or hypoazotic acid, disengaged by the action of nitric acid upon a copper coin—an acid which is, in reality, nothing but a depôt or magazine of ozone. Wherever, by producing these penetrating vapours, the atmosphere of the rooms was strongly ozonised at the hour of rising and at bedtime, the cholera was escaped, or at least the intoxication produced by the atmospheric miasma was confined to symptoms of little gravity. The inhalation of ozonised air by nitrous acid determined, in every case where it was applied, a perfect reaction; the inhalation of oxygen ozonised by the same vapours saved many patients in the algide stage. These assiduous observations that I have made also gave evidence of the actual relation between the diminution of the quantity of ozone in the air and the intensity of the cholera, on the condition, however, that the wind blew from the south and south-west, and that the temperature did not exceed 59° Fahrenheit." What is most novel and important in this communication is the fact that nitrous acid is an abundant and energetic source of ozone or oxygen in a nascent state, always ready to oxidise animal matters, and to destroy them by oxidation. Nitrous acid has, in effect, the characteristic odour of ozone or electrised oxygen, and strongly turns brown the ozonometric paper of M. James. Our readers will notice the singular and remarkable coincidence of the employment of nitrous acid at Madrid as a preservative against the cholera, and at Paris as destroyer of the choleraic miasma in disinfecting the wards of hospitals.

Working Men's Clubs.

BY THE REV. H. SOLLY.

The task of pointing out clubs that have been successful and others that have failed, with a glance at the causes of either result, is an important duty in giving any sketch of the history of this movement, but by no means an easy one; for, with a few exceptions, the fate of each club has been a chequered one, as we might expect in the early stages of all such undertakings. Frequent mistakes are sure to be made, and very rare must be the cases in which have been found a combination of all the elements requisite to ensure success. Several large and very well-managed clubs have suffered from adverse influences or unavoidable hindrances during their career, which have retarded for a time their prosperity, or even brought them very low. Yet, both these and much smaller institutions, which have never attained any great prosperity or suffered serious check, have been effecting a large amount of good, not merely by their direct benefit to individual members, but also by the leavening influence they have been gradually exerting on the working population in the neighbourhood. The following may be mentioned as clubs that have been in highly successful operation for two or three years, and which, to the best of my knowledge, have never experienced any check in their career or diminution of their prosperity. There may be others equally entitled to such mention, but if so they have not acquainted me with their history. Those clubs that I can testify to from personal knowledge are Camden Town, Duck Lane (Westminster), Holloway, Stoke Newington, Leeds, Rotherham, Newcastle, South Shields, Sunderland, Buersill, Preston, Wednesbury, and Guildford. The Clubs at Bristol, Wolverhampton, Shoreditch (London), Stoke Newington, Essex Road (Islington), Portsmouth, Devonport, and Blandford, have also done well, and we have recently heard that one at Heywood, in Lancashire, has been uniformly very successful.

The club at Bolton had been one of the best and most flourishing, until it began to suffer from the want of a hall large enough to hold the members at their weekly entertainments. They are taking steps, however, to remedy this defect, by raising money to build a hall adjoining their spacious and capital club-house, having plenty of ground for the purpose.

The Workmen's Hall at Notting Hill, established by Mrs. Bayley, and mentioned in my previous paper as one of the first and best, suffered a serious check to its career about three years ago, partly owing to insufficient accommodation for the numerous members who flocked to it, and partly from a dispute in reference to smoking. A secession took place in consequence, and for a short time the undertaking, which had wrought incalculable blessings to the neighbourhood, threatened to prove a failure. Energetic and judicious measures, however, speedily re-established a prosperous state of things. The club, as such, was dissolved by common consent of the members, and the building was thrown open to the public without any charge, the current expenses being defrayed by the sale of refreshments, and by letting the smaller rooms, as well as the lecture hall, to various provident, temperance, and other societies, of which the members have formed several, all very flourishing, since the hall was originally opened. These societies form a bond of union amongst the frequenters of the club, besides doing great good in various ways. A religious service is held there one evening in the week, as well as on Sundays. Since the new plan has been adopted the place has been self-supporting, which it used not to be under the old system.

In January, 1865, forms to be filled up with various interesting particulars were sent to all the clubs whose existence was then known at the central office, amounting to about 180, and returns were received from 77, the number of ordinary members in which amounted to 18,327: 37 of these clubs, at the time of making their returns, were self-supporting; 32 are returned as having lectures; 29 as having classes; 23 as having provident societies of some description connected with them; only one mentions a Bible-class; 17 state that friendly or trade societies rent a room at the club for their ordinary meetings.

The number of clubs now on our register (January, 1866) is 302. The number of those that have failed, as far as I am aware, during the last three years is 19, which, added to those now in existence, give 321 formed since 1858, only two of that number having been formed previous to 1860; this gives only about 6 per cent. of failures, although a considerable number, unquestionably, are not at present in a very flourishing condition. It may, however, be fairly calculated—both from the above returns, and from those that are now coming in, in reply to questions sent out at the beginning of this year, as well as from other sources of information—that an average of 250 members to each club would be about the mark, giving a total of 75,000, every one of whom, probably, is making at least three people, young or old, more or less the better and happier for his belonging to the club instead of the public-house, giving a total of about 225,000 benefited by this important movement.

Now with regard to the causes of success or failure, I had better, perhaps, first recur to some of the general principles and plans on which Clubs should be founded and worked.

What, then, do men naturally desire in any place or society to which they turn for rest and companionship after their day's work? Clearly, *to know that they are welcome.* This they feel sure of at a public-house. If they do not feel it at a club they probably will not go there very often. I believe this to have been one of the greatest difficulties most clubs have had to contend with. For who is the proper person to give that welcome? Unquestionably the steward or housekeeper in the first instance. And wherever this functionary is of a cheerful, genial disposition, the effect in promoting the prosperity of the club has been very marked. But owing to the unavoidable exigencies of the case, the first duty of the steward, upon a person's entering the club, may be to ask him to show his ticket of membership, which makes the greater tact and cordiality on his part needful to give the new-comer, nevertheless, a conviction that he is heartily welcome.

Then, again, if the steward has to be where he can see the members' tickets as they pass in—*i.e.*, near the door—the newly-made member gets little further encouragement from him to feel at home in the club. But under any circumstances, it is of great importance that one or more members of the committee should take it in turns to attend every evening at the club, to welcome those members who have so recently joined that they have not had time to make acquaintances there, or who have no companions to introduce them, and give them a feeling of sociability and "good fellowship" in it.

And, lastly, every member of the club who has been connected with it long enough to feel at home in it, should exert himself to make everybody else feel the same, by manifesting a kindly, sociable disposition, especially towards those who have more recently joined. A friendly greeting when a man enters, and a pleasant smile or shake of the hand, making room for him at the fireside, handing him a newspaper, or inviting him to play a game of draughts, like many other seeming trifles, have a great influence for good—promoting not merely the success of the club, but something more important still, a true brotherly spirit among human souls.

What is the next thing men want after their day's work? Amusement, excitement of some kind or other, a complete change from the monotonous toil in which they have been engaged. This also they get, in one way or another, at a public-house, and it is indispensably necessary they should find it at the club. It is said in the letter to Lord Lyttelton* that this is the department in which the help of gentlemen may be so useful. The members of the committee must, indeed, devote themselves specially to this work of making the club attractive, but it is much larger than they can generally cope with, unless they get other persons to help them. In the Club, it is to be hoped the members will always exclude beer-drinking from the list of their amusements and excitements, but its place must be supplied by something else than merely tea and coffee or ginger-beer. Music and singing, recitations, a discussion class, concert, or other entertainment, are just what is wanted in addition to the ordinary games. But these cannot be provided every night in the week, nor would it be a healthy state of things for any club, night after night, to be dependent on them. Promoters and managers of clubs have, perhaps, too much forgotten that the main stay of a club—its backbone—should be pleasant sociable companionship. The best room in the house should be devoted to talking (and smoking, if it be desired), not called, as I have too often seen it, "*the reading room.*" Five men want to chat, for one that wants to read. But, in order to make men feel as much refreshed and amused there as they do in the tap-room, some members or friends of the club should take care to introduce a little entertaining conversation whenever there is an opportunity, and not trust to its coming, at first, spontaneously, as it does under the influence of beer and "*good*" fellowship at "the public." In clubs that have been fortunate in getting a large number of pleasant, sociable fellows together, who all know one another, or soon become acquainted, little more, in general, will be requisite; but where that is not the case, and occasionally even where it is, a gentleman who, in a thoroughly unpresuming manner, with a kindly heart, drops in as a *guest*, not as an overlooker, can often set the talk a-going in a very pleasant and natural way. Perhaps he takes up a newspaper, and having read a paragraph, mentions some anecdote, or personal adventure of his own, bearing upon it, inviting his neighbour to do the same. Or he brings a map, engraving, or diagram, to illustrate events referred to in the newspapers. Another week he may bring a microscope, or stereoscopes, and in one corner of the room, so that nobody is obliged to come and look unless they like, he entertains and converses with those who have not found amusement elsewhere. One evening, somebody else brings the skeleton of a bird, or of the human hand, and engages those who care to join in an interesting palaver on the structure and uses thereof. Another night, a bullock's eye may be dissected, and a highly amusing evening will be the result, decidedly more popular and attractive, as well as more promotive of the main object of the club—viz., "good fellowship"—than any amount of mere lecturing. Then, some other friend looks in now and then, and plays a game of draughts, or teaches a few members the mysteries of chess. While on some similar occasion, a few extracts from the "Summer Vacation" rambles of our enterprising young barristers and doctors will serve to make all who have joined in listening or asking questions, feel that they have spent a far jollier evening than if they had been fuddling and singing at the "Magpie and Stump," over the way.

Our limits forbid further illustrations, at present, of the various ways in which the committee and any educated men may help to make Working Men's Clubs attractive. The above, however, is quite sufficient to suggest a good deal more. But I beg to state, most explicitly, that all this help is recommended and supposed to be offered *only as supplementary* to what the members may do in that way themselves—never being intruded, but always given in a thoroughly genial, unassuming fashion; especially, also, with a view to stimulate the members to do the same sort of thing themselves, each according to his ability. Where aid is given in this way towards making a club-room attractive and sociable, I know, by long experience, that, from the Land's End to John o'Groat's, it will be right heartily welcomed by working men of every trade, section, and age, and with an amount of gratitude and respect proportioned to the frank and brotherly spirit in which it is offered.

* Referred to in last number.

Our Steam Marine.—There are now twenty-three steam packet companies in this country, who own about 370 steamers, the tonnage of which is 560,000, the horse power 110,000, and the value between £30,000,000 and £40,000,000 sterling. 164 of these ships are connected with Liverpool, 94 with Southampton, 40 with Hull, 35 with London, 16 with Glasgow, and 15 with Hartlepool; 200 of these steamers trade with the eastern, and 170 with the western hemisphere. Upwards of 80 of the largest of the latter trade exclusively with the United States. The whole of these steamers run about 10,000,000 miles, and consume 2,000,000 tons of coals in the course of a year, and they give employment to 30,000 seafaring men. The same number of sailing ships would not run one quarter the number of miles in a year. The above ships are exclusive of about 100 steamers that run to and from England and the Continent by the southern ports in the English Channel. The whole of this vast steamship power of the country has been created within the last thirty years.

Visits to the Sick.

I.—THE LONDON FEVER HOSPITAL.

It is urged against the special fever hospitals and fever wards that the concentration of poison increases the mortality amongst the patients, and considerably augments the danger to the attendants. The officials belonging to the Institution in the Liverpool Road, Islington, deny both statements, and, by comparative statistics, seek to prove that the best way to deal with this malady is in an hospital specially devoted to the purpose, and that it is far more dangerous to treat such patients in the wards of a general hospital. They say that during the first six months of 1862 1,107 cases of true typhus were under treatment at the Fever Hospital, of whom 232 died, or 20·95 per cent. In the same period 343 cases were attended to in six of the general hospitals of the metropolis, of whom 80 died, or 23·32 per cent. In the Liverpool Road Asylum the disease communicated itself to 27 persons, of whom 8 died; or for every 40 patients admitted one person took it, and for every 135 who came in one died; whereas, of 272 cases taken in by the "generals," 71 persons caught the disorder, and 21 died. It is, at all events, quite clear that a very hazardous duty has to be performed by those who risk waiting upon the fever-stricken; and whether the hospital at Islington be founded on right principles or not, it is particularly deserving of consideration at the present time, when this disease has such a fatal hold upon our population, caused, as it undoubtedly is, in the vast majority of instances, by the vile dwellings in which so many of our industrial population have to reside.

In this atmosphere of disease and death it is not very likely that the secretary is often asked for permission to view the wards. To a person who has been in the habit of inspecting other charitable institutions having a kindred object, the most striking peculiarity about this one is the utter desolation of the scene. About most others friends gather, and are at all times most anxious for the privilege of seeing their relatives or friends; but in such a tainted atmosphere as this it would be manifestly unwise—nay, criminal—to permit many visitors to enter. It is not well to venture upon too close an intimacy with the grim tyrant "Typhus," or his equally despotic ally, "Scarlet." Most persons feel a shock when they enter the long wards of the ordinary hospitals, but it requires a very steady nerve indeed to face the silent enemy who lurks around the beds of a fever ward. All honour to those who undertake the painful duty of ministering and waiting upon the patients!

The secretary, anxious that you should not face unknown danger, says, "You are not afraid?" Perhaps the confident "Oh! no," might subsequently be translated "Oh! yes." When the doctor opens the door of the typhus ward there is a very strong inclination to remain in the corridors and see through the glass what is the spectacle presented within. At the very moment we enter, the nurse comes forward from a centre bed, and quietly tells the doctor something. They both approach the patient, and in a short time you know that Typhus is holding a formal interview with King Death.

The general appearance of the ward was very similar to that of most large institutions; but that which struck a very chill upon the soul was the perfect stillness which prevailed. It is seldom that in the day-time a visitor will find thirty or forty patients lying as in the solemn quietude of the grave—not a movement—not a sound. There were beds down the wall, around the walls, and in the centre of the chamber, each bed occupied; but yet each of those sufferers lay as completely still as if the spirit had already passed into the unseen. Had the ward been a vault, each bed a coffin, each man a corpse, a more absolute grave-like silence could not have prevailed. I do not imagine that the restlessness of fever always precurses this dreadful calm, but such was the character of the scene when I visited it. Perfectly ventilated as the ward was, it nevertheless seemed a positively delicious sensation when the last still form had been passed, the door fairly closed, and I stood in the corridor, feeling the garden breeze. It is of the very first importance that a perfect ventilation should be preserved, or the place would become a very charnel-house. It is just to the officials to say that the medical officer of the Privy Council speaks very highly of the arrangements in this respect. I ask how the nurses and doctors fare who constantly do duty in these pest wards? "Every nurse, and every medical man, has the fever," answers the doctor who accompanies me. We most of us know what brave things women will perform in the hours of sickness and death, but it requires a very resolute and calm spirit indeed which can deliberately face Typhus, with the certain knowledge that one day he will lay you on a bed of pain and suffering, or kill you. Family love and affection will override all fear; but to undergo the chances of infection for payment alone, to tend the very poorest fever patients for money, does seem somewhat strange; but thank God that there are women who will do so, and that with the greatest kindness. Let us hope that when Typhus or Scarlet seizes hold of these watchers, it is not many aches or pains he inflicts on the good souls; and that, when the poisoned arrow brings death, they may obtain the reward of the merciful and just.

In 1863 there were eighty-three attendants, including laundry-women, and of these twenty-three caught typhus—viz., one assistant resident medical man, one matron, one engineer, who had been attached to the hospital for sixteen years, and eighteen nurses; an assistant medical officer and one dispenser took scarlet fever. Of these there died the engineer and four nurses from typhus, and one assistant medical man from scarlet. Notwithstanding this apparently heavy loss, the report defends the establishment against those who have denounced it as a "crime against humanity, and a disgrace to the age in which we live," and says that the objections which are raised against a fever hospital, thoroughly ventilated, are not justified by facts, and that a given number of typhus patients can be treated on the plan of isolation with equal advantage to themselves, and with far less danger to the attendants and the other patients, than in the wards of a general hospital. Some time since patients were admitted into the wards indiscriminately; all sorts of fever were huddled together in the same wards; but a much more sensible plan is now adopted, for we are told that—

Owing to the frequency with which patients contracted other diseases than those for which they were admitted, the plan has been adopted of isolating in separate wards the typhus and scarlatina patients from the other patients, and from one another. The result has been most satisfactory; instances are now extremely rare of patients contracting either typhus or scarlet fever. It is a remarkable fact that out of 365 patients admitted during 1862, with other diseases than contagious fever, not one contracted fever while in the hospital. The few instances in which typhus or scarlet fever was contracted by the patients during 1864, were mainly due to the great pressure occasionally interfering with the classification of the patients.

The only noticeable difference between the typhus ward and the "acute," was that in the latter some of the patients, by sitting up in bed, showed they were living, though still the same profound stillness reigned. In 1864 there were 3,610 patients admitted, being 911 in excess of any previous year. At the present time the demands upon the institution are more urgent than ever—fifteen to twenty-five cases a day—and the committee are, therefore, compelled to build a new wing. That this additional accommodation may be provided as speedily as possible, the building will most likely be of iron. Of these 3,610 patients, 3,175 were suffering from fever in the strict sense of the word. This is the grand enemy with which the hospital has to grapple, and it is a melancholy reflection that it is a fever which, under a different system, could be fairly driven from our midst. It is propagated, and perhaps generated, by overcrowding, and is the fearful penalty we have to pay for continuing the "plague spots" in our midst. It is the disease upon the prevalence of which the variations in the number of admissions to the hospital mainly depends. As Mr. Rawlinson, C.B., said at a meeting recently held, "These fever-ridden places actually cost the country more money than all the Queen's palaces." The epidemic which is now raging is confined to the poorest class of the population. A very large proportion of the patients admitted during the year had been out of employment, and in a very destitute condition, for a long time prior to the attack. The localities of the metropolis whence those came who had been laid hold of by this tyrant Typhus, were the poorest and most densely crowded. It is amidst poverty, filth, and squalor that he holds his court with despotic sway.

Very strict precautions—and absolutely necessary ones—are adopted to prevent the disease being carried from the hospital to the surrounding neighbourhood. For this purpose, all the linen of the establishment is washed in the house, and undergoes a thorough disinfecting. Some articles, which cannot well be washed, are baked in ovens erected for that use. Belonging to the hospital is a carriage for the conveyance of the patients who are to be admitted, and which, upon request, is sent to any part of London. This is specially serviceable in preventing street cabs being used in removing persons suffering from such contagious disorders. That cabs should be ever used in this way is most disgraceful, and ought to subject the parties so acting to punishment. A given number of patients brought in were thus classed:—215 domestic servants, or policemen, for whom admission fees were paid; 71 admitted free, and 3,324 by parish orders—of whom but a small per-centage was paid for. Many of the paying cases were medical men or nurses, or persons who had contracted the disease in other hospitals. It is to be expected that the expenses of such an institution are very heavy, and although the demands are ever increasing, and promptly met, it does not receive a corresponding support. As patients require stimulants, the cost of meat, milk, eggs, wines, spirits, and beer, is a very large item in the accounts, cod-liver oil being another. Attached to the hospital is a good-sized piece of ground, which I could not help thinking might be much more advantageously and pleasantly used. It is now a mere garden for vegetables, and the convalescents, when they have the opportunity of walking in it, are confined to dirty paths, with nothing more interesting to behold than cabbage-stumps or potato beds. This is no very cheerful scene for such sick folk. If it be necessary, on economic grounds, that it should be continued, I hope that the committee may soon be relieved, and be able to convert it into a lawn with flower-beds. How much more delightful to the patients would it be to stroll over a grass plat, than have to content themselves by looking on such a waste! As a rule, our sick establishments might be made much more cheerful than they are. While patients receive the very best of medical skill and nursing, little effort is made to make the wards other than dull, dreary, whitewashed rooms, with corridors still duller and darker, holding out no invitation to the convalescent to leave his sick chamber, even for a few minutes. There are some hospitals, however, where things are different, and one of these we will visit next week. The institution is blocked in on three sides by rows of houses. The visitor is assured, however, that no evil happens to them on account of their contiguity to such a mass of poison. Still, it must be quite as much a matter of convenience as taste to live very close to a fever hospital. In conclusion, I am happy to say that the poor patients here receive the most unremitting kindness and attention.

WHAT IS WEALTH?

Wealth is something more than gold,
More than luxury and ease—
Treasures never to be told
May be found apart from these.
Men who great possessions own
May be needy, none the less—
They are rich, and they alone,
Who have store of nobleness.

Palaces are dreary domes—
Fair demesnes, but deserts wild—
If there be not happy homes,
Gentle thoughts and manners mild.
Trust me, though his lot be small,
And he make but slight pretence,
He who lives at peace with all
Dwells in true magnificence.

If you'd prove of noble birth,
Oh, beware of judgments rash!
Scorn to measure human worth
By the sordid rule of cash.
Gold and silver may depart,
Proudest dynasties may fall;
He who has the truest heart,
Is the richest of us all.

Mr. Bright's Chicago Letter.

THE greatest living expounder of the operations of Free Trade, and the chief surviving leader of that memorable movement, which established in England the political ascendancy of the principle—Mr. Bright, M.P.—has lately addressed a letter to a Chicago correspondent, which has received well merited publicity in this country. All that Mr. Bright speaks or writes, is expressed in massive, clear Saxon, which is matter both of admiration and study; and upon any subject with which he chooses to deal, he throws a light, so fresh and strong, that obscure points become vivid. This is true of his short but impressive Chicago letter, which is worth the attention of working men.

America cannot see its way to Free Trade: as for that, the working classes of England did not much appreciate it twenty years ago, and were either quiescent about it, or unfriendly to it. They thought more trade meant merely more work—and had not the ingenuity to understand how they could extract higher wages out of abundant work. Yet this has come about. In many counties of England, as Mr. Bright observes, wages have risen from 25 to 50 per cent., even among farm labourers, who, of all the working class, are the least capable of controlling their own condition.

Without Free Trade, even trades unions must have had but limited success. No great increase of wages can be obtained, until there exists considerable commercial wealth, which can only be created by great trade. Indeed, it is only after a period of comparatively good wages, that unionists themselves can accumulate the subsistence funds necessary for a strike. Free Trade is the lever by which they have risen in means at home. As Mr. Bright puts it—"The workman's safety and success depends upon the state of trade, and the greatness of the demand for labour." It is "perfect freedom of trade which creates the greatest demand for labour, and gives the highest value to the workman's skill and industry." No scheme of protection, no imposition of tariffs, no restrictions of whatever description, do more than benefit the few at the expense of the many. A few wealthy employers, or exclusive corporations, may make large profits by the monopoly they are enabled to wield; but trade is limited, the limit itself decreases trade by driving purchasers away, and the workman, whose skill is excluded, and for whose labour there is no demand, finally and chiefly suffers. Free Trade opens the world to the workman. All known lands become his field of enterprise, and every port the market of his produce.

Even Americans coming to England and returning to their own country, furnish themselves with clothing enough to last themselves for years. Thus protection of the manufacture of cloth in America, as Mr. Bright shows, limits the trade and sends the native American customer to England to buy that which could be, and ought to be, purchasable at his own door. American workmen, sharp as they are in most things, do not see this. They are generally in favour of protection for trade. No man will look all round a machine more sharply than an American; but he cannot look all round the market. This implies the habit of wide views. It takes a higher order of mind, it requires an enlarged thoughtfulness, to calculate the effect of a principle on general interests. The time will come when the policy of trades unions will be reconsidered in this light. It is perhaps yet too early to expect it. Freedom of trade implies freedom of labour—a subject as yet in its infancy. Precisely the same class of arguments which are used now in America, to restrict trade and protect it, are yet popular in England for the protection of labour. The same benefits will accrue to all classes of workmen—higher wages will be commanded, and thousands of workmen will rise to distinction who are now kept down by self-imposed restrictions, when there shall arise advocates of the freedom of labour, as able, as far-seeing, and as influential among workmen, as those who won freedom of trade among manufacturers.

Mr. Bright's great aphorism, which splendid experience has confirmed in England, is that "Free Trade always means great trade, and great trade always means a great demand for labour, and this always means and necessitates a high rate of wages." No intelligent workman who reflects upon this, and is aware of the proofs upon which this vast and important assertion rests, can be other than a partisan, by rational and unchangeable conviction, of the great principle of Free Trade.

The Birmingham Exhibition.

SINCE the publication of Mr. Everard's letter in No. 4 of the WORKING MAN, we have received several letters relative to the management of the Birmingham Exhibition. From these it is evident that considerable dissatisfaction exists among exhibitors, produced, it is asserted, by the treatment they have received at the hands of the committee. In the first place, the statement of Mr. Gillman, that exhibitors were led to believe that £1,000 would be expended in prizes, which was denied by Mr. Everard, has been confirmed by the production of a lithograph circular, signed by the Rev. Dr. Miller. This circular, soliciting contributions to the guarantee fund, contains the following passage:—"Our immediate object in this application is to solicit your name for our guarantee fund, which, for the necessary expenses and for prizes, must not be less than £3,000. The guarantee notes hitherto issued have been worded for prizes, and about £1,000 have been guaranteed *for that object.* All future guarantee notes will be for working expenses." The statement that £1,000 was guaranteed for prizes, is also confirmed by Mr. S. Wall Richards, member of the Guarantee Committee.

As to the surplus, no information can be gleaned from the imperfect statement issued by the committee, and which we have already published, inasmuch as it reported that £4,094 5s. was taken, while but a few items of expenditure have been given, amounting only to about £600. The committee will, no doubt, see the necessity of issuing an abstract of their accounts as early as possible, or, at all events, of satisfying the natural curiosity of the exhibitors as to the amount of the surplus. The sum actually expended for prizes, although said by Mr. Everard to be more (in *intrinsic* value) than given by "any working man's exhibition in England," is not stated. If, as has been asserted, £110 only was devoted to the purpose of rewarding the exhibitors, in the shape of prizes, while £291 10s. was voted to members of the committee, the dissatisfaction which evidently exists can scarcely be wondered at. The remark made by Mr. Everard, that the complaint as to articles having been stolen from the exhibition was "a libel upon the inhabitants of Birmingham," receives a striking comment, the names and addresses having been sent us of several exhibitors who complain of having suffered loss by their goods being stolen or destroyed, and who could obtain no satisfaction from the executive. There are several other apparently good grounds of complaint on the part of the exhibitors, who refer to the published reports of the committee's proceedings as evidence of general mismanagement.

On the other hand, however, the executive have, no doubt, had many difficulties to contend with, and they have done much which entitles them to the thanks of the working men of Birmingham. In undertakings of this character, where experience is wanting, and where men unite together for a common object, considerable forbearance should be exercised by all parties concerned; and in this case we shall be glad to hear that the committee are willing to meet the wishes of exhibitors, as far as may be consistent with their duty to the public.

What Governs the Rate of Wages?

BY ARTHUR HOUSTON, M.A.,

Whately Professor of Political Economy in the University of Dublin.

THERE is no question presented by the condition of the working classes a satisfactory solution of which is more urgently required, than the wages question; and there is none, perhaps, about which a greater conflict of opinion exists. On the very threshold of the subject a most formidable difficulty awaits us. One section of those who speculate upon it maintain that the rate of wages is determined by causes over which neither the labourers themselves as a class, nor society at large, can exercise the smallest control; while a directly opposite view is taken by another section, who insist that the influences which govern the rate of wages can, to a very great extent, be modified in their action by legislation, by public opinion, by usage, and by combination, on the part either of employers or employed. It is quite evident that in the wages problem this is a fundamental question. Till it has been disposed of, we cannot with safety advance a step. If it be true that the labourer's remuneration is fixed by a rule which admits of no deviation, and resulting from causes altogether beyond the reach of human control, then the whole matter is at an end, and the labouring classes, and those who are anxious for their welfare, had better desist at once from fruitless attempts to effect their purpose by acting on the rate of wages, and direct their efforts to some less barren field of exertion.

Now, in order to decide this preliminary point, let us endeavour to exhibit the argument of those who take this view in the light in which they present it themselves. For this purpose, it will be convenient to refer our readers to an article that appeared in our first number, at page 11, under the title of "A Saturday Sermon," and which was extracted from the *New York Journal of Civilisation.* The object of the writer, apparently, was to dissuade the working classes from making any attempt to induce the Legislature of the United States to limit the hours of labour by law. To this end, he endeavours to prove that the conditions under which labour is hired are determined by influences entirely beyond the reach of legislative control. As his argument may be taken as a fair specimen of that employed by the school to which he belongs, we shall take it as the basis of our present investigation.

It will be seen, by turning to the article referred to, that the line of argument pursued by the writer is as follows:—The laws of political economy, like those of physics, are absolutely inflexible. There is no evading or resisting them. The value of every commodity is determined by demand and supply. Labour is a commodity; its value, therefore—or, in other words, the rate of wages and the conditions generally of the con-

THE WORKS OF THE THAMES IRON SHIP-BUILDING COMPANY.—(*See page* 82.)

tract between the workman and his employer—must obey this law. To endeavour, therefore, by legislative or other interference, to alter the rate of wages, or the conditions under which the labourer works, would be as vain as—in the words of the preacher of the "Saturday Sermon"—"to legislate against the attraction of gravitation or of cohesion, or to attempt to redistribute the oxygen and nitrogen of the atmosphere."

Our readers will perceive that the foundation upon which the whole of the above argument rests, is the inflexibility of the laws of political economy. Now, we deny that these so-called "laws," or the so-called laws of the physical sciences, or of any class of sciences whatever, *are* inflexible in the sense which the argument implies. The word "inflexible," throughout that argument, is used in the sense of "irresistible." It is represented that all opposition to the laws of political economy must inevitably fail. In fact, if any other meaning were attached to the word, the argument would fall to the ground. Now, we repeat, the so-called "laws" of political economy, and of all other sciences, are of a wholly different character from that here attributed to them. Instead of being inviolable, they are constantly broken. Take, for example, the law of gravitation, so often employed as an illustration of the inflexibility of economic laws. Is it irresistible? To be sure, it would be as silly to seek to overcome it by *legislation*, as it would have been for King Canute, had he been in earnest, to order the advancing tide to refrain from wetting his royal feet. But had his Danish majesty act his idle courtiers to throw up an embankment round his chair, he might have sat where he was, high and dry, despite of all the water in the German Ocean. You cannot, by kingly edict or Act of Parliament, prevent the tide washing over your feet or your fields, if they are on the sea-shore, and below high-water mark; but if you want to keep them dry, you have only to build a stout rampart, and the thing is done. So it is with any of these "inflexible" laws of nature—gravitation, cohesion, and the rest. Within certain limits they may, most of them, be successfully resisted, if only the proper means be taken for the purpose; in fact, every step in the progress of civilisation is little more than an additional triumph over these very laws, by which they are shorn of some of their power for evil, without being robbed of any of their power for good. To return to the law of gravitation. In obedience to it, objects have a tendency to fall to the ground; but do they, as a matter of fact, inevitably do so? Certainly not. This law is daily, hourly, momentarily transgressed by everything that has life, and by many things that have not. You cannot go up-stairs without breaking it; the minutest insect that flies sets it at defiance; the balloon in the air and the cork in the water actually *ascend* by virtue of the law itself. There is an end, therefore, of the alleged inflexibility—meaning thereby irresistibility—of this law; and there is scarcely a law of physical science of which precisely the same may not be said. In fact, "law" is about the most inappropriate and misleading term that could be applied to the thing which in such cases it is intended to designate. These things—gravitation, cohesion, and the rest—are not *laws*, but *forces*; forces which can be modified, controlled, or overcome, if only the proper means be taken to do so. If we correctly measure their strength, and oppose to them forces of equal or greater power, we can curb and subdue them. So it is, also, with the laws of political economy, and of the sciences which belong to the same class. Such laws are no more irresistible than those of mechanics, for example. They represent, like the latter, forces of a greater or less degree of strength, which will yield to a greater or less degree of resistance. Is practical proof of this assertion required? It is not far to seek. What are the laws regulating the conditions under which it is permitted to employ children, but instances of the effectiveness of legislation in modifying the natural results of economic laws? To take a more familiar illustration still: if the laws of political economy are of that rigidly inflexible character attributed to them, how comes it that one day in seven is strictly observed as a holiday in some countries, and not in others? Surely, if the influence of religion is enough to put a check on that general desire for gain which forms one of the most fundamental laws of the science, other influences may be able to do so in an equal or less degree. The truth is, those who, in the language of the preacher of the "Saturday Sermon," assert that "the laws of political economy are not less absolute than other laws"—such as those of physics—are guilty of a double mistake. For, not only is it not true, as we have seen, that the laws of physics are "absolute"—*i.e.*, independent of human control—but it is not true that the laws of political economy are in this sense as absolute as those of physics. The fact is, that many of the laws of political economy, so far from being independent of human control, are altogether of man's creating. The laws of physics are the offspring of Nature; but the laws of that branch of political economy which deals with the distribution of wealth, within which questions of wages fall, are, some in the whole, and some in part, the children of society. Thus, for example, the contract between landlord and tenant, which in these countries is regulated mainly by the spontaneous action of demand and supply, is regulated in Prussia by positive law, and elsewhere on the Continent by long-established custom.

The argument, therefore, against legislative or other interference with the rate of wages, founded on the alleged inflexibility—that is to say, irresistibility—of economic laws, entirely falls to the ground. These laws do not present an impassable barrier to such interference, but only a resisting surface, so to speak, which, within certain limits, will yield to pressure properly applied.

This impediment having been thus removed from our path, we are now in a much better position for attacking the wages problem. We now see that the laws of political economy are to be regarded merely as obstacles of a not insurmountable kind, which are to be accurately measured and allowed for, and that the probable efficacy of any proposed means of acting on wages, is to be estimated with due reference to them. Political economy does not take the wages question out of the hands of the labourers or their representatives; it merely draws attention to certain difficulties, which must be recognised and overcome before the question can receive a satisfactory solution in practice.

In a future paper we shall consider how far it is possible, and how far it is expedient, to exert the power of regulating wages which society has been thus shown to possess.

Inexhaustible Ivory.—New Siberia and the Isle of Lackon are, for the most part, only an agglomeration of sand, ice, and elephants' teeth. At every tempest the sea casts ashore fresh heaps of mammoths' tusks, and the inhabitants are able to drive a profitable trade in the fossil ivory thrown up by the waves. During summer, innumerable fishermens' barks direct their course to this isle of bones; and in winter immense caravans take the same route, all the convoys being drawn by dogs.

Art and Handicraft.

VI.—THE LOGIC OF INDUSTRIAL ART (*concluded*).*

FOLLOWING up the course of argument commenced in the last article, it is now necessary to the thorough apprehension of the question under consideration to enunciate, in as unmistakable a form as possible, the principles which it is desired should guide alike—the designer, the workman, and manufacturer, the buyer for the market, and, finally, the consumer, in producing and judging of works of industrial art.

As already stated, there are three points which demand consideration in designing, executing, and finally deciding upon the merits of such works:—

1. The use or purpose for which the object is made.
2. The material or materials of which it is made.
3. The means by which it is made.

As a matter of course, the last point affects the consumer much less than the other two, but it is of essential importance to the designer and the workman.

Taking the first point. The *utility* of an article of domestic use may appear to be totally independent of its ornamentation or decorative adjuncts; but it certainly is not of its form. When sound judgment is used in the selection of the form, the purpose for which the object is required will have primary consideration, and the exercise of this judgment constitutes that indefinite thing or sentiment usually called taste. The form, then, becomes an essential element in the beauty of the object, since it is subservient to the purpose for which the article or object is made, whilst the line of the form is as graceful, and as true in the relative proportion of the parts, as the end to be attained will permit. Take a drinking-cup, for example. Such a vessel could be made with simple reference only to its capacity to hold liquid and allow its contents to be drunk. Little or no attention need be paid to its external appearance, or even form, except that portion which would have to be carried to the lips, which would certainly require to be so shaped that the liquid could flow from the interior of the vessel into the mouth. It may so happen, however, and has indeed happened in many an instance, that so much attention was paid to the decorative character of the form, and that, too, in a mistaken imitation of some selected natural type, that this essential portion of a drinking-cup was so distorted, in order to render the vessel ornate in its structural lines, that the liquid contents could not be conveniently drunk, or that the form suggested the possibility of shedding as much liquid as would be imbibed in the operation of drinking.

As a matter of course, in such a case, the utility of the cup as a drinking vessel has been sacrificed to its appearance as an ornament; and however pretty its appearance may be, it is badly designed; and all the art-skill which may have been exercised upon it has been practically thrown away. Thus the conclusion arrived at on this point seems to be inevitable, and may be stated as a distinct proposition always to be kept in view in designing or executing any ornamental article of utility; and which, perhaps, it may not be presumptuous to call

Canon I.—The use or purpose for which an object is intended should be met in its form and structure, and no decorative adjuncts or ornaments be permitted to interfere with its utility, or be contradictory to the position such adjuncts or ornaments occupy, in relation to the whole.

The study of the material, and a proper consideration of its adaptability to the forms essential to the use of the object to be constructed of it, is the second point.

There are few more prevalent errors in the production of ornamental works in the present day, than those which arise out of the assumption that, because certain forms and decorations are well adapted to, and are appropriate in one material, they will be equally appropriate to, and look equally well in another material, probably of a totally different character. There can be no doubt that one of the great essentials of good designs in industrial art, is the adaptation of the *motif* or theme to the special natural characteristics of the material or materials, if varied, in which the design is to be realised. One of the great secrets of success of the artists, designers, and workmen of the Middle Ages was the intelligent, simple, common-sense adaptation of the forms they produced to the nature of the material in which they wrought, after a careful consideration of the perfect suitability of that material to the purpose they had in view. The great variety and excellence of the designs produced by them while simply ringing the changes on the same types, have been the constant theme of admiration, and a source of infinite pleasure to the antiquary, as of late years they have been a source of constant and varied instruction to the art-student. The rule holds good in its application to any other style of art, as well as to what is popularly termed "Gothic"—though not, perhaps, always to the same extent; nor is it always so easy of full application.

Surely it ought not to require any elaborate argument to show that forms well adapted for execution in wood, where the fibrous character of the material affords facilities for delicate and extensive undercutting and very high relief, are not equally fitted for stone or marble, where the material is granular and friable. Nor is it very wonderful if forms executed in wood, stone, or marble, with marked success in their adaptation to each, are not equally well adapted to metal, be it brass, bronze, or iron. Again, forms which are suited to look well in brass and bronze, are the very reverse in iron; whilst even in this latter metal itself, the difference between the facilities for producing certain forms of easy adaptation to wrought-iron, as compared with imitations of the same forms or details in cast-iron, must be evident to every one, apart from the fact that the economy, when it does exist, is only at the expense of usefulness and endurance; since cast-iron is no substitute in the matter of wear, tear, and resistance, where ornamental forms are really adapted for production in wrought-iron.

It would be impossible to select a better example of the importance of studying the peculiarities of material in its adaptation to special design, than the great stride which has been made during the past twelve or fifteen years in the ornamentation of glass, and the adaptation of ornamental forms to the peculiar nature of this substance. The crystalline, translucent, and brittle character of glass seems to indicate at once the true nature of its structural use, as in the case of fountains, candelabra, and blindred objects; but a frightful amount of bad design has been got into this material through an obstinate determination to ignore its very constitution, and make it do duty in forms only adapted to materials of a totally different character. All ornamentation in or on forms of glass, should arise out of skilful advantage being taken of the qualities above named for the production of variety in colour and decorative detail—primarily, in using the effects of light in transition through the material to obtain prismatic results by cutting in facets, and secondarily, in the partial stoppage of light in transition for the production of ornamental effects in dead glass by engraving; and this altogether apart from the question of coloured glass in any form—simple or in construction.

It is astonishing to what an extent the violations and contradictions of the true character of the material is still carried in important structural objects in glass. Instead of honest and common-sense cuttings in facets, which afford an infinite variation of geometric arrangement, acanthus leaves, Greek scrolls, and Roman pateræ, are "pressed" in the material, and used as decorative adjuncts. It never appears to enter the minds of the people who design these things that the very quality which gives value to these forms in stone and marble—opacity, by which the forms fulfil their true use, and look as the old artists intended them to look under the influence of direct light, producing, of course, direct shadow—is utterly lost as the light passes through them, and is refracted as well as reflected, until the very form itself is comparatively lost.

This is given as an extreme illustration; but it is, nevertheless, so true, that the conclusion is forced upon us in the form of

Canon II.—The material of which any object is made, should, in combination with the purpose for which the object is made, be considered in all its bearings, and the forms and ornamental details adapted to the most economical and enduring use of that material, in relation to its external appearance and internal structure.

The third point which ought to be considered, alike in designing as in judging of any ornamental work when executed, is the mode of manufacture—whether by hand-labour, or by special mechanical means.

This opens a very wide field for consideration, especially when we take into account the great industries comprised in the various classes of textile fabrics; for in nothing has ornamental design in England failed so signally, as in the intelligent consideration of the special conditions under which ornamental forms and decorations can be produced in various materials by mechanical means. Instead of modern progress in mechanical science having been made the means, as it might have been, for the promotion of progress and the development of originality of conception in ornamental design, it has, in nine cases out of ten, tended rather to obstruction. So much has this been the case, that many earnest and thoughtful advocates of a more catholic diffusion of art, have assumed that the introduction of novel and economical mechanical methods of production, has been inimical to true art-progress, and as such to be decried and avoided, rather than studied and used; the fact being overlooked that the hammer, chisel, chasing-tool, or graver, are all so many mechanical means, as aids, to an end—that end being intelligently kept in view by the artist workman who uses them.

If art works were to be confined, as in a bygone age, to the exclusive few, this question would be scarcely worth raising; but as in these modern times art is rapidly taking its position as a necessity in our intercourse with other peoples, and, to meet the exigencies of a foreign as well as a home demand, the instrumentality of mechanical means is required in order that the refining influences of art may be brought to bear in a more rapid, economical, and successful manner—hence we are bound to consider the best use and most extended application of these means to a given end. It is true that modern mechanical means and scientific appliances have been chiefly made use of for the purpose of producing cheap imitations of objects of art, in a far-off rivalry of productions which were the result of a totally different method. This, however, is no reason why our designers and skilled artisans should not study these new means for the purpose of producing new results, or that our manufacturers should be content to follow slavishly in the conventional grooves of bygone types. It is maintained, then, that the new means furnished by modern science and the extraordinary development of mechanical skill, which is one of the great characteristics of this age, should be, and might be, brought to bear upon the legitimate and common-sense end of producing novelty and originality, in combination with utility and beauty. Wherever this has been done—and happily it has been achieved in many instances, when designers and manufacturers have had the courage and intelligence to study the scientific and mechanical means around them thoroughly, and not allow themselves to be so hopelessly and almost helplessly wedded to a beaten track—the results which have followed have been at once legitimate and satisfactory. Thus, instead of throwing away the means at our disposal in attempts after the complicated in form and colour, these mechanical aids, when legitimately studied and used, should always tend to the production of the simple and pure. If this were done, an intelligence and precision unknown in past times, except in very rare instances, where great artistic skill has been brought to bear in the execution of some special work, would be the result in the great majority of instances in which ornamental details and objects are wrought out by purely mechanical means.

This leads to the statement of

Canon III.—The scientific and mechanical conditions under which any object of ornamental art can be produced should be carefully studied and considered in relation to the results obtained, or obtainable, alike in an artistic and economic point of view.

The task undertaken at the outset of these essays on "Art and Handicraft" is accomplished so far as this introductory series is concerned. The question of practical illustrations of the principles laid down, it is hoped, with sufficient

* The leading portions of this article were written, and printed for circulation among the personal friends of the writer, some two or three years ago.

clearness to enable any intelligent person to apply them for himself, must be taken up at some future and more convenient period. In the meantime it is hoped that all really interested in the matter will see that one great truth underlies this question of ornamental art, as applied to the utilities of life. It is this: That "He who has done all things well" has adapted "all things" to a use, and that, to the thoughtful mind, the beautiful and the useful are the most characteristic qualities of all things in nature, and that man, in seeking to render the useful decorative and ornamental, is simply following the example of his Divine Creator. George Wallis.

Where Some of Us Buy the Sunday's Dinner.

The most thriving among us, especially those who enjoy the great benefit of receiving their wages on Friday instead of Saturday, buy their legs of mutton, their vegetables, the apples for the pudding, and the titbit of cheese which comes after, in a quiet and regular way at the ordinary shops. It would not be worth while to attempt to describe such a regular proceeding as marketing in that manner. The wife has got it all over by the time the husband gets home on Saturday evening; the house is clean and tidy; and she is sitting down, making herself comfortable over a job of sock-mending for the little ones, or otherwise preparing for a neat, quiet, orderly Sunday. But many men do not get their wages till Saturday night; and many more, when they do get them, find them so small—especially after the week's "tick" of the shop has been settled—that they and their wives are obliged to look out for a market where things are at any rate cheap, if they do not deserve the remainder of the proverbial phrase, "and nasty."

There are many "poor men's markets," which are familiar enough to the working Londoner, but of which the classes above them have very little knowledge. Even the "amateur casual" might find something to note which would be almost as strange to refined gentility as his picture of the Lambeth ward. I should like to take some well-to-do people that I know of to the markets where some of my mates buy their Sunday dinners, the woollen jackets and boots for the little ones, and the bits of clean cap-border which the wives put on out of respect for the Sabbath. I would advise them to keep their eyes open, though if they could sometimes shut their ears they would be all the better for it.

Which shall we visit first—the New Cut, Somers Town, Clare Market, Leather Lane, or Whitecross Street? They are types of others of the kind to be found at Westminster, Whitechapel, Shoreditch, and other places. Some of the Saturday night markets are held in main thoroughfares, but, as a rule, the choicest specimens are in comparatively bye streets, such as Chapel Street, Somers Town; Leather Lane, or Whitecross Street. The last-named will probably suffice to convey to my highly respectable friends a general notion of the aspect of a "poor man's market."

Six hundred years ago a great white cross stood at the end of the lane which led into the road known as Barbican, so named from the fortified outpost of the City walls, which commanded the access across the fields to the old embattled city. The cross and all its associations disappeared centuries since, with the daisies in the fields. In our time Whitecross Street is a main artery of one of the poorest and most squalid districts of London. Miserable, hopeless poverty seems inseparable from the associations of the place. The huge, blank walls of the debtors' prison frown upon it—the prison where the ruined, despairing gamester, the wretched insolvent, the truculent swindler, sighed or recklessly laughed out the remainder of their miserable lives. At the small shops, or the squalid stalls in the streets, the tattered prison-runners, the hapless wives and children of the debtors, bargained for the cheap morsels which sustained the physical existence of those within the walls. There are few prisoners now-a-days; but walk down Whitecross Street on a Saturday night, and you will see pinched faces, anxious eyes, thinly-clad forms, the signs and seals of extreme poverty, which may tell you that there are bonds and gaolers outside prison walls, just as the boisterous laughter, the coarse jollity, the unabashed ruffianism of others, too surely show how little shame exists where shame is most needed. But there are other and pleasanter sights to be seen. Cheerful couples are bargaining for fat shoulders of mutton, cheapening "block ornaments"—as the odds and ends which lie on the block in front of the butchers' shops are called—speculating on the probabilities of the pair of side-spring boots which have been so neatly mended fitting little Johnny, who evidently wants them badly enough; and altogether laying out their money to good advantage, not without an eye to a market penny, which will be invested in a horse and cart or a monkey on a stick for the baby.

A strange sight it is, as we look down that long vista lined with glaring shops, and the inner line of stalls and costermongers' trucks and barrows, each with its own flaring, smoky lamp, giving out a flickering tongue of flame, and an almost insufferable odour of naphtha. At the butchers' and potato-dealers', jets of gas half a yard long threaten the heads of the passers-by; and at some of the shops, where the front stall is the property of the shop-keeper (who does not feel inclined to allow the irregular dealers who do not pay rent and taxes to have things all their own way), a temporary gas-pipe spans the footpath, and bends down over the stalls. Odours of fish, closely-packed vegetables, gas, naphtha, butchers' offal, and the grains from the neighbouring brewery, pervade the atmosphere, and though evidently agreeable enough to the frequenters of the market, are somewhat oppressive to the chance visitor.

It is hard work making one's way through the narrow, crowded street, made narrower still by the numerous stalls. One of the first ideas which strikes a stranger, is that the London poor must be desperately fond of vegetables. The barrows are heaped with bunches of greens and Savoy cabbages; enormous carrots and huge onions crowd the stalls. "Here yer are, ladies, look at the best bunch of greens in the market!" "Now then, ingens!" and such like cries, resound on every side. It seems impossible that the inhabitants of any half dozen parishes in London could consume three-quarters of a mile of green-stuff. But it will all be sold in a few hours, and we need not think that all the good folks about us are vegetarians, for there are butchers' shops by the dozen; shops laden with bacon, pickled pork, cow-heel, tripe, faggots, and ready roasted pork, half-cold shoulder of mutton soddened in fat, rolly puddings, pigs' trotters, sausages, and saveloys. Whelks are abundant and awful, gigantic and slimy, drawn from their twisted shells by the pneumatic power of human suction, and swallowed with gusto. Stewed eels are popular at shops and stalls, and children get spoonfuls from the cups of the delicious fluid, looking something like pea-green curds and whey, while their mothers are enjoying and chatting over a Saturday night's treat.

The butchers are in a state of chronic rivalry and warfare. They are hoarse with shouting invitations to their customers, and with abusing each other. The shops are lined with meat, rising in tiers to the first-floor window, and pieces of beef, flabby in texture and scanty of fat, swing from projecting hooks in front, being kept in a state of gyration, as if roasting, by well-directed slaps of the butchers' hands. "Fine meat! fine meat at seven-and-a-half! Use you well, ladies—use you well; don't buy the cag-mag over the way," shouts one vendor. Another falls back into the roadway, and, in a burst of admiration at his own display, roars out, "Beautiful meat! fine meat! [very inappropriate adjective] fine meat!" At Christmas time the joke is perpetrated of fixing a many-coloured rosette to a skinny bit of the ribs of a deceased cow, by way of reminding the purchasing public that it is the season for prize meat. The pork-butchers are as loud-voiced as their fellow-tradesmen or the stentorian costermonger with his cabbages. The lively individual seizes hold of a streaky bit of pickled pork, and holding it high above his head, shouts out, "Here's a colour for pork! Here's pork for six-and-a-half!"

At the fish stalls, huge cod, looking tolerably fresh, are cut up at twopence-halfpenny a pound, which sets us thinking on what has lately been written about the profits of fishmongers. Oysters, each as big as a cheese-plate, are in great demand. Potato-ovens, shaped in imitation of locomotive engines, are filled with big "murphies," which, when cut, are really the "balls of flour" the proprietor calls them. There are stalls for the sale of cobbled boots and shoes, and for new articles of the same species; for bonnet-shapes, tapes, braid, artificial flowers, cheap Brummagem jewellery, needles, knitted nightcaps, combs, toys, crockery, glass, tinware, second-hand clothes, and innumerable other matters. The grocers' shops are the "Original Teapots;" the milliners have for sale "five hundred cap fronts under cost price." At the edge of the pavement are little heaps of woollen jackets, socks, and frocks for children, all dirty and second-hand, but apparently much sought after. Narrow, dark alleys pour out a motley crowd into the main thoroughfare, and swell the varied throng; shoeless street boys "chivey" each other in and out among the stalls; faded women offer needlework dolls for sale; staggering men, muddled with drink (for the gin-palaces and beer-shops are crowded, and those who have spent their money are continually making way for new arrivals), jostle the young wife carrying home the Sunday's shoulder (the knuckle showing under the shawl), the bunch of greens, the new saucepan, and the "gee-gee" for Tommy, and relating the week's experience to her friend and neighbour, Mrs. Brown.

Cart traffic is almost out of the question, but occasionally a loaded vehicle enters the street, bound for one of the narrow cross streets. The driver cares little for deranging a stall or two as he turns the corner, and grins derisively at the proprietress, who assails him with a volley of compliments, three-parts composed of words which no dictionary contains—at least, not as bearing the meaning attached to them by the irate woman.

There are many accessories of the strange scene, some enlivening, some saddening. A swarm of half-naked boys rush past us, yelling and hooting, and we have scarcely recovered our footing when we are again jostled—this time by half-a-dozen rough labourers, bearing on their shoulders a plain coffin, which they are taking to the widowed home of one of their mates, and to-morrow will carry, followed by two or three dozen others, to the cheap cemetery, the expenses of which will be met by a "friendly lead," or subscription.

Such are some of the scenes which may be witnessed on Saturday night in a London "poor man's market."

Progress of Chemistry.

II.—THE SACRED ART.

Why did chemistry so long remain stationary, and why has it made such rapid progress within the past hundred years?

To reply to this question, which is applicable to nearly all the sciences, we must place ourselves at a high point of view. Everything reveals the twofold nature of man. Body and mind are equally in want of nourishment; but if this want is a necessity to the first it is only optional to the second. It is to this radical difference that we must trace the two opposite manners in which intellectual and manual labour have ever been treated.

In Greco-Roman society, all the arts tributary to chemistry were exercised by slaves—by beings who, to the citizens of Athens and of Rome, were scarcely a portion of the human race. Whoever manipulated matter to shape or transform it was regarded as unworthy of intercourse with philosophers. An abyss separated the thinker from the manipulator. Under these conditions, any comparison between theory and practice was difficult, if not impossible. To the great injury of science, the artist kept his secrets, and the philosopher his ideas, instead of correcting the one by the other, as they should have done in the interests of society.

It was in this manner that, from the first, the divorce of reasoning and experiment, of theory and fact—those two natural and necessary elements of all progress—was effected.

During the first centuries of the Christian era, chemistry was called the *sacred art*. The priests of Egypt were its first teachers. It was in the temples of Thebes and Memphis that the initiated practised the *divine science*—another name given to the sacred art. Of what was understood by this we remain ignorant; but it appears certain that it consisted of some very simple experiments to arrive at interpretations and doctrines which permitted their dogmatic beliefs to be partly seen.

Let us give some examples:—Water is heated in a vase: the water is converted into steam, becomes impalpable as air, and leaves a powder—

a white earth—as a residue. This was a fact. This experimental fact was as true then as it is now, and as it will be for all time. But what conclusion did the priests draw from it? Why, that water was changed into earth and air—that, in fact, matter was transformed. From transformation to metempsychosis is but a step. This conclusion was perfectly legitimate at a period when they were ignorant of the composition of air and water.

Another example. They burned or *calcined* lead or tin in contact with the atmosphere. The metal became changed into a sort of lime or calx; this was the *death* of the metal. Now, upon taking this calx and heating it with grains of wheat, the operator saw the metal resume its original form and properties. What did they conclude from this fact? That, with the aid of the purifying fire, the grains of wheat possessed the virtue of resuscitating or *revivifying* the burnt metal. Was not this an exhibition of the miracle of the resurrection? It was so believed during several centuries. The vestiges of this belief remain to this day in the terms *reviver, revivification*, employed as synonyms of deoxidise, deoxidisation. Grains of corn were the symbols of resurrection or immortality, as the bags of wheat found in Egyptian mummies seem to prove.

These facts serve to show how prejudicial religious symbolism has been to the progress of science. If they had sought to interpret these facts by means of experiment combined with reasoning, it would probably have not been long before they recognised that the action of the grains of corn revivifying the rusted metals (oxides) is only due to the carbon they contain, and that the white earth which water leaves after evaporation is a residue of the salts naturally contained in the water.

But to arrive at truth man must pass through error. The reign of reason is preceded by that of imagination. The erroneous way of the sacred art was followed by alchemy.

ALCHEMY.

"Everything in Nature is transformed—nothing perishes."

Such is the enunciation of a general fact, which the science of the ancients suspected, and modern science has proved. The alchemists also admitted it; they even established most of their doctrines upon it. But following the example of the adepts in the sacred art, of which the alchemists were only the continuers, they drew erroneous inductions from a few plain experiments.

Thus, for example, lead disappears when calcined in cupels made of ashes, or burnt bones pulverised; only a button of pure silver remains. The operators could not do otherwise than conclude from this fact that the lead was changed—*transmuted* into silver; for they were ignorant of the fact that the calx or oxide of lead formed during calcination is absorbed by the substance of the cupel, and that the small quantity of silver which remains is derived from the naturally argentiferous lead.

The alchemists also knew that *aqua fortis* (nitric acid) dissolves copper, and that when a piece of iron is immersed in such a solution, the copper is revived, while the iron disappears. If we put ourselves in the place of the alchemists, in presence of this fact, so singular in appearance, should we not have said with them that "iron is changed into copper?"

The famous theory of the *transmutation of metals* rests, therefore, upon positive, indisputable facts; but these facts were at that time understood and interpreted differently from what they are at the present day. These different ways of viewing things attest the pre-eminence of thought—at the same time generaliser and rectifier—over irrational observation, or the simple exercise of the senses.

We must not look disdainfully upon our predecessors. If we were in their place, we should deceive ourselves as they did in taking a simple phenomenon of exchange for a transformation. Perhaps they did not attach—who knows?—any other absolute doctrinal sense than we apply to it. To be just towards those who have lived before us, we must in some measure identify ourselves with their thoughts, and not judge them through the prism of the science of our day—that sum total of knowledge slowly acquired.

What might have led to the belief in the transmutation of metals is, that in the absence of all analysis, there were no other means of appreciating their nature except by their aspect, colour—in a word, by the whole of their external characters. The alchemists employed only the balance, and they knew of but a very small number of solvents or re-agents. There is, therefore, nothing astonishing in their having taken, in the best possible faith, chrysocolla for gold.

During the Middle Ages science, like literature, showed great partiality for allegories and comparisons. The alchemists, imitating the example of the Minnesingers, their contemporaries, looked only to the brilliancy of the surface—they rarely went to the bottom of things.

The symbol of gold was the sun. All plants with yellow sap and flowers were supposed to contain gold. Thus, the buttercup, primrose, St. John's wort, the juice of rhubarb, and celandine, played a prominent part in the operations of the *chrysopoets*, or *gold-makers*; such is the name the alchemists bore in the treatises on the *sacred art*.

The animal kingdom also furnished representations of the king of metals, *rex metallorum*. The salamander is represented in certain alchemical books amid a flaming fire, with a golden crown upon its head. It owed this distinction to the yellow spots with which its body is covered.

Sulphur passed for being a marvellous element, less on account of its colour than by its blackening almost all the metals in combining with them. When mercury was made to fall under the form of a fine rain (by passing it through a piece of linen) upon melted sulphur, a black substance was obtained. This substance, heated in close vessels, volatilised without change, and was found to be transformed into a beautiful red material. It was difficult to believe that these two bodies were identical, unless it were known that they are both composed of the same quantities of sulphur and mercury. This faculty of the same body assuming two different molecular states has received the name of *isomerism*, which is a happy abbreviation of a periphrase, but not an explanation.

How this unlooked-for change of a black compound into a red must have struck the imagination of the alchemists! Their allegoric rapture did not slumber. The black sulphide of mercury which, by sublimation, passed to the state of red sulphide (cinnabar) was the *black eagle* which became metamorphosed into the *red lion*. Black and red were symbols of darkness and light—of the good and evil principle.

The fumes of arsenic whiten copper. This fact, known long ago, gave rise to a host of mysterious enigmas upon the means of changing copper into silver. One of these enigmas was attributed to the Sybil. Besides, the word arsenic adapted itself marvellously to the fictions of alchemy. This word, *arsenicon*, in Greek, signifies, literally, *male*. Now, copper consecrated to Venus represented the female principle. White copper, the *silver* of the alchemists was, therefore the product of the union of the male principle with the female principle.

Nature is now as it has ever been. The ancients had the same eyes to see with that we have; but they had not the same way of understanding things. It is the human mind that varies. In their way of conceiving the composition or the molecular motion of bodies, the alchemists have varied, as the astronomers have done in their manner of interpreting the composition of the sky, or the motions of the stars. Whether it be chemistry or astronomy, it is always occupied with the mysterious world of atoms. Magnitude went for nothing: the radiant star and the invisible atom of the crystal were both lost in the infinite.

(*To be continued.*)

Things Talked About.

The extremely practical Emperor of the French, who has discovered that the comfort and prosperity of the working class are fit subjects for a Royal speech, is well seconded by the amiable partner of his Imperial throne. The Empress Eugénie has undertaken to build 300 houses for the working classes, at Montrouge. The rooms will be airy, spacious, well supplied with water, and all the appliances of comfort; and single persons may have lodgings for about £4 a year, and families for £8, £10, or £12, according to the space required. Easy arrangements for paying even such low rents will be made; and if, unfortunately, the money is not forthcoming, there will be no "broker's man," but a simple notice to leave, and the exaction of a verbal promise to pay when times mend. We presume that the houses are intended to be self-supporting; if so, it would be interesting to see the calculations on which the tariff of rentals is based.

Mr. Peabody, with a really colossal generosity, has placed the sum of £100,000 at the disposal of the trustees of the Peabody Fund. His total contribution towards the welfare of the metropolitan working classes now amounts to a quarter of a million. There is a prodigious power of good in such a trust; we most earnestly beg the eminent men who administer it to see that no cause of cavil arises.

We mentioned last week that the Metropolitan Association for the Improvement of the Dwellings of the Industrious Classes had made certain arrangements with the Marquis of Westminster, for the purpose of obtaining a large plot of land. We are now informed of the exact terms of the arrangement:—The terms of the agreement are these: the marquis lets to the association a plot of ground for a term of 99 years, at the merely nominal rent of £40 a year. On this plot the company are to erect suitable dwellings for 149 families. The marquis stipulates that these are to be let at moderate rents, calculated, when all are filled, to produce a net return of five per cent. on the outlay. The requisite capital is to be lent by the marquis to the association on the mortgage of the buildings and land, and he is to receive as interest only three per cent. The remaining two per cent., subject to the deductions incident on change of occupancy and temporary vacancies, is to be retained by the association for the expense and trouble of management. The arrangement is very liberal on the part of the marquis, and shows that when working men are disposed to help themselves, they may expect help from others; and help, too, which involves no sacrifice of independence.

We are glad to hear of the thriving condition of one of the worthiest middle-class institutions of this country, the Manchester Athenæum. At the meeting on Wednesday, the 31st ult., the report of the directors showed that there had been an increase of 190 members on the past year. The receipts had advanced, and the expenses were little more than before. During the year, 44,290 copies of daily and weekly papers, magazines, and reviews had been supplied to the news-room. If the members are not well abreast of the facts and ideas of the day, it is clearly not the fault of the directors. There are nearly 15,000 volumes in the library, and the issues to members had amounted during the year to about 53,000. But notwithstanding this vast amount of literary culture and recreation, the bodies of the members had not been neglected in favour of the brains; for we find that the Gymnastic Club had so advanced in favour, that increased space had been furnished, and the members had carried off substantial honours at various public displays. The Manchester youths are determined that neither body nor mind shall be puny. Nearly twenty-seven years since, Mr. Cobden assisted at the inauguration of the Athenæum; and very soon a fine portrait of the great free-trader, painted expressly for the institution, will adorn its walls.

Prominent among the articles exhibited at the Liverpool Industrial and Fine Arts Exhibition are various articles of drawing and dining room furniture, elaborately carved with historical designs by Colonel Chambers, the friend of Garibaldi. The local critics speak in enthusiastic terms of the talent displayed.

Last year close upon 200,000 immigrants arrived at New York, and of that number more than two-thirds were from the United Kingdom.

An absconding secretary of the Carpenters' Society at Rochdale has been apprehended. His defalcations amount to £54.

The London chair-makers, couch-makers, and carvers are asking for an advance of wages, to the extent of ten per cent. It was stated at a recent meeting that many of the masters were willing to accede to the demand. A trade protection society was formed, and a determination to maintain their ground was unanimously expressed by the men.

The ship-carpenters on the Tyne have ended their strike by a compromise, by giving up their half-hour at four o'clock for tea, and leaving off at five o'clock. The working time is now nine and a half hours. In the iron ship-building yards terms have not yet been arranged.

The mode of paying wages to the workmen employed at the North Engine Works, at Darlington, and at the Shildon Works, on the Stockton and Darlington Railway, has led to a strike, not, however, of long continuance. At Shildon the men are paid monthly, and the times of payment at the other works are irregular. Much inconvenience has been sustained, and the credit system has thriven, to the great disadvantage of the men. A more legitimate cause of grievance has seldom been established, and we are glad to see that a satisfactory settlement has been made.

Some of the Ayrshire colliers are out on strike for an advance; and the iron miners are following their example, supported by the Clyde miners.

The question of the Sunday Evening Lectures at St. Martin's Hall, which have excited some controversy in our columns, is, for a time at least, settled. It has been discovered that an Act of Parliament, passed in 1781, and unrepealed by any subsequent statute, forbids the discussion of subjects bearing on theology and the performance of music by professional singers, and

taking money at the doors, the penalty to which the owner of the place is liable being £200 a day. Of course the proprietor of the hall declines to incur any such risk; and a case will be submitted to the Court of Queen's Bench, to ascertain whether the "Sunday Evenings for the People" come under the operation of the Act. If judgment goes against the promoters of the "Evenings," an endeavour will be made to obtain a repeal of the Act. In the meantime the hall is closed.

Week-day scientific lectures of a popular character, especially intended for the advantage of the poorer classes, are being attempted at Manchester. The first of the series, by Professor Roscoe, of Owen's College, on the elementary principles of chemistry, was well attended, the audience chiefly consisting of the labouring class.

Meetings of the men employed in agricultural labour are still being held in Scotland. One of the latest reported was at Tranent. The place was the Mechanics' Hall, and the object to consider the propriety of joining the Scottish Association, which has originated in Mid-Lothian for the purpose, among others, of raising the remuneration of the hinds in Scotland. The attendance was so numerous that the hall proved sufficient to accommodate only half the number present; and the result was that after the proceedings of the first meeting had terminated, the room was emptied, and the business was gone over *de novo* with a fresh audience. One of the speakers said, that if the co-operative system were adopted in East Lothian, the hinds would, in the course of twenty years, be able to farm half the county. The present system of payment by the half-year, and partly in kind, was heartily condemned, and weekly—or at the most, fortnightly—payments warmly advocated. As in the case of the engineers already noted, the men feel how much they lose by the want of ready money.

Several owners of small house property at Paddington have been summoned for neglecting to put the houses in a habitable condition. They have been allowed a week to complete the necessary work, and in the meantime the summonses stand over. Mr. Giffard, the sanitary inspector, deserves great credit for his activity in bringing neglectful landlords to book.

The Birkenhead Commissioners have made arrangements for the purchase of a site for the erection of public baths. It would be well if other wealthy corporations would follow their example.

General Information.

CLUBS AND INSTITUTES.

Holloway Working Men's Club and Institute.—On Monday, 22nd Jan., the annual business meeting was held. The president, Mr. Alderman Lusk, M.P., took the chair, supported by C. Sawbridge, Esq., C.C. (Treasurer), G. Powell, Esq., and G. Startiu, Esq. (Vice-Presidents), and a good attendance of the members. The chairman was very warmly received, and made a short opening speech full of quiet humour and sound common sense. The Hon. Sec. (Mr. Tattersall) then read the report, of which the following is an abstract:—"The operations of the past year had been marked by steady, if not brilliant success. The following had been the average numbers—

	On the books.	Paid weekly.	Daily attendance.
Summer Quarters . .	168	87	33
Winter ditto . . .	233	123	54

These numbers were somewhat below the previous year, owing mainly to the rigid exclusion of youths under eighteen years of age, but that exclusion had improved the orderly working of the club. The library had been used by 90 members, to whom 404 volumes had been issued. Gifts of readable books would be very welcome. An elocution class, and classes for instruction in reading, writing, and arithmetic, had continued in operation; and a chess club, a boot club, and a temperance association had been formed during the year. Thirty lectures, concerts, and entertainments had been given, and it was gratifying to be able to record a marked improvement in the attendance at the lectures. When first commenced, two years ago, the majority were perfectly indifferent to the lectures, but their interest had gradually increased until now the rooms were frequently crowded. A very pleasant excursion to Petersham Park had taken place in the summer, and two well-attended tea-meetings had been held. A profit of £9 19s. 7½d. had been realised by the sale of refreshments. The income had been £129 13s. 5½d., of which sum £54 14s. 5½d. had been raised within the walls of the club, and the expenditure had been £135 10s. 5d., leaving a balance of £5 16s. 11¾d. due to the treasurer. The most important and most gratifying incident of the year had been a spontaneous movement, on the part of the members, to increase the subscription from 1d. per week and 1s. 1d. per quarter, to 2d. per week, 6d. per month, or 1s. 6d. per quarter. This resolution was not only financially important, but particularly valuable as a conclusive proof of the members' appreciation of the advantages of the club." The various officers for the ensuing year were elected; some alterations in the rules made; and a very hearty meeting concluded with a cordial vote of thanks to the chairman. Before the conclusion of the meeting a liberal donation of £5 5s. from the chairman, with other amounts from various friends, turned the balance due to the treasurer into a balance in favour of the club.

Lightcliffe and Hipperholme Young Men's Society.—This society is situate in a beautiful suburb of Halifax, Yorkshire. The third annual *soirée* has just taken place. The proceedings were commenced with tea, after which the chair was occupied by D. Abercrombie, Esq., a gentleman resident in the neighbourhood. The report was read by the secretary, Mr. J. Crossley, and stated that the society was established nearly four years ago, with about half-a-dozen members. Weekly meetings have been held for instruction, consisting of history, geography, essays, and debates, all of which have proved so interesting, that the number of members is now eighty. In addition, a news-room has been established, and is well attended, supplied with daily and weekly papers, monthly and other periodicals; and there is also a library. Quarterly "coffee meetings" have been held by the members, which have proved immensely successful, and have been the means of drawing away a large number of young working men from the public-house, and providing for them a wholesome means of recreation, amusement, and instruction. The rooms are also open nightly (except Sunday), for reading, chess, draughts, music, &c. During summer a large field near the institution is used for cricket, which has answered the object of keeping the members together, and proved an excellent source of amusement. One remarkable feature of the society is this, that it has been *self-supporting;* for although surrounded by wealthy gentlemen of Bradford and Halifax, the society has not received £6 in donations. Each member pays 2s. a quarter, and out of this sum all expenses have been paid without running into debt. The society has also established annual trips, which hitherto have proved attractive and beneficial. Added to all, classes for teaching reading, writing, and mathematics are held during the winter, taught by members; and it is a most interesting sight to see men from twenty, thirty, and up to forty years of age, sitting down to learn to read. The improvement which has been achieved in these departments is astonishing. Men who, after their day's labour and toil was ended, spent their evenings in idleness and dissipation, are now pleasantly and profitably spending their leisure hours in gaining knowledge. These facts, as detailed in the report, were received with much gratification by a crowded meeting.

Wisbeach Working Men's Club and Institute.—The second anniversary of this society was celebrated on Monday, Jan. 29, by a public tea-meeting and *soirée.* Jonathan Peckover, Esq., banker, president of the club, occupied the chair; and the secretary, Mr. Balding, read an interesting report, which showed a satisfactory state of affairs, though the club is greatly in want of two or three more rooms. Some penny readings in the winter, and a capital cricket club in the summer, in addition to the ordinary operations of the club, have been very successful; a good field for the latter purpose being kindly lent by Mr. Alexander Peckover. A very pleasing and rather novel feature in the evening's entertainment was the presentation of prizes to two young men who had written the best essays for the club, and to two others who had been judged to be the best readers for elocutionary entertainments. The names of the successful candidates were:—Mr. F. A. Baker, printer (first essay prize), read "Union is Strength;" Mr. H. Troll, printer (second essay prize), read "Has the Introduction of Machinery been beneficial to the Working Classes?" Mr. W. T. Streader, first prize for reading; Mr. W. L. Smith, second prize. The man who gained the first prize for reading is a Custom-house officer, and has saved about a dozen lives from drowning. After these proceedings, the Rev. H. Solly delivered an address; and very hearty thanks having been given to that gentleman and the chairman, and to the ladies who presided at the tea (one of whom kindly performed some pieces of music on the harmonium), the meeting separated. An Industrial Exhibition, which is expected to be of a very interesting character, is being organised by the club to open next May. An interesting fact in the history of this club is, that nearly the whole of the labour required for adapting and fitting up the premises was gratuitously given by the working men themselves.

On the following evening, a crowded meeting was held in the Institute Hall, Chatteris, Cambridgeshire, W. Seward Ruston, Esq., in the chair, to hear an address from Mr. Solly on the subject of Working Men's Clubs and Institutes. At its close, a resolution was moved by Mr. Shanks, a carpenter, and seconded by another working man, to the effect that it was desirable that a Working Men's Club and Institute, on the principles of the parent society, be established at Chatteris. This having been supported by the Rev. — Wilson, Wesleyan minister, by A. Fryer, Esq., and by W. Clarke, Esq. (of the bank), was unanimously carried. It was then resolved that all the working men desirous of forming a club should meet in the hall the following evening, for the purpose of appointing a provisional committee. Votes of thanks to the chairman and Mr. Solly having been passed, the meeting, which was considered a highly successful one, then dispersed.

Working Men's Hall, Market Drayton.—The promoters of the scheme for establishing an institution held a preliminary meeting on the evening of January 19, in the National Schoolroom, Market Drayton, the use of which has been kindly granted them for such occasions. There was a considerable number of working men present, and by this class generally the greatest interest is felt in the movement. Dr. Saxton occupied the chair, and his expressions of sympathy and promises of future assistance were received with hearty applause. The following resolutions were adopted unanimously:—Moved by Mr. W. Talbot (a working man), and seconded by Mr. W. Moore—"That in the opinion of this meeting, it is desirable to help the working men of Market Drayton to establish a Working Men's Hall and Institute in this town, upon the principles and with the objects recommended by the Institute Union of which Lord Brougham is president." Moved by Mr. T. Brown, and seconded by Mr. S. Chidlow (a working man)—"That the persons present pledge themselves to use their best exertions to make the undertaking successful, by endeavouring to procure the funds needful to carry on the club with efficiency, and that it deserves the hearty support of all classes in this town and neighbourhood." The resolutions were ably supported by various speakers, and the advantages which would be derived from such an institution by all classes, especially by working men, were dwelt upon at some length. A committee and secretary *pro tem.* were elected; Dr. Saxton consented to act as chairman, to whom a cordial vote of thanks was awarded for his services as president of the meeting. The undertaking is viewed with favour by all classes, and it is hoped that the requisite steps will be at once taken for the successful prosecution of the enterprise.

ART-EDUCATION.

Art in the Workshop.—A very praiseworthy scheme has just been published by a Birmingham firm of goldsmiths. Messrs. Randel have intimated their intention, by circular, to commence a series of drawing and design classes, to be held in their workshops twice a week. Every arrangement will be made to make it a complete studio for the study of drawing and improvement of taste as applied to their various branches—goldsmiths, jewellers, and chainmakers. There will be classes for adults, apprentices, and females. A professional draughtsman and designer will instruct the classes, and the whole will be superintended by a first-class artist. Annually there will be an entertainment in the studio, and prizes of medals, money, books, and certificates will be awarded for industry, drawing, designing, engraving, enamelling, setting, making, &c. &c.; also a discourse on art as applied to trade, with music (vocal and instrumental), refreshments, &c. &c. These arrangements, to be carried out efficiently, will involve considerable expense; but the whole will be free to the students (paper and pencils excepted).

PRIZES OPEN FOR COMPETITION TO WORKMEN.

The Yorkshire Architectural Society, with a view to encourage the study of the principles of Gothic decoration amongst the art-workmen of Yorkshire, propose to offer prizes annually, to be competed for under the following conditions:—1. Two prizes of seven and three guineas respectively, accompanied by certificates from the society, will be awarded to the producers of the two best examples of stone-carving, wood-carving, modelling in clay, or metal-work. 2. For the year 1866, the subjects will be modelled in clay, and may be selected from the following: A capital, a simple boss, a boss for groined-arching, and the filling in of the spandril of an arch. The ornamental details are to be copied from nature, conventionalised to suit the form chosen, and to be adapted to the period of decorated Gothic. 3. The models may be of full or half-size. They are to be sent in, on or before the 1st of June, 1866, addressed to "The Curator, Yorkshire Architectural Society, School of Design, Minster-yard, York." A distinctive mark or motto is to be made on the model: and a letter must also be sent to one of the secretaries, at York, J. Fowler Jones, Esq., Bootham; and Rev. G. Rowe, Training College, containing this distinguished mark, the maker's name, and a certificate from his master, or other credible person, affirming that the competitor is an artisan, and that the example which he exhibits is his own work. 4. The successful competitors are to present drawings or photographs of their models to the collections of the society. 5. The same person cannot receive both prizes. Any further information may be obtained on application to either of the secretaries, at York.

CO-OPERATION.

Barnsley (Yorkshire) Permanent Benefit Building and Investment Society.—This society, which was established about thirteen years ago, is in a very flourishing condition. From the report just presented to the members, it appears that, during the year 1865, 1,126 new shares have been taken, £7,319 9s. 6d. has been received in contributions, £3,207 17s. 3d. in loans, £314 15s. 2d. to the contingent fund; total receipts, £13,215 0s. 9d. Compared with last year (1864), there is an increase of receipts in the following departments:—In contributions, £770 13s. 6d.; loans, £481 6s. 9d.; contingent fund, £103 12s. 7d. In number of shares there is also an increase of 119. During the year 1865,

£6,647 have been advanced to members on buildings, &c., being an increase over the year 1864 of £1,354. Since the formation of this society the sum of £84,770 has been placed at its dispesal, and £41,612 has been advanced to members for building purposes.

Barnsley (Yorkshire) Corn, Flour, and Provision Society (Limited).—The annual report of the above society was issued on Saturday last, from which we learn that, during the year, a large increase in the amount of business done has been experienced. The total receipts from all sources amount to £27,358 5s. 1d.; and the entire profit, after paying all contingent expenses, is £513 13s. 8d., with which the directors propose to pay a dividend of 1s. 6d. per share, leaving a balance in hand of £91 15s. 8d. to carry to next year's account. The company consists principally of working men; and such is the large increase of business, that the directors recommend in their report the erection of additional premises for the better transaction of their widely-extending trade.

Leeds Co-operative Flour and Provision Society.—The balance-sheet of this society has just been presented to the members, and is highly satisfactory. During the past year a great and increased amount of business has been done, and the profits amount to upwards of £3,000, from which the directors recommend a division of bonus of 3s. 6d. per bag of flour, 1s. 6d. in the £1 on groceries, and 9d. in the £1 in the clothing and butchering departments.

Correspondence.

*** *We shall be happy to receive any information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

THE CONDITION OF THE MECHANIC AND LABOURER.

To the Editor of the Working Man.

Sir,—I have with much pleasure read the article "Union amongst Ploughmen," in our paper of the 20th ult., by the Rev. Dr. Begg, and myself being one of the class particularly referred to in the article, I would like to offer a few remarks upon the position we hold. One who has gone through the whole routine of agricultural labour, from scarecrow at 1s. 6d. per seven days' labour, to ploughman at 11s. per week, must of necessity know something of the shifts to which labourers are put. The weary hours spent—Sunday and week-day alike—from light to dark, by the boy from eight to eleven years of age, in frightening away birds from grain recently sown, or ripening, as the case may be, shall be passed over. From eleven to fourteen years of age the boy is expected to assist in work about the homestead, or driving the horses at plough, &c., when more than two are used—his wages from 2s. to 3s. 6d. per week. From fourteen to eighteen he will have to assist the ploughman in cleaning, tending the horses, &c., with perhaps 4s. per week, and standing wages of £2 10s. or £3 a year, to be taken at the end of a year's service. From eighteen to twenty, or perhaps till later in life, he may be under ploughmen at a proportionate advance on the last-named wages. At this time of life, if he be a good workman, he may obtain a situation as head ploughman, with one shilling a week higher wages than the rest of the labourers, on account of having to tend the horses on Sunday. The wages range from 8s. to 11s. a week, being lower in some counties than in others, and varying slightly according to the price of wheat. Now, it will be readily seen from the foregoing, that it is quite impossible for the children of farm labourers in England to obtain even the meanest education. From about fourteen years of age, or when a boy takes what is termed a horse-keeper's place, he will have to rise at half-past three in the summer, and at four o'clock in the winter, clean and feed the horses till six, have a substitute for a breakfast, go to plough or other work with the horses, have another meal at ten—this in the field, or anywhere it happens to be—work till two o'clock, take the horses home, have dinner, attend to the horses the same as in the morning, till half-past five or six, and again from half-past seven to eight, when they will be finished for the night. Now, here is the evening, say from half-past five to half-past seven; the place he will have to sit in is usually a damp, cold, cheerless place, no light allowed, and fuel of the very worst description. If the public-house be near, is not the temptation very great? Besides, if one gets his clothes soaked with wet, as is often the case, how are they to be dried? The writer has worked a very great many times with his clothes soaked with wet from head to foot—has pulled them off at night, put them on again in the morning, very little drier, and this often in very severe weather. This, too, is the case with thousands.

Having referred to the utter inability of our class to obtain education, it is but just to say that evening schools have been established in some villages. But has Government ever offered any assistance, or taken the trouble to inquire at all about the welfare of the agricultural labourer? Nay; for whilst the children of the factory operative and the tradesman have had every means that could be devised to give them instruction, the village evening school has been sneered at in the public papers, the editors of which ought to have known better.

In conclusion, let me offer a little advice. By all means have *Union*. Pay a trifle a week to an Emigration Fund, and let every young able-bodied man who can handle agricultural implements emigrate to any of the colonies; he will there be able to obtain something beside a bare existence, and give his children a decent education. I am perfectly conscious of my inability to produce anything worthy the attention of your readers, but if you can, from these few facts so loosely strung together, deduce anything that would interest any class of your subscribers, you would greatly oblige yours obediently,

A Poor Ignorant Ploughman.

WHERE ARE THE CO-OPERATORS OF LONDON?

To the Editor of the Working Man.

Sir,—As a working man, it is with great satisfaction, that I welcome my namesake, which I conceive will be to him who gains his bread by the sweat of his brow, as the *Times* is to the lawyer or politician. Mr. Editor, as you heartily invite discussion in your columns on all matters affecting the welfare of the labouring classes, I trust many of my fellow workers will avail themselves of this opportunity as I now venture to do.

Sir, where are the co-operators of London? I mean not co-operation among the middle and upper classes, for I see abundance of that in this great metropolis, I mean co-operation among working men. I looked far and near, up and down these busy streets, for a prosperous co-operative store, but looked in vain. When working men's clubs began to spread, methought one of their first fruits was to be co-operation, but the blossom has not yet appeared. I know co-operation has been tried in London, but failed. Why? Because it is false in principle, or because it is a weak ship to venture out to sea in? No, that cannot be, for Lancashire has proved that it is a place of refuge in distress. The philosopher tells us it is sound in principle. The statesman acknowledges that by it the working classes will raise themselves to a higher social position. The divine proclaims it to be a Divine institution. Then who will be bold enough to deny it success, if the working classes take it up and handle it rightly? Where I work, there are five mechanics, three of whom have been members of three different co-operative societies, one of which failed because of mismanagement, the other two failed for want of co-operators. It is said that co-operation is in its infancy—yes, it is all but dead in our midst; and it is a shame to us working men that it is so. Maybe, in some "Toad Lane" in this great London, some score of industrious labourers are striving to realise the "weavers' dream." I am almost certain, Mr. Editor, that among the many workmen of this great metropolis there are as many good co-operators as would form a society in each district, if they were only brought together. The inhabitants of a village or manufacturing town all know one another; but in a large place like this we hardly know our next door neighbour. I trust, however, your excellent paper will be the means of bringing co-operators together. I know six ready to join or help to form a society in the district E.C.—Sir, I am, &c.,

Co-operator.

THE WAKEFIELD INDUSTRIAL AND FINE ARTS EXHIBITION.

To the Editor of the Working Man.

Sir,—Your account of the Preston Industrial Exhibition would lead your readers to suppose that it has been the most successful exhibition which has yet been held; I trust, therefore, you will insert this letter in your next issue, as there is no doubt that the Wakefield Exhibition has been still more successful. For, though the number of persons who visited the Preston Exhibition was 200,050, and the number of persons who visited the Wakefield Exhibition was 189,653, yet it must be remembered that the Preston Exhibition was open 67 days and the Wakefield Exhibition only 42 days; that the charges to the Preston Exhibition were often only 2d. and 1d., whilst the price of admission to the Wakefield Exhibition was never, except on one day, October 16—and that only for the admission of children—lower than 6d.; besides which, whilst the surplus arising from the Preston Exhibition is £2,200, ours will be about £3,000.

Thus, without wishing to detract from the success of the Preston Exhibition, or taking away one iota of praise so justly due to the working men of Preston for the zeal and energy they have displayed, yet we still maintain that the Wakefield Industrial and Fine Arts Exhibition has been the most successful ever yet held, which is more apparent when you consider the large population of Preston, and that Wakefield is only a town of 23,000 inhabitants.—Believe me, yours faithfully, Charles E. Canbridge, M.A.,

January 26, 1866. Gen. Sec.

TRADES UNIONS.

To the Editor of the Working Man.

Sir,—Will you kindly favour me with space in your excellent paper, the advent of which I hail with lively satisfaction, believing that, if conducted in the manner stated in the opening address, it will prove of incalculable benefit to the working classes, and is, in fact, just the paper required by them; knowing that everything concerning their interests will be impartially discussed in its pages, and where they may at last expect to find sound and wholesome advice. In reading your article on Trades Unions, I cannot agree with all the writer therein states. Having had upwards of twenty years' experience in the society to which I belong (the Masons' General Union), I am convinced that its members have far higher and nobler objects in view than the materialism of the advancement of wages, as a glance at the following items, taken from the society's annual accounts, and which are carefully audited each year by three men appointed from the general society, will at once prove—viz., paid to sick members, £32,493 5s. 9½d.; for funerals, £13,545 12s. 3½d.; given to members in search of employment, £30,037 0s. 5½d.; subscribed to hospitals, £900 18s.; paid to eighty-three members, who were disabled by accident from earning their living by working at the trade, the sum of £7,765 17s.; paid to the friends of fifty-one members, who were accidentally killed, the sum of £2,425 6s. 5d.; subscribed to orphan children, £291 19s. 9½d. The above are a few objects of the society, and have been paid since September, 1840, up to December, 1864, which, I think, shows that benevolence is also an object in this trades union. I believe that the working classes of the United Kingdom have been greatly benefited, and are much indebted to these societies for the position in which they are now placed. Having, as it were, been kept in a state of continual warfare in resisting the tyranny of employers, trades unions have not had time to show their usefulness. I believe, with your correspondent, that there is ample room for amendment, such as the establishment of alms-houses for superannuated members, the building of workmen's cottages in large towns, and schools for mutual improvement, where the younger members of the trades may become educated, and would, as a consequence, become better artisans. All these, and much more, may be accomplished by trades unions. With best wishes for the success of your new publication, I am, sir, very respectfully,

A Trades Unionist.

THE PEABODY BUILDINGS.

To the Editor of the Working Man.

Sir,—Permit me to gratefully thank you for the insertion of our letter of the 20th instant, touching the oppressive treatment under which we are smarting from the superintendent of the above buildings; and we wish it to be made known that, so far from any action being taken on the suggestion thrown out of instituting every inquiry, orders have been given for every tenant who signed the letter to be served with notice to quit. Two of them are already served with such notices. Is this the way they expect to retain the decent working men?

Respectfully begging the insertion of this letter, I am, yours obediently, E. Freeman.

Peabody Buildings, Shoreditch,
31st January, 1866.

[We cannot believe that the trustees are aware of the proceedings complained of. Surely they will feel it their duty to investigate the complaints made; and even if they prove to be unfounded, and to have originated only in a litigious or dissatisfied spirit, such a measure as ejecting the complainers should not have been resorted to. The Peabody Buildings are not workhouses, and the trustees are not parochial guardians. If the tenants refuse to comply with any of the regulations of which they were aware when they entered on the tenancy, and by which, of course, they are bound, then no one could complain if they received notice to quit. But for any official to enforce his abstract right of determining the tenancy because the tenants grumble is something very like tyranny, and such a tyranny, too, as the class of persons to whom they must look for tenants are little likely to submit to. We most earnestly call the attention of Lord Stanley and the other trustees to the above and the preceding statements, which, if founded on fact, are calculated greatly to lessen in public estimation the value of the application of Mr. Peabody's most generous gift. If working men feel less at home, less at liberty, in the large blocks of buildings erected for them than in the lodgings and miserable little houses they have left, it is tolerably certain they will prefer the latter. We shall take an early opportunity of investigating and discussing in our columns the whole question of "The Peabody Fund," to which Mr. Peabody has recently most nobly added an additional £100,000.—Ed. Working Man.]

TO CORRESPONDENTS.

Coignard's Centrifugal Pump.—We have received a letter from Messrs. Gwynne, in which they state, "we were not called upon, in 1864 or at any other period, to send pumps of our manufacture to compete against those of M. Coignard or other makers; and no pumps made by us, or under our directions, were, therefore, tried with those of M. Coignard." In our article on the "Coignard Pump," we merely quoted M. Tresca's Report, published in the *Annales du Conservatoire des Arts et Métiers* for January, 1865, which refers, not to any particular pump constructed by Messrs. Gwynne, but to several pumps made on the Gwynne system, which, for aught we know to the contrary, may be of French manufacture, and probably very different from what Messrs. Gwynne would have supplied for the test, if called upon.

Lanfihangel.—The father of an apprentice is answerable to the master for the performance of the covenant by his son, and if the latter leave his service before the expiry of the term of apprenticeship, although he may be twenty-one years old, the master can sustain an action for damages against the father.

Witham, J.—A cheap Brunswick black may be made in the following manner:—Put into an iron pot 14 lbs. of pitch and 14 lbs. of coal-tar, simmer them over a gentle fire for eight or ten hours, and let the mixture stand all night; next morning boil up again, and add, as soon as it boils, 36 lbs. of drying linseed oil, then 5 lbs. of minium and 5 lbs. of litharge, and boil three hours, or until a little of the compound, dropped on a cold slab, will roll between the fingers; then stir in 90 lbs. of turpentine, or more, according to the consistency desired. This varnish will dry in half an hour, and is employed to coat ironwork, &c., before it leaves the foundry, workshop, &c.

W. T. Surgeon.—Your suggestion will be attended to. The Art Directory of the Department of Science and Art contains the information you refer to.

We request Builder and other Inquirers about Books to enclose a stamped addressed envelope, that they may receive a reply through the post instead of in our columns.

W. B. M.—Sovereigns issued by the Sydney Mint do not circulate here. You can obtain their full value at the bullion dealers.

A. M. (Halifax).—We shall be happy to receive the information as to the progress of co-operation in Halifax.

FOREMAN OF ROADS.

Applications, stating age and previous occupation, with Testimonials, for the situation of Foreman of Road Works, will be received at the Offices of the Board of Works for the Westminster District, Great Smith Street, Westminster, not later than Thursday, the 8th February. Wages, 30s. per week.

The person to be appointed must be practically acquainted with the management of macadamised and other unpaved roads.

By Order,
W. P. JEBB,
Clerk.

25, GREAT SMITH STREET,
WESTMINSTER.
31st January, 1866. [1

Working Men's College
BUILDING FUND.

STATEMENT BY THE COUNCIL.

45, Great Ormond Street, December, 1865.

This College was founded in 1854. The students are, for the most part, working men, and the teachers are, in general, members of the Universities and of different professions, or those who have themselves been students in the College. Its purpose was and is to unite these classes together, by associating them in the common work of teaching and learning. It provides instruction at the smallest possible cost (the teaching being almost wholly unpaid) in the subjects with which it most concerns English citizens to be acquainted, and thus tries to place a liberal education within the reach of working men.

In carrying out these objects we have had some measure of success. The number of students was, at the end of the first term, 145; it is now 509. With the increase in the number of students has come an increase in the number of classes, and for some time past we have been sorely pressed for space.

We want chiefly these things:—(1) A room or rooms for the Art Department. [No department of our College has been more successful than our Art Classes, carried on from the first under the general supervision of Mr. Ruskin.] (2) A moderate sized hall or room for general meetings, lectures, and social purposes, capable of containing some 300 or 400 persons. (3) A better room or rooms than we have now got for the Adult School. (4) A room to contain a Museum, and serve as a Natural History class-room. (5) More small rooms for classes.

A site is already provided, the ground in the rear of the house (12,000 square feet in area) being the freehold property of the College. We are advised that such a building as the one we require can be well and substantially built in a plain but good style for about £3,000 to £3,500.

Financially, the College is self-supporting. For several years, thanks to the excellent administration of our funds by a Students' Finance Committee, the income from students' fees has met our current expenditure, leaving a margin available for the reduction of our mortgage debt.

Considering the vast endowments which the benefactions of former ages have provided for the education of the people, endowments to which the wealthiest of us are the most indebted, it would be a disgrace to a wealthy metropolis like this if it were necessary to beg long at the present day for the inconsiderable sum we are now asking for. And the amount of labour and thought which is being voluntarily devoted to the undertaking, and by none more freely than by our students, affords, we think, some guarantee that we shall not misspend what may be given us. Finally, though many a single purse might well defray our needs, we may perhaps especially commend them to those who would be willing to take part in the teaching of this and other colleges if they were not prevented by professional and other avocations. Will they not share our work by helping us to develop it?—Signed, on behalf of the Council of Teachers,

F. D. MAURICE, Principal.

Contributions may be sent to the London and County Bank, Oxford Street branch ("Working Men's College Account"); to the Secretary, at the College (P. O. Orders to be payable to Thomas Shorter); or by cheques payable to the order of the Treasurer, R. B. Litchfield, Esq., 4, Hare Court, Temple, or to any member of the Council of Teachers.

Donations to the amount of £350 have already been received, or promised, including, among others, the following:—

His Royal Highness the Prince of Wales...	£25	5	0
Rev. F. D. Maurice, Principal, from publication of Lectures on the Suffrage.....	100	0	0
Ditto (proceeds of delivery of the same Lectures at the College)	12	7	10
John Stuart Mill, Esq., M.P.	5	0	0
Vernon Lushington, Esq.	50	0	0
Samuel Morley, Esq.	21	0	0
Arthur Cohen, Esq.	10	0	0
Sir Charles Bunbury	5	0	0
Francis Turner Palgrave, Esq.	5	0	0
A. Johnston, Esq.	5	0	0
Hensleigh Wedgwood, Esq.	5	0	0
Sir Thomas Phillipps	5	5	0
Miss Caroline Fox	1	1	0
George Godwin, Esq., F.R.S.	1	1	0
Rev. Henry Sandford	1	0	0
Rev. J. Ll Davies	10	0	0

Practical School Books,

EDITED BY
JAMES STUART LAURIE,
Ex. H.M. Inspector of Schools.

Distinguished by their Attractiveness, Cheapness, and Practicality.

THE STANDARD READING BOOKS, specially adapted to the requirements of the Revised Code, but equally well suited to all classes of English schools.

Improved Editions, strongly bound.

Standard I., 4d.	Standard IV., 1s. 0d.
" II., 6d.	" V., 1s. 2d.
" III., 9d.	" VI., 1s. 4d.

The Standard Primer, 1½d. and 3d. The New Standard Primer, 1½d. and 3d. The Standard Reading Sheets, plain, 3s. 6d. and 6s. 6d. The New Standard Reading Sheets, 2s. 6d. and 5s. 6d.

Now ready, bound in limp cloth,

A CHEAP EDITION OF THE STANDARD READERS, for Rural Schools.

Standard I., 3d.	Standard IV., 7d.
" II., 4d.	" V., 8d.
" III., 6d.	" VI., 10d.

LAURIE'S STANDARD COPY BOOKS. Nos. I. to VI., XIII., XVI., and XVII., are now ready, 2s. per doz.

LAURIE'S WRITING EXERCISE BOOKS. Each Book accompanied by a Handbook containing the lessons for transcription, &c.

Books I. and II. (in one) ... 2½d.	Book IV. ... 4½d.
" III. ... 4d.	" V. ... 5d.
	" VI. ... 6d.

LAURIE'S STANDARD ARITHMETIC. 2nd Edition, corrected and improved. 184 pp., cloth, 1s.; limp, 9d.; or in Two Books—Book I., 4d.; Book II., 6d.; and Parts, 1d., 1½d., and 2½d. each.

KEY TO STANDARD ARITHMETIC. Cloth, 1s. The Standard Arithmetic with Key. Cloth, 1s. 6d.

THE STANDARD MANUAL OF GEOGRAPHY. Cloth, 1s.; limp, 9d.; or in Five Parts, 32 pages each, price 2d.

LAURIE'S FIRST CLASS READERS.

1. Political Economy, 1s.
2. The English Constitution, 1s.
3. A Short History of English Literature, from the Earliest Times to the Present Day. With Illustrative Examples. By Thomas Arnold, B.A. Vol. I., price 1s.

THOMAS MURBY, 32, Bouverie Street, Fleet Street; SIMPKIN and CO., Stationers' Hall Court.

Manuscript Arithmetic. By

a School Manager.

For STANDARD IV.—Book of Examples, price 2d.—Manuscript Exercise Books I. and II., appropriately ruled, with the position and space to be occupied by each sum distinctly indicated, price 2d. each.

For STANDARD V.—Book of Examples, price 2d.—Manuscript Exercise Books I., II., and III., price 2d. each.

Key to Standards IV. and V., price 4d.

These books are published at the request of one of H.M. Inspectors, who has seen the results of their use, during three years, in a School where the Arithmetic has been reported "excellent," and no failures in the higher Standards.

London: THOMAS MURBY, 32, Bouverie Street, E.C. [3

Darnell's Copy-Books. For

SCHOOLS OR SELF-INSTRUCTION.

The first ten numbers of each Series have, on every alternate line, appropriate and carefully-written copies in Pencil-Coloured Ink, to be first written over and then imitated, the remaining numbers having Black Head-lines for imitation only, *the whole gradually advancing from the simple strokes to a superior small hand.*

Large Post, Sixteen Numbers. 6d. each.
Foolscap, Twenty-four Numbers. 3d. each.
Foolscap, Cream Paper, Marble Covers, 4d. each.

"For teaching writing I would recommend the use of Darnell's Copy-Books. I have noticed a marked improvement wherever they have been used."—*Report of Mr. Mayo (N. S. Organiser of Schools) to the Worcester Diocesan Board of Education.*

*** Specimens of other Series, with Leaves and Contents, sent post free on application.

THE WORKSHOPS OF THE WORLD.

THE THAMES IRON SHIP-BUILDING COMPANY.

*Iron Ship-Building.**

THE great sight of the Blackwall Works is, however, the *steam-hammer*—that wonderful invention, without the assistance of which many of our more recent triumphs in mechanical production could never have been achieved. As we behold the ponderous and massive machinery, and become acquainted with its tremendous power, we cannot help recalling the characteristic story of its origin—how James Nasmyth, finding that there was no firm willing to undertake the forging of the great paddle-shaft of the *Great Britain*, and that it was impossible to substitute *cast* iron for *wrought* iron, at last hit upon the invention which has rendered his name famous in

* Concluded from page 82.

the industrial world. Abandoning the old idea of the hand-hammer, of which the tilt, though driven by steam, was but a modification, he devised a steam-giant like that in presence of which we stand. It was very simple, consisting merely of an anvil, a block of iron to serve as hammer, and an inverted steam cylinder, to the piston-rod of which the block or hammer was attached. Like most great inventions, it was wonderful in its very simplicity. The hammer is drawn up by means of the piston-rod, and allowed to fall by its own weight, the operation of rising and falling being conducted with marvellous swiftness—much faster, indeed, when required, than the blows given by the heavy hammer of the most skilful of smiths. Stroke after stroke descends with crushing force and marvellous precision upon the stubborn metal, and in a few moments is accomplished an amount of work which a whole army of smiths could not have completed in as many hours. It was a grand invention, one destined to assist largely in developing the mechanical resources of our country; but James Nasmyth had to share the fate of many other inventors before he could reap the fame and profits of his discovery. Changing their minds, the directors of the Great Western Steamship Company abandoned the idea of making the *Great Britain* a paddle-wheel vessel, and resolved that she should be fitted with the screw. This rendered Nasmyth's invention unnecessary for the moment; and the iron trade being in a bad condition, the unlucky inventor could find no one willing to incur the expense of the experiments necessary for testing its utility in the workshop for general purposes, particularly for heavy work. In vain he pointed out how it must succeed: the iron-masters shrugged their shoulders and turned away. They thought James Nasmyth a man with a crotchet. They little dreamed that his so-called "crotchet" would one day be hailed by them as an indispensable auxiliary in their workshops. Yet so it was. Travelling one day through France, he called at the Creusot Iron Works, the proprietor of which, M. Schneider, together with M. Bourdon, his practical mechanic, had some time previously visited Mr. Nasmyth's works at Patricroft, and had been shown by Mr. Gaskell, Mr. Nasmyth's partner, the latter's design for the steam-hammer. Mr. Nasmyth had been told of this, but the circumstance had slipped from his memory; consequently, when he visited the Creusot Works, he was astounded to find his invention in full work. At first he could scarcely believe it; but he soon understood the true facts of the case; and hastening home, besought his partner to assist him in securing the English patent. He might as well have spoken to the winds; for Mr. Gaskell, alarmed at the fearfully depressed state of business, resolutely refused to advance a farthing; and it was only by the timely help of his brother-in-law that Mr. Nasmyth was enabled to secure the patent. This was in June, 1840. Since then the steam-hammer has become one of the most useful appliances of modern mechanical industry.

At the Blackwall Works there are several of these steam-hammers, each differing in size, weight, and character, and fitted properly for the different kinds of work which they have to perform. The hammer represented in our illustration is used for forging angle and bar-iron, and the comparative ease with which the ponderous masses of almost white-hot iron are brought under the influence of the hammer is truly surprising. A large and powerful crane is first attached to the main portion, or rather that not required to be heated, of the metal. This swings the entire length between the hammer and the furnace; and when the metal is heated to the requisite tenacity, it is swung, by means of the crane, from the furnace on to the anvil under the carefully-poised hammer. A man, elevated some three or four feet, raises a lever, which, admitting the steam into the cylinder, sets the piston in motion in order to raise the massive weight: at a given moment, this weight is released, and descends with a rapidity and power that literally shakes the earthen floor. There is something grand in the contemplation of this latest marvel of mechanical genius and skill. The mighty mass of iron which forms the hammer, and which weighs several tons, is moved up and down as easily as a child would a toy; and is sometimes suspended in mid-air while the iron below is turned or regulated. After the forging process, additional pieces of cold iron are placed upon the metal which has been hammered, and the whole is swung back into the furnace, to be, when re-heated, again subjected to the influence of the steam-hammer.

There is one hammer at the Blackwall Works which strikes blows, each equal to a force of *ninety tons!* This is used for the largest and heaviest descriptions of work; yet so accurately can its action be regulated, that while with one blow it is capable of flattening a bar of iron, with another it will break a nut without crushing the kernel!

The *steam punch* is another interesting mechanical invention. It is used for punching holes in the iron plates, or skins, for the sides of ships. The process in which the machine plays the principal part, is one necessitating the employment of several men. Six men lift the massive sheet which is to be pierced under the machine, while another places under the punch the portion on which it is to descend. In such operations, the plate of metal is previously marked with small circles of chalk on the spots intended to be punched out, the plates being moved backwards and forwards until the work is finished. The holes thus made are for the purpose of receiving the rivets by which the various plates are fastened together. In the larger and heavier plates, much more powerful marking is required.

The *shears* are for the purpose of cutting and sharpening the plates to the required forms—operations which are performed as easily as a lady would cut a piece of linen. The hydraulic machine for the *curving* of the steel plates for armour ships, according to the curve required, is one worth seeing. The plate is raised by means of two sets of chains, coming from one crank or windlass, which is capable of being regulated with the greatest nicety. The peculiar form given to the plate arises from its being placed between the under-surface of the beam and the top of the piston-rod working in the cylinder, pieces of iron being placed upon the top of the plate according to the shape required to be produced, the other portions of the plate being raised up by the top, or cushion, of the hydraulic shaft. The power exerted by this machinery is enormous, the pressure sometimes amounting to a force equal to *one thousand eight hundred and seventy-five tons* on the circular inch! The cylinder is 2 ft. 6 in. in diameter. Well might it have been suggested, during the war with Russia, that the destruction of Sebastopol should have been entrusted to the skill and ingenuity of our mechanicians. Happily, their services are not needed at present in the arts of war.

The *steam drilling-machine* is the next object to be noticed. It is used for drilling holes into the steel armour-plates, a process which is performed in a very easy and rapid manner. The steel plate, four and a half inches thick, is moved upon a railway until it is brought under the drill, after which the hole required to be finished off by the machine is fixed under the small revolving chisel, which is of extreme hardness, adapted to the quality of the plate. The chisel is kept cool by means of soft soap and water, which is poured into the hole, by means of a small pipe, from a movable source. The armour-plates which have to be drilled not unfrequently weigh upwards of seven tons.

The *shaping* of the ribs, or curved iron used for the framework of the vessel, is a curious and ingeniously-performed operation. For this purpose a large iron platform is prepared. This platform is pierced with a number of holes, laid at right angles with each other. The shape of the required curve is chalked upon the platform, and iron brackets, or oblong pieces of iron, are fastened to it by pegs of iron fitting into the holes in the platform, thus marking out the curve to be given to the iron rib. The rib, or girder, is then drawn from a furnace made long enough to heat the whole length of the metal, after which it is placed upon the platform and drawn to the shape marked by the brackets. Men are ready with large hammers to keep it to the proper curve until it cools, when, of course, the required form is retained. Almost every description of curve can be thus produced by this skilful contrivance. Between the different platforms are small open forges, where the iron, when necessary, can be heated, to save the trouble of pulling the whole length.

The various parts of the ship, after being prepared by the different processes thus described, are taken, as required, to the slip on which the future vessel is to be built. Here the massive framework is solidly put together, and covered with a sheeting of iron plates, the whole being completed in a wonderfully short period of time, considering the vast amount of work to be got through. Hour after hour, the neighbourhood of the ship rings with the noise of the hammers and other tools wielded by the various artificers. This continues for several weeks; then there comes a lull, then gay and festive preparations, a launch, and ere long the noble and beautifully-constructed vessel rides the silvery waters "like a thing of life," ready to brave the tempests of the mighty ocean, and to bear its valuable freight to any part of the world which a ship may reach.

Floating Co-operation.

A new species of Co-operation has been set moving in the metropolis. Hitherto, Co-operation has only been found possible in a fixed spot. A stationary store has been formed, and customers have been attracted around it. Lately, however, a species of floating Co-operation has been instituted in London, and which we think may be adapted to the uses of working men.

Some sagacious members of the Civil Service have hit upon the plan of getting their members supplied with all kinds of articles at wholesale prices. They have formed what they term a "Civil Service Supply Association." Each member pays the sum of half-a-crown, and receives a gilt lettered card, which, on presentation at certain depôts, entitles him to be dealt with as a wholesale customer. The leading members of the society go round to certain tradesmen, and say, "We are 20,000 strong; provided we come in considerable numbers to your shop, and make purchases with ready money, will you treat us as wholesale customers?" Tradesmen who agree to do so, are set down in a printed list, which is supplied to each member of the Supply Association, and he, as he has occasion, calls and makes his purchases of such dealers. In this way each member effects a saving of 25 per cent., and in some cases of thirty. He thus becomes a member of a Peripatetic Co-operative Society, whose stores are situated all over the town. The money thus saved in purchases is not saved as in a Co-operative Society of the fixed kind, by allowing the profits to accumulate for future advantage; but the habit of paying ready money and avoiding credit, is confirmed.

Surely something of this nature is possible among working men. If a society were organised by a few intelligent and responsible artisans, it would be possible to find tradesmen in every part of London who would be ready to treat such a body of purchasers, as might soon be enrolled, as wholesale customers. The purchases of the better class of artisans are not despicable—very far from it; their wages, as a rule, rank as high as those of the majority of clerks in the Civil Service. As there exists as yet no great Co-operative Societies in London, it would be desirable to multiply the species of floating Co-operation we have described. Without waiting for the formation of local societies, with fixed stores, it would be an undoubted benefit to convert as many existing shops as possible into virtual Co-operative Stores. A large wholesale trade is often more profitable to a tradesman than a small retail one; and we have no doubt that many dealers would be found willing to enter upon the scheme we suggest. By selecting a limited number of shops in each district, supplying the different articles of commerce generally required, considerable custom could be guaranteed. The benefits of cheapness and quality could thus be secured to the working-class families entering into the "Working Man's Supply Society." The habit of paying ready money would be stimulated by the temptation of cheapness, and the moral deterioration of debt would be gradually corrected in many families where it now exists.

The Australian Gold Coinage.—A proclamation by her Majesty in Council is published in the *Gazette*, declaring that gold coins made at the Sydney Mint shall be a legal tender within the United Kingdom of Great Britain and Ireland, and imposing a charge of threepence per ounce troy of standard gold on the coinage of gold at the said branch mint, being a charge sufficient to defray the expenses of coinage over and above the expenses of assay and refining.

The Cab Trade.

Few persons know much more about cabs than that they sometimes ride in them, and pay the full fare; that they are to be found on the "ranks," and also in the streets "looking out," where they are great nuisances, as helping to block the overgrown regular traffic. Some people affect to believe that cabmen regard society as their natural prey, from which it is both lawful and proper to get as many extra sixpences as circumstances allow. That there are drunken cabmen, dishonest cabmen, and insolent cabmen, are facts as indisputable as that there are sober cabmen, honest cabmen, civil cabmen. Likewise it has to be allowed that there are "frames" called horses, and "dust bins" licensed as cabs, and also that there are strong, fast-trotting animals, with clean, well-kept cabs. To steer a cab through the streets of London requires a clear eye, but no very great degree of education, and it may be fairly questioned whether a like number of men in their condition of life conduct themselves better. Besides which, they are exposed to a good many temptations. All horse business is of a more or less mysterious character, about which exact truth is not easily to be learnt. It is not, therefore, to be pretended that the percentage of profit can be given, though it may be stated that a master who is pretty well up in its details, and looks well after his horses, makes a very fair profit. Like most other trades, it has peculiar risks, and has to face sharp competition.

The system between master and driver is quite different to that between most employers and their men. The cab-owner does not engage so many drivers, and send them forth to earn what they can for them, but lets his cabs to them at so much per day, only short accounts being kept; and then the driver proceeds to do the best he can for himself and family. This system inflicts no hardship on the man, and is a safe protection for the master against short returns. Each party is safe against the other. To carry on anything like a business requires some little capital. The cost of Hansoms and four-wheelers is about the same—at least, within two or three pounds—and averages between £45 and £50. It has been said that new cabs are seldom to be met with; but this idea may arise from the fact that they do not long preserve the lustre and brilliancy of fresh varnish, especially in dirty weather. Three or four days will often suffice to make them look as if they had been used two or three months. The "age" of a cab is to be best judged like that of the horse—not exactly by its teeth, but by its inside fittings and cushions. The time a cab will last depends, in a great measure, on the excellence of its make, and the wear and tear to which it is subject. But in these respects all London cabs are pretty equal; and taking an average, it is found that they are fit to send out for hire for a period of six, seven, and eight years, if they are kept in good repair. At the end of that time they are mostly used up.

Cab manufacture in London is an important branch of trade; for on the first day of the present year there were as many as 6,017 cabs licensed at Somerset House, which would probably give 700 or 800 new ones a year. Hansoms being fast-travelling, and expressly suited for the impatient man of business, as well as pleasanter to travel in on a fine day, are in much greater demand than the old-fashioned four-wheelers. In the day-time, particularly, Hansoms are to be seen hurrying along, and there are several proprietors who do not keep the closed ones in their yards. What was said of the drivers holds good of their animals. There are hundreds of poor, wretched hacks, who ought to have been taken to the knackers' long since; while there are other really sound horses, who are worth £20 or £25. Not long since, one took the writer a fifty miles' journey in the country between two in the afternoon and nine at night, and then went back to his stable with a "go" of many more miles. That was a specimen of the higher grades of cab horses; but he never did any other work, and is not at all exceptional. They are generally about five or six years old when introduced to this life. London traffic, however, is of a very trying and exhausting nature; so that the Hansom horse usually closes his career in this line in about three years. Hansoms knock up much earlier than the four-wheelers, although they generally have a better class animal. In the shafts of the latter, a horse may last five years; when bought, their price varies from £8 to £10, and up to £20 and £25. When the animal has been fairly worked out in this line, he often departs for the country, there to be put to any quiet life, his late owner, perhaps, making £5 out of him. If a cab is only worked during the day, it wants two horses; but if it is going day and night, there must be a relay of three. According to this calculation, it may be estimated that there are some 15,000 cab-horses in the metropolitan district. Fortunately, it is for the interest of the master that he should keep them in pretty good condition, or they would get worked off their legs. A respectable owner stated that his weekly allowance per horse was a sack of oats, a truss and a half of hay, and a truss of straw, besides which there is a charge of, say, fourteen pence for shoeing.

When the driver comes in the morning, he finds everything ready for him to be off to do what he can. He has to pay the owner 11s. or 12s. a day. Sometimes he may not earn nearly so much, while on other occasions, by the help of the extra sixpences, he may clear a good profit. A driver is usually out thirteen or fifteen hours a day, from about nine o'clock in the morning until twelve o'clock or one o'clock the next. If he can, he changes his horse at four or five o'clock. To be perched on the box, or lounging on the cab rank all this time, is not the most comfortable mode of passing life, and keeps a man away from his home and children to an extent that is the reverse of beneficial. If, after he has paid the proprietor, he has 5s. or 6s. for himself, he has done pretty well. It is astonishing that but very few of even the best conducted fully comply with the regulations signed by Sir Richard Mayne. It is provided that a driver shall be fined 40s., or be imprisoned for a month if, when a person hires his cab, he does not hand him a printed ticket containing his number, &c. Now, this is no great hardship, and yet, whoever finds a man doing it? If a person takes a cab, and, in the hurry of business, leaves anything in it, he has the number in his possession, and the man can at once be found. In case of dispute, he is also furnished with the number, and so has not to take it when being abused. In a variety of ways it is a very useful clause, and one which ought to be enforced. There are many other clauses which persons may easily learn, if they will take the trouble to go into a police station, and ask to look at the book.

Of the 6,017 cabs licensed at Somerset House, 2,282 are what are called six-day, and 3,735 seven-day. At one time, there was a much larger number entered as seven-day; and it will be a good thing when they are still further decreased, so that the drivers may, at least, gather their families around them on one day in the seven, or have the opportunity of doing so.

There seems to be no trade organisation amongst the men, and most likely they would not derive much benefit, as "whips" are not at all scarce; for there are twice as many licensed men as there are cabs. The proprietor keeps the licence while the man works for him. The police magistrates, when drivers have misconducted themselves, do not issue summonses against the men, but against the masters, and it is for them to produce the offending party, or his licence, if the former won't appear, when a warrant soon compels him. As it is an uncertain kind of employment in the earnings, so men seldom get grey-headed in one master's service.

THE ELECTRIC MACHINE OF M. HOLTZ.

This new electric machine, devised a long time ago by M. Holtz, an amateur, of Berlin, recently constructed by M. Rühmkorff, and tried for the first time by the inventor, has astonished all who have seen it at work. In effect, although of small dimensions, it gives a greater quantity of electricity than the large ancient ones. Based upon the principle of the electrophorus, it is nothing but an electrophorus working in a rapid and continuous manner.

A disc of thin glass, with both faces exactly parallel, $15\frac{3}{4}$ inches in diameter, is fixed upon a horizontal axis, to which a rotatory motion is given by means of a winch and connecting-strap. In front of the revolving disc, and at a distance of $\frac{1}{8}$th to $\frac{1}{10}$ths of an inch, is placed another disc of glass a little larger in diameter ($17\frac{3}{4}$ in.), maintained in a fixed position by four rings, which slide on four horizontal bars of indurated caoutchouc. On this disc are two notches, wide, and about $4\frac{1}{2}$ inches deep; and at the side of each notch, on each face of the glass, an armature of paper, which does not extend as far as the edge, but only as far as the diameter of the other, or revolving disc; the exterior armatures are $2\frac{1}{2}$ inches broad, and the interior ones 1 inch only. M. Holtz calls a notch and an armature together *an element*.

Each interior armature has also two teeth of paper, which advance towards the middle of the notch. Opposite the revolving disc are horizontal metallic rods, to the free end of which conducting wires may be fixed; the other extremity, which is opposite the disc, carries a metal comb armed with teeth half an inch long. These combs are placed in a line with the armatures. In order to increase the isolating power of the discs of glass, it is well to coat them with shellac varnish.

It suffices now, in order that the armature may become immediately charged by influence, to approach one of them with any source of electricity: for example, a small plate of indurated caoutchouc, previously rubbed with catskin while the turning disc is in rotation. Suppose that one armature be electrified positively, it will re-act upon the turning disc, from which it will attract the negative fluid, the positive escaping by a first conductor. The negative fluid of the turning disc will be in part free and in part fixed by the positive fluid which accumulates on the exterior face of the fixed disc. The attractive influence of this last fluid is interrupted by the notch, and the negative set at liberty by this interruption passes to the teeth of the armature, the rest escaping by the second conductor. The armature is thus negatively charged, and its inductive action is added to that of armature; its fluid repels the negative fluid of the turning disc, on which accumulates the positive fluid, which flies to the points of armature, after having passed before the notch which cuts off the attraction of the opposite fluid. In this manner the armatures charge each other reciprocally, and act the part of condensers. At the same time, a continuous current is established in the wire which unites the conductors. The explosive distance with spherical electrodes is from one to four inches.

The new machine, which furnishes, with very little effort, an extraordinary quantity of tensional electricity, can be employed to produce a host of phenomena for which, hitherto, recourse was had to an inductive apparatus. It produces the stratified light in Geissler's tubes; its current is sufficient to give a sensible shock without a Leyden jar, to deviate the needle of the galvanometer, and to decompose water; brought to bear directly on the skin, it causes a stinging or burning sensation.

The effect, in this machine, is as if the air, confined between the two plates of glass and strongly ozonised by the electricity with which it was at first primed, caused the production at each instant, on the plate communicating with the conductors, of a new provision of positive electricity. M. Rühmkorff has noted that the resistance to the rotation increased considerably after the machine had commenced to give sparks. The production of the electricity required, in fact, some work. The same as in ordinary machines, it is the result of the transformation or the conversion of the motion of displacement into molecular movement.

Masting Ships.—An opportunity has been afforded those who take an interest in the improvement of naval architecture, of inspecting a model of Captain Cowper P. Coles' system of masting ships. The model was exhibited at the entrance to Lloyd's Captains' Room, Royal Exchange. It is called the triped system of masting, from the fact that the trunk of the mast, in addition to its own basis, is supported by two bearers, which gives it the appearance of a tripod. The object of this arrangement is, of course, to strengthen the bearing power of the mast, which it must accomplish in a very high degree. The other advantages of the tripod masts are, that in using them a saving is effected in the wear and tear of ropes, the ventilation of the ship is improved, its speed increased, and voyages thereby shortened, as vessels fitted with these masts are enabled to sail closer to the wind. At the same time, if the necessity should arise, these masts may be cut away as readily as wooden masts.

Mineral Resources of Turkey.—We feel real satisfaction in reporting that the Porte has at length taken a step which seems to indicate some serious intention of dealing with the vast, but hitherto almost useless mineral wealth of the country. A geological survey of the greater part of Roumelia has been decided upon with a view, it is to be presumed, of ascertaining with some degree of scientific accuracy and certainty the probable extent, character, and locality of the mineral deposits of this important half of the empire. With sound wisdom—for which, we believe, Ethem Pacha, the Minister of Public Works, is mainly to be credited—it has been decided to entrust the survey, not, as has hitherto been the practice, to some Hungarian, Polish, or *soi-disant* "engineer," but to a gentleman of high scientific reputation and great practical experience—Mr. Lennox, F.G.S., late of the Geological Survey of Jamaica. Both as a geologist and chemist this gentleman has already won acknowledged rank among our British *savans*, and his examination of the provinces to be visited will, at least, furnish the Government with data of the highest scientific value, be the use subsequently made of the information what it may.—*Levant Herald.*

Lessons in Mechanics.

BY THE REV. PROFESSOR HAUGHTON, M.D., F.R.S., FELLOW OF TRINITY COLLEGE, DUBLIN.

THE celebrated M. Jourdain spoke prose during the greater part of his life without knowing that he did so; in like manner, many of our working mechanics are in the habit of applying the most exact principles of science, in the course of their daily occupations, without ever suspecting it. Long before the science of geology was invented, the practice of applying geological principles was common among canal engineers, quarrymen, and miners; and the laws of mechanics, hydraulics, and acoustics are in constant use, in our own day, among persons who do not know the names even of the sciences whose uses they are familiar with in daily life.

We propose, in the following series of papers, to lay down, in a popular though accurate form, the leading principles of the sciences most commonly applied to practice amongst ourselves, in the hope of establishing more intimate relations between those that are well acquainted with the theory of science, and those that earn their daily bread by the practical applications of that theory to practice.

It has been well observed, by Dr. Arbuthnot, that "it is no small impediment to the advancement of the arts, that speculative men and good mathematicians are unacquainted with their particular defects, and the several circumstances in them that render things *practicable* or *impracticable*;" but it is certainly no less an impediment to the progress of the arts, that those whose duty it is to carry them out into their minute and practical details, are unacquainted with the fundamental laws and principles of the sciences they are daily called upon to apply to practice.

Our object is to supply this defect of knowledge to the best of our ability, and to present to our readers the principles of the sciences reduced to their simplest forms, borrowing our illustrations of those principles from sources familiar to all, and therefore readily appreciated and understood.

We shall commence, without further preface, with Mechanics—the most important of the sciences used in the arts—and afterwards proceed to the consideration of the other sciences on which the material welfare of man is so largely dependent.

All the physical sciences make a direct appeal to some one or other of our senses, in the first instance, and afterwards depend for their development on the application of our intellect or reason to the facts originally supplied by the senses.

These senses were supposed by the ancients to be five in number—viz., smell, taste, touch, hearing, and seeing; to which list our modern philosophers have wisely added a sixth—viz., the muscular sense, or instinctive feeling of resistance when external force is applied. It is necessary, for the development of the respective senses of smell and taste, that external bodies should be directly applied to their several organs in the body; and that vibratory movements of air, or ether, should call forth the peculiar sensations of hearing and vision; while simple changes of temperature are sufficient to excite the sensation of touch in any part of the body endowed with nerve fibres of that peculiar sense.

In order, however, to call the *muscular sense* into play, it is necessary to apply *force* to some one of the muscles, with which the body of man and other animals is covered and protected.

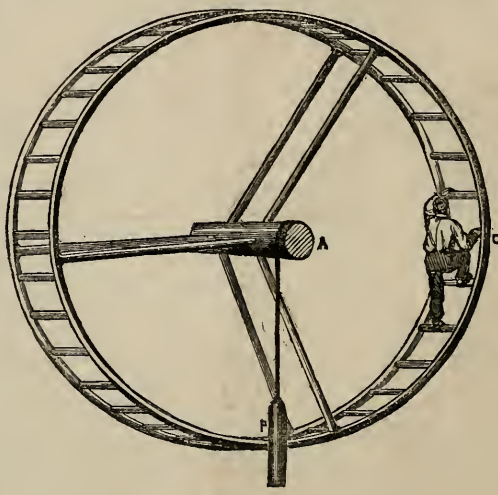
The science of mechanics is the science that investigates the laws of *force*, and applies them to the daily use of man. Of force itself we know nothing, but that it calls forth the resistance of our muscles, and gives us the peculiar sensation of some unknown thing outside ourselves opposing our motion.

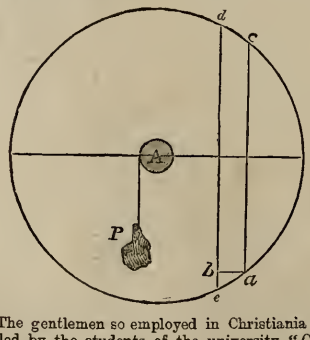
Instead, therefore, of commencing our study of mechanics with the abstract and difficult study of force, we shall begin with the study of some of the well-established effects of force, which are called laws, and leave the investigation of forces, in themselves, to the metaphysicians and mathematicians, to whom it more properly belongs.

The first and most important force we become conscious of is the attraction of the earth we inhabit, by virtue of which all bodies possess weight, and tend to approach the ground, unless prevented by some intervening obstacle, or by the exertion of an equal and opposite force. Hence, it follows that the simplest idea we can have of the effects of the exertion of force is derived from the effort to raise a body from the ground and increase its distance from it.

When we thus raise a body to a greater height than it was before, we are said to do *work*; and the amount of work done is measured by the product of the force exerted, or weight overcome, into the height through which it is lifted. Thus, if 2 tons be lifted through 5 feet, we say that the work done is 10 ft.-tons, or 2 tons multiplied by 5 feet; if 2,000 lb. be lifted through 46 feet, we say that the work done is $2,000 \times 46 = 92,000$ ft.-lbs.; and so on for other cases.

The oldest and simplest forms of machines are those in which work is done, by the efforts of men or other animals, to raise their own weight. The simplest manner in which this kind of work is done is shown in the above illustration, which represents a form of tread-wheel, still used in the city of Christiania, for the purpose of dredging the harbour. In that good city, when the father of a family refuses to maintain his family, instead of being sent to gaol, as in England, to be petted, fattened, and reformed, he is obliged to climb, "with patient step and slow," on the inner side of a dredge-wheel placed in a boat, and as his weight turns the wheel, a rope coiled round its axle pulls the dredge, and helps to clear the harbour.





The gentlemen so employed in Christiania are called by the students of the university "Conscript Fathers;" and as they land, day by day, wearied of their thankless toil, on the fish quay of the city, other epithets—more homely, if less classical—are freely bestowed upon them by the hard-handed and sturdy fishwives of the town. We have replaced the dredge, in the sketch, by a rope sustaining a simple weight, according to the magnitude of which the wheel revolves more quickly or more slowly.

In the accompanying diagram, if *a*, *e* represent two successive positions of the man's foot after having taken an upward step, and if *a c*, *e d* be vertical lines drawn through those successive positions, it is plain that in making a single step upwards the "Conscript Father" has raised his body through the height *e b*; hence the work done by him in making that step is measured by his weight multiplied by *e b*. This work done, if there were supposed to be no friction, or loss of force, in the working of the wheel, would be exactly equal to the work done, as measured by the weight *P* lifted through the height through which the axle A turns while the man's foot descends from *a* to *c*. No matter, therefore, what be the weight *P*, or the diameter of the axle A, the work done by the weight in ascending will be exactly equal to the work done by the man in descending from *a* to *c*. At the next step, he lifts his body again, through the height *e b*, in making the step from *e* to *a*, and is in a condition, by so doing, to cause the weight *P* to be again lifted through the same height as before.

The same mode of applying the labour of man to do work, by raising his own body, is employed in English gaols (or, at least, was until a recent date), in the form of the tread-wheel, which is so well known that no illustration of its action is necessary.

In this machine, the prisoners are placed in a row, on the outer side of the wheel, on a level with its axle, and hold on to a bar placed above their heads, while they climb up the paddles of the wheel, which is itself, by means of machinery attached to the axle, made to pump water, to grind meal, or do other work required in the economy of the prison.

I do not consider the English tread-wheel to be so honest a mode of employing criminal labour as the dredge-wheel of Christiania; for, in the former mode of climbing, as the hands are placed on a fixed bar, it is possible for a cunning convict to support a great part of his weight by his arms, and by moving his legs in time with the other culprits, to appear to do much work, while he really does little. During the course of some experiments made by me some time ago, I had occasion to work with a gang of criminals on the tread-wheel, and was kindly informed by an "old bird," or "Canary," as he was called (whose good office I had secured by a donation of "Limerick twist"), that the best place on the wheel was that next the wall, by leaning against which with the arm and shoulder it was possible to do very little work without being noticed by the superintendent. In the Norwegian tread-wheel, on the contrary, the whole weight of the "Conscript Father," as he climbs, is necessarily employed in turning the wheel, as there are no external objects, as the bar or wall, on which it can be partially supported.

When the English tread-wheel is honestly used, it is found to be as useful a machine as the Norwegian; as a man of average weight (150 lb.), employed on the English wheel, can raise 3,897 lbs. through a foot in one minute; while, on the Norwegian wheel, the same man can raise 3,637 lbs. through a foot in one minute. If the labour be continued for eight hours a day, supposed divided into equal intervals of labour and rest, the total day's work, estimated in foot-tons, is—

Day's Work on English Tread-wheel	417 ft.-tons.
Day's Work on Norwegian Tread-wheel	390 ,,

If a man be employed raising his own weight on a ladder, it is found that he produces 4,222 ft.-lbs. of work in one minute, which, on the supposition of eight hours' employment, half rest and half labour, amounts to the following:—

Day's Work in raising the Labourer's own Weight on a Ladder . . .	452 ft.-tons.

The most economical use that can be made of the labour of man consists in using him to raise his own weight, for in other descriptions of work much of the labour is expended in moving the body from place to place, without accomplishing any useful or productive work. Gangs of labourers have been thus employed on some of the older waterworks, climbing either a ladder or steep staircase, and then walking in upon a movable platform, which descends in consequence

of their weight, lifting at the same time a corresponding quantity of water. This mode of employing human labour has been long since abandoned in every civilised country, as it was found that man might be more usefully, though not so economically employed, by choosing forms of labour in which his intelligence was called into play, and in which he ceased to be used as a mere beast of burden.

It has been found, from carefully conducted experiments, that the work done in raising the weight of the labourer's body on a steep staircase is the same as that done by mounting a ladder, viz., 4,222 ft.-lb. per minute.

(To be continued.)

A SHETLAND SHAWL.

It was made of the purest and finest wool,
As fine as silk, and as soft and cool;
It was pearly white, of that cloud-like hue
Which has a shadowy tinge of blue,
And brought by the good ship, miles and miles,
From the distant shores of the Shetland Isles.

And in it were woven, here and there,
The golden threads of a maiden's hair,
As the wanton wind, with tosses and twirls,
Blew in and out of her floating curls,
While her busy fingers swiftly drew
The ivory needle through and through.

The warm sun flashed on the brilliant dyes
Of the purple and golden butterflies,
And the drowsy bees, with a changeless tune,
Hummed in the perfumed air of June,
As the gossamer fabric, fair to view,
Under the maiden's fingers grew.

The shadows of tender thought arise
In the tranquil depths of her dreamy eyes,
And her blushing cheek bears the first impress
Of the spirit-awakening consciousness,
Like the rose when it bursts, in a single hour,
From the folded bud to the perfect flower.

Many a tremulous hope and care,
Many a loving wish and prayer,
With the blissful dreams of one who stood
At the golden gate of womanhood,
The little maiden's tireless hands
Wove in and out of the shining strands.

The buds that burst in an April sun
Had seen the wonderful shawl begun;
It was finished, and folded up with pride,
When the vintage purpled the mountain side;
And smiles made light in the violet eyes,
At the thought of a lover's pleased surprise.

The spider hung from the budding thorn
His baseless web when the shawl was worn,
And the cobwebs, silvered by the dew,
With the morning sunshine breaking through,
The maiden's toil might well recall,
In the vanished year on the Shetland shawl.

For the rose had died in the autumn showers,
That bloomed in the summer's golden hours,
And the shining tissue of hopes and dreams,
With misty glories and rainbow gleams
Woven within and out, was one
Like the slender thread by the spider spun.

As fresh and as pure as the sad young face,
The snowy shawl, with its clinging grace,
Seems a fitting veil for a form so fair;
But who would think what a tale of care,
Of love, and grief, and faith, might all
Be folded up in a Shetland shawl?

Ventilation of Sewers.—Mr. Bazalgette, the engineer, having been authorised by the Metropolitan Board of Works to make experiments for testing the value of charcoal, or other deodorising ventilators, has made a report, in which he states:—It is necessary that all sewers should have free ventilation into the open air, or the gases generated in them escape through the house drains into the houses, where they become dangerous and offensive; and the experience obtained from the numerous experiments and investigations which have been instituted lead to the conclusion that most of the modes of ventilation referred to may, under favourable circumstances, be applied with advantage in particular cases; but that the most efficacious and most universally applicable mode of preventing the escape of noxious gases is so to construct the sewers that a continuous flow shall be kept up in them, and to provide them with a sufficiently copious supply of water, that the decomposing matter within them shall be diluted and instantaneously removed, and not allowed to settle and ferment in the sewers. Much improvement has already been effected in the ventilation of the London sewers by the abolition of tide-locked and stagnant sewers, and much more may yet be accomplished by the introduction of a more copious supply of water—a *desideratum* greatly needed for the necessities and comfort of the inhabitants of the metropolis.

Art Designs

FOR USE IN TRADES AND MANUFACTURES.

STREET LAMPS.

One of the most unsightly objects in our streets is the common gas-lamp, and the tall slender iron post by which it is supported. Had it been intended to familiarise the eye with forms of ugli-

ness, and thus to debase the public taste, a more efficient mode could not have been desired. A Polynesian savage would have produced something more tasteful, even if more rude, than this—one of the many emblems of our modern civilisation. The old fallacy, that "cheapness is opposed to beauty," lurks at the bottom of the feeling which has tolerated so long these eyesores to the cultivated mind; but when we consider how the commonest articles of pottery or metal-ware made by such peoples as the Etruscans, the Greeks, or the Romans, form the leading models from which our most tasteful and costly articles are designed, it becomes evident that if we wish to promote a taste for art, we must accustom the eyes of the multitude to objects of artistic beauty. But is this done by us? We fear not; at any rate, not to the extent necessary. Yet no one can fail to behold, so far as the metropolis and our leading cities and towns are concerned, traces of a growing feeling in favour of an increased use of art, even in the commonest objects of every-day life. Our public buildings, mercantile palaces, and not a few private residences, are being constructed in a style of taste and splendour utterly unknown to our forefathers. These improvements have led to others, among which may be included more graceful and artistic forms of lamps and lamp-posts, such as that represented by us in our illustration. The shape of the lamp is more effective for purposes of street illumination than that in common use, the light being reflected downwards as much as possible, instead of being lost above, where it is not wanted. The form of the post itself, without losing its lightness of appearance, is suggestive of strength and solidity, and affords an admirable example of what might be done in the way of improving the shape of this, one of the most common of our common things.

Coin, from the Crucible to the Press.

It is intended, in a short series of papers, to explain the various processes through which ingots of gold and silver pass at Her Majesty's Mint, ere they issue from its portals in the form of current coin of the realm, and to give some explanations, also, as to the conversion of bronze bars into the same useful shape. We are aware that there are in existence several works which profess to describe accurately the operations carried on in the national money manufactory, but we also know that they fall short, in several important particulars, of the standard of exactitude which should be the aim of the descriptive writer.

Without entering at present into the history of minting in England, it may be stated that, like many other arts, it has passed through every gradation of improvement, commencing with primitive hand-labour, and ending with machinery of the most perfect kind. Up to the year 1810, the English Mint existed within the walls of the Tower of London. Queen Mary concentrated the small provincial establishments for the production of coin—which, previous to her reign, existed in various localities—into one comparatively large factory, in that fortress, and there it remained till the period named. The mechanical arrangements of the Royal Mint in the Tower were of a very rude kind, and the rolling-mills were propelled to the last by the application of the power, not of steam, but of horses, whilst the presses were worked by manual labour. The inadequacy of the establishment for its purpose had been manifested towards the close of the eighteenth century (1788-9), when Messrs. Boulton and Watt had supplemented its exertions by the production of very large quantities of copper coin, in a very short time, and by the aid of vastly improved mechanical agencies, the invention of Matthew Boulton.

At the commencement of the present century the demand for coin, consequent upon the increasing commercial activity of the time, the development of manufacturing industry, and other causes, was wondrously augmented, and it became clear that a new mint, with improved appliances and fitments, must be constructed if that demand was to be adequately responded to. The question came before Parliament, and after much discussion, money was voted, and Messrs. Boulton and Watt, and Mr. Rennie were called upon to give plans for steam-engines and machinery of sufficient power and magnitude to produce, if needed, a million of coins per week. A site was selected, Mr. Smirke was appointed architect for the buildings, and very soon the Royal Mint, of Tower Hill, came into existence, its total cost being a quarter of a million sterling.

It was during the year 1810 that the first coinage of pence took place, and it was conducted under the auspices of the Company of Moneyers, a corporate body, who claimed the right of coining all the moneys of the state, and dated their origin from the period of the Saxon Heptarchy.* The

* The Corporation of Moneyers ceased to exist in 1851, after a Royal Commission had reported that their charter of privileges was a myth, and the members were permitted to retire with the solace of large pensions for their loss of office.

machinery, thanks to the eminent men who constructed it, proved to be most efficient; and after sixty years of more or less constant action, much of it remains in as sound a condition as when it was first erected. It has poured forth streams of gold, silver, and bronze coin into the channels of general circulation representing an aggregate value of many hundreds of millions sterling, and at this moment its rate of production averages forty millions of pieces of all denominations per annum.

With so much of introductory matter—summarised as far as possible—let us proceed to explanations of the *modus operandi* as exhibited in the daily proceedings of the Mint; and as gold is the most valuable material dealt with, it shall have precedence. The Bank of England furnishes its sister establishment with refined ingots, the value of each of which is £800; and since the Bank is a very extensive customer, it seldom sends forward less than a million's worth of those precious wedges during any one coinage. They reach the Mint by instalments, however, technically known as importations (fourteen of which constitute a million sterling), in boxes placed in ordinary stage wagons, and guarded on their way by clerks and porters from the Bank. Time was, indeed, when a sergeant's guard was necessary for the safe conduct of these argosies through the streets of London. Happily, our lot is cast in brighter days, and the people, better treated, are all the better for their treatment. On the arrival of an "importation," of the coming of which due notice has been given by the Threadneedle Street authorities, the Mint gates are opened by the police, always on duty there, and the gold passed on to the back of the principal building, where is situated the Assay Office. The iron-bound chest is then opened, and the ingots are transferred from it to the department just named. It is in this small sanctum, indeed, that the very first operations of gold and silver coining are performed. A small piece of gold is, in fact, cut from each ingot by force of hammer and chisel, and this in the presence of a bank official. As the ingots are all stamped with distinctive letters, so are the cuttings from them placed in papers lettered correspondingly. The whole are then removed to the scales of the Mint office, and accurately weighed by the deputy-master or his representative. The weight charged to the Mint is compared with the actual weight, and a receipt for the latter is dispatched to the "Governor and Company of the Bank of England." The ingots themselves are next deposited in a stronghold, and the cuttings are carried off by the assayer. It is his province, indeed, to test chemically the exact character of the metal supplied, and to report to the master of the Mint the degree of fineness of each ingot. A copy of the assayer's report is sent to the Bank for comparison with the results of the previously-taken assay at that place. Should the two reports agree—as nine hundred and ninety-nine times in a thousand they do—news of the fact is carried back to Tower Hill, and straightway the ingots are released from their prison-house, and in omnibus trucks conveyed per tramway to

THE MELTING-HOUSE,

where the first step taken is to re-weigh them, and to record their weight in the journal of the department. The assayer's report, indicative of the respective degrees of fineness of each ingot, is now consulted, and sufficient alloy, the purest copper, is apportioned to accompany the ingots into the crucibles, and bring the whole, when molten, to the standard point. It may be as well to state here that standard gold consists of 22 parts of pure gold, and 2 parts of alloy; or, more exactly, of 91·66 per cent. of pure gold, and 8·33 per cent. of copper, in 100 parts. Formerly silver was used as an alloy for gold intended to be coined; but ample experience has proved that an admixture of copper is better—the resulting money becomes harder, and more capable of withstanding the wear and tear of circulation.

In the gold melting-room of the Mint there are seven furnaces arranged in a line, and placed at a convenient height from the floor, the ash-pits being below its level. Crucibles, composed of a mixture of plumbago and Stourbridge clay, are used for holding the metal, and into each of these are placed six of the ingots, together with the amount of alloy necessary for reducing them to standard, and a small quantity in addition, in order to compensate for a loss of alloy which will occur during a subsequent process, to be by-and-by described. Before being so charged, the crucibles are placed on saucers of the same material as themselves in their respective furnaces, the saucers preserving them at the base from the action of cold air. The crucibles are then surmounted by muffle rings of plumbago and clay, and covered by lids of the same composition. The whole are then surrounded with fuel, which, as it burns up from below, heats the crucibles very gradually, and thus averts the risk of their fracture by too sudden expansion. It is not long before the heat of the furnace reduces the metal to a fluid state, when it is well stirred with a plumbago-ended rod, so as to incorporate the alloy intimately with the gold. In a molten state the metal is allowed to remain until it assumes a temperature at which it flows readily, and is likely to form solid bars when poured into moulds. Meantime the moulds themselves are prepared for the reception of the golden streams which they are destined to receive. They are composed of a series of planed cast-iron bars, accurately fitted together, and standing vertically on a carriage, running freely, when required, along a miniature railway. The bars are rebated from end to end, so as to leave a space between each pair for the reception of the metal, and the whole are braced tightly in the frame by set screws. The first set of moulds is now advanced to the front of the range of furnaces, and the first crucible, raised by a simple contrivance, is lifted from its bed of fire, and seated for a moment on an iron platform. The workman clasps it with a pair of tongs, the weight of the whole being partly sustained by a hook and chain pendent from the roof. Carefully and steadily he advances the tip of the crucible to the mouth of a mould, and pours a portion of its contents down the throat of the latter. Soon it is filled, and the crucible advanced to a second, a third, and a fourth mould, which are speedily charged also. The empty vessel is returned to its old position, to receive a fresh batch of ingots, &c., and another loaded one is brought to the mould. Thus the processes of melting and casting go on throughout the day, and not unfrequently a quarter of a million's worth is dealt with between "early morning and dewy eve" at the Mint. It may be observed that a small portion of charcoal is put into each crucible with the gold and its baser companion, in order to reduce any oxide which may contaminate the latter. The charcoal naturally floats when the metals become fluid, and it then preserves the alloy from the action of the oxygen in the surrounding atmosphere. Care is taken in the pouring to prevent any portions of the charcoal passing into the moulds.

(To be continued.)

Seeing the Queen.

"It's five years since the poor Queen opened Parliament," said Nelly, the other evening, as we sat at supper. "Don't you think you could spare an hour or two on Tuesday, Tom? I should so like to see her! It's not the show I want to see—the soldiers, and the carriages, or the rich dresses—but just the dear Queen's face. She has had a hard trouble, Tom, and women—at least those who have good husbands—warm towards her. It will not be the fatigue that will try her strength, but memory."

Nelly's eyes glistened a little, and I noticed that her hand trembled.

"We will go if you like," I said, and then I changed the subject, for I guessed what thoughts were rising in her mind; and, for my own part, though I have struggled to nerve myself for what may some day be inevitable, I shrink from the idea of that chair before me ever being vacant.

I had no difficulty in getting leave for a few hours, and Nelly and I set off for a walk westward. There were hundreds, even thousands, going in the same direction; and I was sorry to see many men whom I know pushing along in their dirty clothes, with unwashed faces, and making a call or two for half-pints on the way. The Strand was crowded with sight-seers—men, women, and children, all eager for the show, and not thinking of the squeezing they would have to endure. I do wonder women will venture into crowds with babies in their arms. It was as much as Nelly and I could do to make our way along, and we were often jostled by rude young fellows, who seemed to find a great deal of amusement in making other people uncomfortable.

We made our way into the Park by the little gate in Spring Gardens, and a real crush we encountered in doing so. Two or three policemen did their best to ease the pressure, but without much effect. "It's as good as the play, especially the squeezing," remarked one young fellow, who seemed to have some gallery-door experience. When we did reach the Park at last, we found ourselves in a crowd indeed. The broad, open area, extending from Spring Gardens to the Parade, was nearly filled with people; and as we drew nearer the line of route, marked out by Life Guardsmen, resplendent in the bright mid-day sunshine, the crowd increased. It was impossible to obtain anything like a seeing position, for the route was lined with a mass of men, women, and children, about ten deep, behind whom were the broad fringe of outsiders pushing and squeezing, vainly looking for openings in the human barrier. In the garden of the Admiralty were raised seats covered with red cloth, and occupied by ladies and children. Every window of the Horse Guards was filled, and on the roof the red jackets of soldiers mixed with the darker dresses of other spectators. Very shaky forms and tables were offered for the public use at sixpence a head; the railings round the trees were loaded with men and boys clinging on despite of nails and spikes; and the hanging branches of trees were seized by London boys, who, with monkey-like agility, hauled themselves up to the stronger branches, on which they sat astride, unmercifully "chaffing" their less fortunately placed or less active companions.

Up the Mall the throng was even denser, being compressed into narrower limits. I was watching, with some amusement, mounted policemen galloping up and down the line, the great Commissioner himself, in cocked hat; busy superintendents; the officer of the day, attended by his trumpeter in full state dress, and perfectly impassive to the popular demand to "blow up;" when Nelly suddenly called out, "Oh, the darlings, there they are!" I wondered for a moment who the "darlings" were; but following the direction of her eyes, I saw at the upper windows of Marlborough House, two children, in the care of smart nursemaids. They were doing just what children generally do under such circumstances—laughing, jumping, and pulling at the cord of the window-blind; and, indeed, the fact that they were little princes—sons of the Prince of Wales and his beautiful princess—did not appear to weigh oppressively on their minds. "Bless them too," I said to myself; "and bless all little children, for the love they bring into a world which wants love."

As carriage after carriage rolled past, bearing sundry court officials, the excitement became intense. Of course, there were plenty of people who declared the Queen was in each of them, and, equally of course, a great many more who contradicted, and knew all about the real state of the case. One authoritative female, who seemed to labour under an idea that the procession to open Parliament and the Lord Mayor's show were identical, settled the matter by saying contemptuously, "The Queen, indeed! Not she. They's the Sheriffs; the Lord Mayor will come presently." I suppose she was disappointed at not seeing the men in armour.

"She wouldn't come at all if she didn't want to ask for some money for some of the young uns," snarled a dirty, seedy-looking man. "I don't want to see the Queen, unless she'll give me a pint of half-and-half for looking at her."

But he pushed and struggled as if he did want to see her; and, indeed, what else did he come for, I wonder? Why some men should take so much trouble to assure others (who can easily guess as much) that they have no ambition beyond a pint of beer, I never could make out. It is not to their credit, and they might do their best to hide the ugly fact.

A good hearty shout for the Prince and Princess of Wales, another for one of the younger princes, and then came the escort of Blues and the brilliant beef-eaters, and the eight cream-coloured horses, with riders in gold-embroidered jackets and caps, and drawing a handsome private carriage, in which is seated the Queen herself. We caught but a brief glimpse of the royal face, but that was enough to set us shouting. The miserable grumblers forgot their cantankerousness; women stood on tiptoes; children were hoisted to shoulders; everybody cheered; everybody, gentle and simple—they were not all working men and their wives who mingled in the crowd that day—

did their best to give a real welcome to the stricken Lady, who once more came among her people as the "Queen of innumerable realms."

Letters from Lancashire, by a Lancashire Lad.

III.—CO-OPERATION IN ROSSENDALE.

The story of the Rochdale Pioneers has been told so often, and so recently, that it must be familiar to all the readers of this Journal. I purpose illustrating the same truths by telling a story, which is not quite so well known, and which, I think, is equally important. It must be as interesting to study Co-operation in Rossendale as in Rochdale, and the student may derive the same lessons from the history of the movement in one place as in the other.

The district of which I speak is one of the most attractive, in its physical aspects, in Lancashire, and a ramble in and about it would be sufficient to enable a visitor from the south to amend his notions of the general appearance of our cotton manufacturing towns. A long valley, in some parts extremely narrow, and at times exhibiting much both of the beautiful and the grand, contains the series of towns grouped together under the common designation of Rossendale. The time was when this valley was so filled with forest trees, that for a distance of four miles the squirrel might flit about without once touching ground. Now, the trees are gone, and the river that watered their roots flows by mill and town; and whilst the eye is occupied by noting the very frequent signs of industry, the ear is filled by the hum of steam-moved machinery.

Bacup is the principal town in the valley, and in it, and the other Rossendale towns, the operatives have exhibited as much of sturdy self-help as has been exhibited by workers elsewhere. It is to be noted that there is here a larger proportion of Lancashire-born people, and a less admixture of Irish, in the population than may be found in the great towns in the northern and southern portions of the county. As in many parts of our manufacturing districts, so here, improvement in sanitary arrangements has not kept pace with the extension of employment and commerce. The Public Works Act—one of the wisest measures ever passed by the House of Commons—has enabled our local authorities so to amend the sanitary condition of the towns, as to considerably increase the comfort of the inhabitants, and, I believe, to add somewhat to the length of their lives.

Just when the spring of 1863 was merging into summer, I was recovering from a very severe illness, and so soon as I was able to go about as a convalescent, I pleased myself by taking a walk through Rossendale. Leaving the train at Rawtenstall, I walked along leisurely through Newchurch and Stacksteads to Bacup. At different stages of my journey I made a pause, calling upon persons whose names I had obtained beforehand. Of these persons I inquired about the growth of Co-operation in the district, and about the effect which the distress, which was then very severe, might produce. My senses, made more than ordinarily delicate by my recent confinement, were pleased to ecstacy with the evanescent glories of flitting clouds, and hill and dale had a new loveliness added to them by the rapid alternations of light and shade which were flung upon them by sun and cloud. The associations of that May-day ramble were such as to impress upon my memory with more than ordinary distinctness the many facts, sad and pleasant, which I obtained.

My information respecting the origin and growth of Co-operation was sufficient to add considerably to the interest which I then felt in the movement. I smiled at some of the diverting incidents which marked its early stages, and, as the story went on, my mind was occupied earnestly in pondering upon the results which were yet to be obtained from the working of a scheme which had even then been so successful. The little thing which had its first practical development amid the extreme suffering and the social turbulence of the Chartist and Corn-law times, was now so grown, that I obtained an account of some twelve or thirteen co-operative manufacturing concerns, having together an enrolled capital of no less than £670,000, and a subscribed capital of nearly half that amount. Remembering that several of the men with whom I conversed, and who were now managers of mills, or independent of any labour, had been poor mill hands in 1842, and that they owed their improved condition mainly to their share in the co-operative movement, I thought then that it would be well if working men in other parts knew the story, and were induced to go and do likewise.

I have frequently thought that those who have had most to say about our working classes, their condition, and the means for its amelioration, have laid too little stress upon the dulness and the stultifying effect of most of the circumstances which have environed them. Critics have written about Burns and his poetry, without giving a single word to what was terribly prosaic in his life. In saying that it is not because of their poverty, but in spite of it, that poetry remains a power amongst the toiling classes, I believe I am but repeating what Mr. Gerald Massey has already said. It is enough to make one shudder at times to consider the many chances there were of his life being little better than brutish, to one chance of its being of a higher character. Refinement of feeling, the power to perceive and appreciate what is beautiful and noble in the shows and forms of Nature, and in imitative and creative art; an interest in, and a comprehension of, the social and political growth of our nation; a knowledge of that literature which contains the wisdom and wit of many bards and many sages—these things cannot fairly be expected in beings whose early lives were spent in unwholesome toil, and in the midst, frequently, of debasing associates. Franklin's rhymed proverb—

> "Early to bed and early to rise
> Makes a man healthy, wealthy, and wise,"

could be said but in mockery to thousands whose toil began too early and continued too late. To be but as their fathers were, inured to hard toil, and too often finding relaxation and pleasure whilst glued to the taproom bench—to be called up from bed so early that the workshop was reached before the head was quite emptied of the fantastic dreams which had filled it in sleep, and to return home late at night, more like a somnambulist than a waking child—such prospects, and such condition, were not likely to inspire either a love of knowledge, or of anything better than what was actually seen to be attainable. And when times were bad there was too little work, where before there had been too much: want stepped in to punish those whom labour had punished before; and somehow it might seem that to toil and sleep, or to play and starve, must in turns be the lot of the labourer. To-day it is difficult to conceive what was frequently the condition and life of children engaged in manufactures before the passing of the Factory Acts. That it was bad—so bad as to justify legislative interference—cannot now be denied.

It was under the harsh conditions which I have attempted thus briefly to describe, that the first co-operators were born and reared. They were heirs, too, to something besides poverty. There had grown up, with the factory system, such an antagonism between class and class, as added considerably to the bitterness of life. That antagonism was increased as the changes of machinery displaced numbers of workmen, and was increased still more by the wickedness of those who, in the fight between Protectionists and the Anti-Corn Law League, sought to make political capital out of the sufferings of an almost maddened multitude. In the manufacturing districts, Chartism arrayed itself with Protection to fight against the League, and League meetings were opposed by Chartists.

Any one who had visited Rossendale in the Chartist times, would have found that political passion was as much roused there as in other places. At Bacup the Chartist operatives had an attic, which they dignified as a meeting-room, and there they met to talk about national as well as local affairs. Many of them were out of work; others had but little work; and even those who were fully employed found that both purse and cupboard were but scantily filled. On idle days some of these men would take long walks on the hills, and then their talk would turn to subjects more immediately important to them than the doings of Parliament, or the effect of the monster petition. Could they do better with the little they possessed? Was it possible that they could mend their own private affairs easier, and at less cost, than they seemed likely to mend affairs that were imperial? Some of these men had a little knowledge of certain socialistic schemes, and thought they saw something in them. One Monday night a meeting was held in the Bacup attic, at which these poor men resolved that they would club together their small funds, and, instead of buying food from retail dealers, they would purchase at wholesale prices, and distribute the provisions, and divide the profits amongst themselves. That was the start of Co-operation in Rossendale. Their first purchase was to the extent of a few shillings; they were a long time before they could muster a pound at once. They could not afford to pay for carriage, so they had to fetch what was bought, from Rochdale or Todmorden, on what they themselves would call "Shanks's pony." It is difficult for me to lay my pen down without expressing, in such words as I may have, my sense of the self-denial and the practical wisdom of these men. If Mr. Carlyle could but have seen them in that Bacup attic dividing the food which two or three of them had carried several miles, we might have had a picture in his "Chartism" which ages to come could not dim.

Working Men's Clubs and Sanitary Improvement.

A sphere of usefulness for Working Men's Clubs, inferior to none that has been entered upon by them, is about being brought under the notice of these associations by the Central Union. A letter by Dr. Aldis having appeared in a daily paper, suggesting the formation of clubs amongst working men for protection against those causes of disease in and about dwellings which are comprised in the existence of nuisances of various kinds—in bad water-supply and sewerage, and in defective arrangement and construction, the executive committee of the council of the union placed themselves in communication with the writer of the letter, with a view to making use of the machinery of existing clubs for an object so thoroughly accordant with one of the primary objects of these societies—viz., mutual help for social benefit. In consequence, Dr. Aldis attended, by special invitation, on the 1st of February, at the monthly tea-meeting of secretaries of clubs and members of the council of the union, to explain his views. There were present of the council, Edward Hall, Esq., and Mr. Bainbridge, besides the organising director, the Rev. Henry Solly; the secretary, Miss Horsbrugh; and Mr. W. H. Robinson, who is acting as secretary to a working men's company now in course of formation for providing improved dwellings. Several of the secretaries present were able to add to Dr. Aldis's statements particulars of cases in which individuals had been powerless to get removed nuisances of the most dangerous character. Fear of being turned out of a house or place of employment, and knowledge of the difficulty of procuring another residence or situation, kept the individual resident or workman from complaining, even though he might know that his health was being impaired day by day. It was admitted, however, that much had yet to be done in disseminating amongst working men a knowledge of the causes of disease, and of the different steps to be taken for their removal; and it was unanimously agreed that the Council of the Union, in co-operation with the Ladies' Sanitary Association (which is devoted to this good work) and with Dr. Aldis, might adopt measures towards the correction of this latter evil, as well as towards the object generally. The course to be immediately taken by the Union is now arranged; and as each of the secretaries present at the meeting at once adopted a suggestion that he should incite his own club to the organisation of means, and to individual exertion, we may hope that the movement of Working Men's Clubs in the way of sanitary improvement has already commenced. Mr. Twining, with his accustomed benevolence, has promised his assistance; and we shall doubtless have more to say of a subject which may well be deemed paramount in importance to working men and their families, as well as to Working Men's Clubs. It was ultimately agreed that the Ladies' Sanitary Association should be invited to print a short paper containing the needful instructions, for circulation among the managers and members of the various Working Men's Clubs in the kingdom. The remainder of the evening was devoted to the consideration of several practical questions.

The Parks of Nature.

London is actually undergoing the process of being built up. If something is not done to prevent further enclosures of open spaces, the metropolis will be in danger of becoming a solid city. The only current of air in London may be said to be made by the rush of vehicles down Fleet Street and Cheapside. A fresh breeze, or the flavour of it, is supposed to come in with the Putney omnibuses. No wonder attention has been drawn to this ossification of the metropolis. A few days ago an important meeting was held in the Mansion House, London, convened there by concurrence of the Lord Mayor, for the purpose of considering how the commons of the metropolis could be preserved for the use and recreation of the people. The Lord Mayor showed his interest in the proceedings by presiding on the occasion. The Lord Bishop of London, Professor Huxley, Mr. John Stuart Mill, M.P., Viscount Milton, M.P., Mr. Thomas Hughes, M.P., and many other socially eminent persons, Members of Parliament, merchants, ecclesiastics, and gentlemen, are associated as the "Commons Preservation Society." Their object is to preserve the commons for the use of the people. The society defines a common to be the "parks of Nature."

For years there has existed in London an Anti-Enclosure Association. It had a secretary, and a few honest but obscure workers upon its committee. Yearly it raised its voice, to which few listened; and working men despaired of ever seeing the cause of open commons taken up as it is now, by persons who have the influence which will enable them to force attention to the subject.

Several City merchants spoke with a loudness and energy of voice which must have satisfied Dr. Lankester, who was on the platform, of the soundness of the City lungs, as well as assured the audience of the earnestness of the speakers. Mr. Scott, the City Chamberlain, showed by curious statistics, that, taking the area of the metropolis at sixteen miles from Charing Cross—which is the Metropolitan Police district—the population of London, in 1801, ranged at equal distances, would stand each man twenty-one yards from his neighbour. In 1851 each person would have stood fourteen yards apart. At present, in 1866, there would only be nine yards between each person; and in fifty years hence, supposing the population to go on increasing at its present rate, and to keep within the sixteen miles area, there will only be standing-room for each person. As in a deluge people climb to the highest pinnacles for breathing space, so, should Mr. Chamberlain Scott's state of things occur, the Londoners will be found clinging to the chimneys for furtive mouthfuls, or lungfuls, of fresh air. As the population now stands it is clear that the metropolitans need all the commons they have.

The splendid commons, or parks of Nature, about London, which have been enclosed, are, it is to be feared, lost for ever. There are a class of persons, known as common-sweaters, who begin by small encroachments—they clip the edges of waste lands, and plead afterwards the rights of appropriation and occupation, from which the poor can never dislodge them.

This new society will be able to command great influence. They propose to obtain parliamentary powers to treat with lords of the manors for the surrender of their rights. Mr. Alcock has generously volunteered to surrender his rights over 800 or more acres, near Croydon. The church authorities of St. Paul's Cathedral are disposed to do the same, where they hold manor rights. The Crown will, no doubt, follow the example. This is a question of the privileges and comforts of the poor, as Mr. Charles Buxton showed, who need commons for the resort of their wives and families, more than the wealthy classes, who can make annual trips to the sea-coasts or the Continent. Mr. Hughes, M.P., said boldly, that he would take the "sentimental side," as it might be called, and contend with an eminent author (whom he did not name) that the love of country in any man was in proportion to the space in it over which he had free and pleasant right of recreation.

Nothing is more uncertain in law than the rights of lords of manors. Ask them to stop a nuisance or remove a dust-heap, and they reply they have no power; but if a speculating builder casts his dangerous eyes over the whole area, the lord of the manor frequently discovers that he has power, or assumes that he has, to let in the masons and exclude a whole population from grounds over which their ancestors trod uninterrupted since the days of the Norman Conqueror. It is only justice to say that many lords of manors are as anxious as any friends of the people that an equitable settlement of manor rights should be made. As matters at present stand, he who steals a goose from off a common is in well-known danger of consequences of the most uncomfortable description; while he who steals the common from the goose is unassailable and unmolestable. The poor, who suffer most by the loss of the common, are in a state of despairing helplessness as to its recovery. We congratulate the working classes on the powerful friends who have now entered the field on their behalf. The day has come—it has been long delayed—when the people have friends. This anti-enclosure movement once successful in the metropolis, will end in saving the parks of Nature of the whole country.

Taste at the Fishmongers' Hall.

A public company has shown public taste, which in itself is notable; but in the case of the Fishmongers, the company has not only shown good taste, it has set an example in the decoration of their official Hall which may have important influence on a great branch of manufactures.

The London visitor who remembers London Bridge has, no doubt, noted, on the right-hand corner of the bridge on leaving the City, a dull, smoke-begrimed, yet somewhat stately, building, in the Grecian style of art. This is the well-known Fishmongers' Hall. Its position, however, is admirable. Of the eighty-two City companies, the Fishmongers' Hall, situated on the banks of a tidal river, alone commands a view of that special element, of whose living wealth this ancient company have hereditary conservancy.

Owing to railway extension, and other artificial and natural developments of the great and increasing fish trade, the old function of the company—that of regulating the profit on the sale of fish—has fallen into abeyance. The "fish inquest"—another of the offices of the company—is still kept up; and two "fish meters" attend the Billingsgate market and inspect the fish, as to its being in a fit state to be sold for human food. It will be to the advantage of the public if this office is strictly discharged, and the company might usefully extend their functions in this direction.

Leonardo da Vinci, the famous Florentine painter, who lived 400 years ago, and whose work on painting has never been equalled to this day, advises students to make a great many studies from nature, with a view to perfect the hand and enrich the mind; but he also urges them not to use these studies for the purpose of original compositions. He insists that fresh studies should always be made of any great picture they may be engaged upon. His meaning is clear. He was fearful that, out of indolence, those to whom he addressed himself might use studies of faces or forms, or landscape backgrounds, not strictly to the purpose before them. As we should say of an orator addicted to a commonplace-book, and who used illustrations because he had them at hand, though not relevant to the argument; whence patchiness, discursiveness, confusion of thought, and defect of force arise.

The example set by the Fishmongers' Company cannot be too widely followed. They required carpets and blinds. The usual course pursued in such cases is to send for an upholsterer, to measure staircases, rooms, and windows, and bring patterns such as he may have in stock. Ninety-nine times in the hundred the worthy upholsterer has nothing suitable, and the owner is constrained to accept the nearest approach he can find to what he wants. The Fishmongers' Company took the right course. They sent for a first-rate designer, and commissioned him to design carpets and blinds in strict harmony with their noble Hall. The result unconsciously presents an illustration of what Leonardo da Vinci described as the success of art.

The moral is, that England, as a manufacturing nation, having to compete with the entire world, the faculty of English invention, and the highest order of taste, require to be cultivated, stimulated, and encouraged, in order that we may maintain a rivalry, if not supremacy.

The carpets at the Fishmongers' Hall have been manufactured of a material known as Axminster pile, by the Messrs. Templeton, of Glasgow. So admirably do they harmonise with the rooms in which they are placed, that they have the effect of a great picture. On reaching the top of the grand staircase, the eyes encounter a perfect sea of crimson and amber, russet and deep madder brown, relieved by lines of blue. Each room is made a place of beauty, delicacy, and loveliness, contrasting strongly with the grim bustle of the road and the river, which the guests look down upon from the window. In what may be called the light-blue room, from the predominance of that colour in it—a room in which ladies must delight, and where, we presume on some festive occasion, ladies are intended to assemble—the sole ornament on the chimney-piece is the long, uncomfortable-looking dagger, with which Sir Richard Walworth, one of the prime wardens of this guild, and at that time Lord Mayor, killed Wat Tyler. This dagger is one of the glories of the guild, which has no bait of hook or other device for fish killing, only this one memorial of Tyler killing. The guild, however, has liberal traditions. It entertained Lord Erskine, Henry Brougham, Joseph Hume, Richard Cobden, Sir Rowland Hill, and General Garibaldi, whose autograph is one of the framed decorations of their entrance room. But the Fishmongers' Guild never placed itself more on a level, or, indeed, in advance of the time, than by calling into their service a distinguished decorator, to give unity of ornamentation to their mansion; and in setting the example of bringing carpetry to the aid of decorative art, and causing the manufacture of special designs, thus opening or encouraging, and certainly tending to elevate, this interesting branch of manufacture. The Owen Jones carpets at the Fishmongers' Hall are now a new thing to see in London. When Cellinis step into the workshops where precious metals are designed, or a Wedgwood calls in the aid of the sculptor, or a Pugin conceives and carries out, not only the erection of a mansion, but its appropriate furniture and ornamentation to every detail—glories of art begin to fill a land, and every workman has a higher place in the ranks of skill who is engaged in executing such designs.

Mortgage on Industry.—Our national debt, in round numbers, is $3,000,000,000, which, divided among 30,000,000 of people, is about 100 dollars a head; the State debt is about $51,000,000, which, divided among 4,000,000 of people, is nearly 13 dollars per head; and our city debt is $41,000,000, or about 41 dollars per head. This makes a total of 154 dollars for each man, woman, and child, in the city of New York. As not over one person in six is a labourer or creator of wealth, it follows that each actual producer is saddled with a debt of 1,000 dollars, upon which he must pay interest for the rest of his life. The prospect is not a pleasant one for the labouring classes.—*New York World.*

THE DRILLING MACHINE IN USE IN THE MONT CENIS TUNNEL.

Diamond Drilling Machine,

EMPLOYED IN EXCAVATING THE MONT CENIS TUNNEL.

The simplest method of drilling rocks consists in employing a bar of iron as the boring tool. Every time a blow is struck on the end of this tool care is taken to turn it partly round, and to withdraw the fragments from the hole made as frequently as possible. This process is a very slow one. The depth of a hole made during a day with a bar will vary from 12 to 32 inches, according to the hardness of the rock.

M. Leschot has conceived the idea of substituting for the ordinary iron bars, for boring hard rocks, rotary tools acting like an annular conical head, in which the steel teeth are replaced by diamonds.

The apparatus consists principally of an iron tube, at the extremity of which is a steel ring, in which black diamonds are set, projecting from the surface—some within, some without, and others a little in advance of the front edge. A rotary motion is given to this tube, with a greater or lesser pressure against the rock, which is broken up and bored wherever the diamonds touch it. An india-rubber pipe, or even the iron tube containing the perforator, carries a stream of water of sufficient force to wash away the fragments of rock which remain in the interior of the tube, as witnesses that they are easily removed.

With Leschot's borer, a hole of 2-10ths of an inch in diameter, and nearly $3\frac{1}{2}$ in. in depth, can be made in a hard rock in the space of an hour. It is employed in the Mont Cenis Tunnel, and other similar works.

The cost of this tool is not, as might be supposed, any obstacle to its employment, for the only use that has hitherto been made of the opaque black diamond is, in a state of powder, to polish transparent diamonds. It is very little worn in boring rocks. When no longer available for that purpose, it is withdrawn from the steel ring in which it is set, and may be sold at a slight reduction on its original cost, proportionate to the reduction in weight. A steel ring mounted with black diamonds, which will serve to make holes of $1\frac{1}{2}$ in. in diameter, costs from four to five pounds.

The Leschot borer is now being employed in boring into a talcose rock of extreme hardness in the tunnel at Port Vendres, in the south of France. Before employing this tool, two miners could, with much difficulty, only make a hole of $1\frac{3}{4}$ in. in depth in two hours and a half; the same work is performed by the diamond borer in twenty-one minutes. A dozen such holes are made in a day. The expenditure of water is less than six pints per second, the fall about 100 ft. The water motor is the invention of M. Perret, civil engineer; it is very simple in construction, and has replaced steam and compressed air as a motive power in this work.

The Textile Manufactures of England.

BY WILLIAM ROSSITER, FELLOW OF THE WORKING MEN'S COLLEGE.

I.—INTRODUCTION.

In the preface to his history, Stow remarks that every five hundred years a great change had taken place in the English nation. In saying this, Stow was not twisting facts to suit any pretty theory of his own; nor making too much of small changes because they happened near particular times. The changes of which he speaks were the cardinal ones of our history. The beginning of the history of England is coincident with the beginning of the history of Christianity; for then its exact locality was first made known to the world, and it was brought into the general current of history.

Five hundred years afterwards the ancient inhabitants were driven from their homes, the rude

ancestors of the present generation of Englishmen taking possession of the land, and making it their own.

After another five centuries came another race of conquerors, crushing for a time their Saxon brethren, but eventually uniting with them to form one people, in whom the rude strength and vigour of the Saxon, polished by the vivacity and grace of the Norman, should form the groundwork of the national spirit.

Another period, and Saxon and Norman, now alike Englishmen, with a common language and common national feeling, achieve for themselves a national faith. It is at this time that the history of England, as the history of a full-grown nation, taking its part in the world's work, fairly commences.

In the first of these periods, when the Roman ruled the land, it was fitted to be the dwelling-place of a civilised people: then roads were made, houses built, agriculture extended farther in than the coast, and mining first became a little worthy the name.

In the next, the Saxon period, our ancestors, who came as pirates, remained to become settled inhabitants of a land they called their own. They were preparing to become a nation worthy of a history, and laying the foundations of the English language and the English nation.

In the third period the Norman came, receiving strength where he gave grace and polish. Now was built, on the Saxon foundation, the nation which, at the close of this period, took that place amongst the nations of the world which less than half another five hundred years sufficed to make so glorious.

If the English people have thus a character of their own, so, also, has their country. The history of English manufactures and commerce is the history of a land and of a people worthy of each other—a land of boundless riches and fertility, worked and tilled by a people of steady energy and unwavering perseverance. The story how England has risen to her present greatness as a manufacturing and a commercial nation, long and varied as it is, is but the repetition of the same theme—the overcoming of obstacles by steady and long-continued exertions.

At the beginning of the story, we sell the wool off our sheep's back to foreign weavers, and then buy it back again, giving them our corn and tin for weaving it; but at the end of the story, we not only use up our own wool, and buy more of other nations, but we buy, in addition, four-fifths of the entire cotton crop of the whole world, and by means of machinery, unequalled for extent and power, make it into clothing for every nation on earth.

The chief textile manufactures of England are those of wool, of silk, and of cotton. The first is by far the oldest, the last by far the greatest. The first dates back even before the Roman time, the last scarce 200 years. The great steps of these manufactures are the following:—

WOOLLEN.

Dates back to before the Roman conquest.

A.D.

1100.—Settlement of a body of Flemish weavers in England.
1322.—The first mill in Manchester.
1331.—Edward III. invites a second body of Flemish weavers.
1337.—Prohibition of foreign-made cloth.
1614.—Invention of West of England mixture cloth.
1650.—Export of raw wool prohibited.
1668.—The finest wool still made by foreigners.
1780.—About this time machinery first applied to woollen manufacture.

SILK.

1363.—First mention of silk, in an Act of Parliament.
1585.—A great number of silk weavers settle in England, on Antwerp being plundered by the Spaniards.
1595.—Stocking-frame invented.
1685.—Great numbers of French weavers settle in England, chiefly Protestants exiled from France by Louis XIV.
1719.—First silk mill in England.
1765.—Foreign silk prohibited from entering England.
1826.—Importation of foreign silk allowed, upon payment of heavy duties.

COTTON.

1641.—Cotton first mentioned as being spun in England.
1767.—Invention of the spinning-jenny.
1769.—Invention of the spinning-frame.
1773.—Goods first made entirely of cotton.
1775.—Invention of the mule-jenny spinning-machine.
1787.—Invention of the power-loom for weaving.
1791.—First importation of American cotton.

These, the cardinal events of each manufacture, show the difficulties that our ancestors had to overcome—how they required foreign teachers, and thought they required protective prohibitions; also how, by hard work, they did overcome all their difficulties, and when they had learnt to spin and weave well themselves, made iron spinners and weavers, which should do these things even quicker and better still.

The Britons spun wool, as they mined for tin and copper, in a manner as rude as it was limited. Under the Romans they did both better. The Saxons did them first worse, then better than the Britons. The Norman kings encouraged the spinners and weavers as well as they knew how. In 1100 a great number of Flemish weavers, washed out of their home by an inundation, came to England for a new home. They could fight as well as weave, were strong as dexterous, and Henry I. placed them at Carlisle, where they might spin, and weave, and fight the Scotch; afterwards they were removed to the west, about Gloucester, as an advanced guard against the Welsh marauders.

In 1331 Edward III., who had married a Flemish princess, invited over a fresh body of weavers, whom he settled at York and other northern towns—where their descendants are now—encouraging them in every way he could both by bounties and prohibitions of other goods. The manufacture increased in quantity and improved in quality, but for the next three hundred years the best cloth was still made abroad. In 1614 the method of mixing two qualities of wool was first tried in Gloucestershire, whence it derived the name of West of England mixture. This was a decided improvement; but it was not until machinery was applied to both spinning and weaving wool that the manufacture became at all equal to foreign work.

The silk manufacture, unlike the wool, is of foreign origin, having been first introduced into England about the end of the fourteenth century. The earliest mention of it known is found in an Act of Parliament of 1363. In 1585 the town of Antwerp, then the great emporium of European commerce, was besieged and plundered by the Spanish troops. Great numbers of the inhabitants left it, and a large body of the silk-weavers came over to England; and in 1685, exactly a century afterwards, a still greater number of weavers, chiefly Protestants, came over from France, upon Louis XIV. revoking the Edict of Nantes, by which he had previously granted toleration to his Protestant subjects. Both these immigrations, but especially the latter, did very much to improve the silk manufactures of England. From this time until 1826 silk woven abroad was prohibited from entering England, and the manufacture suffered the usual fate of protected trades—making but little progress until these prohibitions were removed. The chief improvements of the silk manufacture have been made of recent years, since it has felt the good of free intercourse with other nations.

The cotton trade, the most gigantic, is, also, the youngest. It was not until the middle of the seventeenth century that cotton was at all known in England. It was then brought in very small quantities from Cyprus. The manufacture made but little progress, comparatively, until the invention of the spinning-jenny, in 1767, increased the quantity, and that of the spinning-frame, in 1769, improved the quality, that could be spun. In 1773, owing to these improvements, goods were for the first time made entirely of cotton, instead of mixed cotton and linen. The invention of the mule-jenny spinning-machine, in 1775, made a still further improvement in both quantity and quality, combining in itself the advantages of both the preceding inventions. More cotton was now spun than could be woven: attention was thus directed to improving the existing weaving machinery, and in 1787 the power-loom placed the weaving power on a level with the spinning. In 1791 the first cargo of American cotton was received, and good raw material was now as plentiful as the power to use it.

From this date the cotton trade has steadily increased with a rapidity quite surprising, until the reasons for it are considered. The manufacture has all the elements of success. An abundant supply of easily-worked raw material, unequalled power in working it, and a manufactured article eminently suitable for cheap and comfortable clothing and for a thousand other purposes, in great demand in every civilised country, are ample data to account for even the stupendous magnitude of our cotton manufacture.

All the great inventions, the enormous capitals, and gigantic factories upon which the manufacturing prosperity is founded, are things of the last hundred years; but for the causes of which these are but the results, we must trace back the story both of England's people, and of England itself. We must go back even to the times when the land had no human inhabitants.

In the far-off times, when a few fishes and a reptile or two formed the highest order of life upon the earth, the trees that in their present form work our gigantic systems of machinery, and enable our railways and steam-ships to do their work, were seen spreading their giant boughs to the light of heaven. We spin and weave our wool and cotton, and our ships carry us far over the ocean, by burning the coal which grew as trees upon this fair island ages before Cæsar and his legions trod its shore.

*Poems. By Matthias Barr.**

The social and intellectual progress of the industrial classes is abundantly typified by the general character of the poetry produced by such men as Ebenezer Elliott, Gerald Massey, Samuel Bamford, John Clare, and the crowd of other children of toil who have glorified labour with the bright crown of song. We no longer picture to ourselves the poet as a poor and miserable author, pining in a Grub Street attic, or passing his days in the Marshalsea prison. No, nothing of this. Our modern poet is, in many cases, one of those sturdy-minded and thoughtful artisans who, instead of fretting themselves because the path of life is not always strewn with roses, boldly take things as they are, and sensibly determine to make the best of them. Such a man is Matthias Barr. True, he does not tell us he is a working man, but the fact is revealed in every page of his little volume. None but a working man could have sung as Matthias Barr has done of working-class life. He is a reader, too, or he would not have told us of his love for books; how they "come with the sunshine of love in their looks to gladden and brighten" him after the toils of the day. Like Gerald Massey, the intensity of his sympathy with the sufferings of the poor has led him into an occasional bitterness of expression; but the cloud soon passes away, and we find the poet singing—as the true working man poet loves to sing—of his household joys and happiness. He loves the little ones—what true poet does not?—and to one tiny darling, who possesses the silver key of his heart, he thus sings:—

LITTLE THINGS.

Little eyes, little eyes,
Twinkling, star-like, on the sea
Of all our troubles, all our sadness,
Heaven-born lights are ye.

Little feet, little feet,
Falling on our humble floor,
Bringing faith, and hope, and gladness,
Where doubt was before.

Little hands, little hands,
Softly, meekly, clasped in prayer;
Pleading at the gates of heaven
For the loved ones there.

Little heart, little heart,
Beating out the golden hours,
Coining all that life hath given
Into buds and flowers.

Little thoughts, little thoughts,
Working in that little brain;
Restless, endless thoughts a-sowing;
Seeds for joy or pain.

How I love ye! how I love ye!
Tongue can never tell how much!
Life is doubly worth the knowing,
When we live for such.

But Matthias Barr is not so selfish in his domestic felicity as to forget his duty to his fellow-toilers, who oftimes need so sadly a word of kindly cheer as they press forward in the fierce and unceasing battle of life. For them he has honest and glowing songs of hope and cheer, such as the following:—

* "Poems." By Matthias Barr. London: Longman and Co. 1866.

GIVE ME YOUR HAND.

Come, give me your hand, sir, my friend and my brother,
If honest, why, sure, that's enough;
One hand, if it's true, is as good as another,
No matter how brawny or rough.

Tho' it toil for a living at hedges or ditches,
Or make for its owner a name,
Or fold in its grasp all the dainties of riches,
If honest, I love it the same.

Not less in the sight of his Heavenly Maker
Is he who must toil for his bread;
Not more in the sight of the mute undertaker
Is majesty, shrouded and dead.

Let none of us jeeringly scoff at his neighbour,
Or mock at his lowly birth.
We are all of us God's; let us earnestly labour
To better this suffering earth.

With this, we take our leave of Matthias Barr, trusting that he may live to produce many more such volumes as that which elicited our fullest meed of approbation.

The London Association of Foremen Engineers.

WE have pleasure in placing before our readers some details of the rise, progress, and present position of this society. Like many other institutions now in flourishing and useful existence, the Association of Foremen Engineers owes its creation and establishment to the active minds and energetic labours of a few men.

On certain evenings of each week, during the winter of 1851-2, a knot of about half-a-dozen intelligent-looking men might have been seen occupying a "box" in the public room of a coffee-house in the bustling locality of Clerkenwell, and they were generally engaged in earnest conversation. They met by appointment, and the subject which occupied their attention was a suggestion made by one of their number—Mr. George Sheaves—for the formation of a Benevolent and Scientific institution, to promote the material and moral interests of the class to which they all belonged—that of foremen engineers. It was felt rather acutely that that class was, to a considerable extent, in an isolated and, therefore, unsatisfactory position. In the factory they occupied an intermediate place, and were required to be on a friendly footing both with masters and men, without favouring either unduly. Out of the factory they found it inexpedient, if not impossible, to hold free communion with either their superiors or subordinates, whilst they had no bond of union or tie of friendship among themselves: hence the inconvenience and awkwardness of their own social condition.

Foremen engineers, however, are trained to meet and, if possible, to overcome difficulties, moral as well as practical. Exertion and self-reliance, humanly speaking, are their inheritance—bequeathed by earlier engineers who have achieved peaceful triumphs, and left deep "footprints on the sands of time"—and in the workshop they find ample opportunities for the employment of their share of the property. The primary difficulty which had to be encountered at the Clerkenwell meetings was less mechanical than moral. It was no less than the hostility of employers to the realisation of their project, and this important point was the subject of many an evening's anxious deliberation in the coffee-room box. The foremen had determined by resolution that an association should be formed. They named a chairman and a secretary, and at once proceeded to frame a code of rules for the government of the embryo society. The problem next to be solved was, how to avoid offence to the heads of engineering firms, and yet to advance their own order morally and intellectually by association, and this was by no means a question easy of solution. The very idea of a combination among any class of employés was at that period—when strikes were rife, and disastrous in their effects—simply hateful to employers. In their eyes the really innocent meetings of the foremen assumed an alarming aspect, and in some instances dismissal was threatened as the punishment of those who attended them.

Conscious of the injustice of the masters' suspicions, and certain that as they were unjust they would be shortlived, the founders of the association persevered in their work. By the month of March, 1852, they completed a draft copy of rules for the management of the association, and shortly afterwards the rules were printed and circulated. The enactments were of a nature to disarm opposition, for they were entirely of a benevolent and scientific character. Employers were by one of the regulations invited to become honorary members, with the privilege of attending every meeting, and the discussion of the politics of trade was expressly and authoritatively forbidden under any and all circumstances. Interference in questions relating to arrangements between master and servant was interdicted on pain of expulsion; and, in short, every possible ground of apprehension on the part of employers was completely disposed of—as it was imagined.

The association was now fairly launched, and the coffee-house frequenters were no longer to be met at the accustomed spot. We give their names, as a necessary and just accompaniment to this slight historical *resumé* of their persistent and successful labours. They were—George Sheaves, Thomas Allison, John Briggs, John Ellis, James Hosken, W. Ross, J. Marrow, George Tillot, and William Keyte.

Advancing now to a later period in the annals of the society—the year 1859—and we find that not much improvement in a numerical sense had then been made. The number of ordinary members was twenty-two, and scarcely a single engineering employer had enlisted in its ranks. Its meetings were nevertheless held, as they are now, on the evening of the first Saturday in each month, and those who attended them speak highly of the practical discussions which then took place. Papers, too, were occasionally read, and the association had taken something like a firm standing among its scientific fellows in the metropolis. It had not outlived as yet the fears of master engineers, but it had its own innate vitality; its rules had worked well, and it reckoned in its ranks representatives of some of the principal London firms.

At this juncture its first chairman, Mr. Sheaves, and who had held that post hitherto, died—to the intense regret of the associated foremen. In February of the same year (1859), Mr. Joseph Newton, of Her Majesty's Mint, was unanimously elected as chairman. This gentleman, who had for some years previously taken an active part in the proceedings of the association, now redoubled his exertions, and devoted himself, in the first instance, to the dispersion of those clouds of not unnatural prejudice which had obscured the vision of employers. Personally he invited them to attend the monthly gatherings; he caused reports of the meetings to appear in the scientific press; superintended a revision of the original rules; and, in short, may be said to have infused new life into the institution. The consequences soon became apparent: employers came in, foremen who had timidly held aloof followed their example; the "Transactions" increased in interest, gained a wider range of readers, and the harbour of prosperity was more nearly approached than it had ever been before. Larger rooms were taken, and, at length, a well-known employer, Mr. Henry Grissell, consented to preside at an anniversary festival of the society, held at Radley's Hotel, in 1864. Mr. Grissell, on this occasion, was supported by other gentlemen of eminence in the engineering world, and the turning-point between the struggle for and the achievement of success was passed. Last year, Mr. John Penn, C.E., occupied the chair at the annual dinner, and 250 members and friends of the society supported him. On Saturday next, the 17th inst., Mr. John R. Ravenhill, C.E., will succeed Mr. Penn, and there can be no doubt that, in the future, the anniversaries will be furnished with chairmen of nearly equal eminence.

The number of members at present connected with the London Association of Foremen Engineers is 145; the amount of money in hand for meeting current expenditure is £438; and the master engineers of London have subscribed no less than £600 as a Superannuation fund for aged and necessitous foremen, being members of the society. This may be surely termed a satisfactory state of things, as it is a legitimate reward for exertions which have from the first had but one object—that of rendering service both to foremen engineers and their masters. It only remains to summarise, for the advantage of the readers of the WORKING MAN—many of whom we have reason to know are engineers—the rules of the association to which we have at some length referred.

The qualification for ordinary membership is that of having held the post of principal foreman or principal draughtsman in any branch of the engineering trade for two years previous to candidature. The amount of subscription after election is nine shillings per quarter, and there is an entrance fee of one guinea. The advantages are those of attending all meetings, receiving one guinea per week for sixteen weeks, if so long unemployed, and that of having the co-operation of all members in obtaining new employment. Honorary members are admitted on payment of five guineas in one sum, or of one guinea per annum. Engineering employers are especially eligible for this class, but other gentlemen are admissible, and among those at present so attached are the editors of nearly all the scientific publications in London.

At the last annual meeting, held on the 6th of January, Mr. Joseph Newton was, for the eighth time, re-elected to the office of president of the society, although he made a strong effort to escape from the trammels of office. Mr. David Walker (of Messrs. Maudslay, Sons, and Field's) is the efficient secretary.

We cannot do better than conclude this sketch in the words of the preface to the society's rules:—"The association has no secrets, but courts complete publicity. . . . It essays to assist its members in faithfully and creditably filling the important posts confided to them, to relieve them when under the pressure of incidental difficulties, and to afford assistance to their relatives when death comes and makes their homes desolate." With such benevolent aims and objects before it, we can but wish the Association of Foremen Engineers God speed.

THE COAL TRADE OF PITTSBURGH.

WE find, in the *America Reporter*, some interesting particulars respecting the development of the coal trade at Pittsburgh, in the State of Pennsylvania. What with coal and petroleum, the Quaker State possesses enormous mineral wealth.

The extent of the bituminous coal-field by which Pittsburgh is surrounded is 15,000 square miles, equal to 8,600,000 acres. The amount of coal contained in that area it is difficult to estimate, from want of reliable information of the number and size of the veins of coal to be found at the same depth below the surface, reached in English and French mines. The copper seam, rating it at an average of eight feet in thickness, is estimated to contain 1,497,464,000,000 bushels, or 53,516,430,000 tons of coals, which, at two dollars per ton, or a little over seven cents per bushel, would be worth 107,032,860,000 dollars.

The following furnishes an exhibit of the whole coal trade of Pittsburgh:—

Number of Collieries	100
Hands employed	6,423
Number of Cars	21,254
Value of Coal Lands (dollars)	7,519,708
Value of Houses (dollars)	1,267,000
Value of Improvements other than Houses (dollars)	1,344,300
Value of Cars, Tools, &c. (dollars)	354,604
Value of Live Stock (dollars)	208,175
Population of the Collieries	30,960
Coal mined in 1864 (bushels)	48,462,966
Of which was consumed in Pittsburgh (bush)	18,921,399
Of which was exported by Ohio River (bush)	29,541,567

In the number above given of collieries and hands employed, several small mines in the neighbourhood of the city are not included.

Things Talked About.

IT is somewhat curious to find two men of high character, generous impulses, and large experience arriving at directly opposite conclusions on a matter of fact which each has investigated, and which is directly connected with a cause of which each is a time-honoured and able champion; yet such is the case with the Earl of Shaftesbury and the Rev. Lord Sidney Godolphin Osborne—the famous "S. G. O." of the *Times*. The case of John Cross, the Dorsetshire peasant, attracted, as is well known, great attention to the condition of the Dorsetshire labourer generally, which, for years past, has been proverbially wretched. The Earl of Shaftesbury, the lord-lieutenant of the county, denies that the labourer is anything like so miserably paid, fed, and housed as is popularly believed; and asserts, as a matter within his own knowledge, and sustained by the evidence of extensive personal inquiries, that he is really in a better condition than the labourer in many other counties, and even in some of the manufacturing districts. "S. G. O." maintains the contrary. He also has been among the Dorsetshire peasantry, has seen and heard for himself, and emphatically denies the earl's assertions, which have, he says, "astounded him." We shall know something more of the subject before long. Perhaps some of the "bold peasantry, their country's pride," will be able to relate their own history.

The prosperity of a country is generally indicated by the marriage rate. According to that test, we ought to be doing well; for the quarterly return of the Registrar-General tells us that in the three months ending September, 1865, weddings were more rife than they were in the previous summer, or in the summer of any year since registration began. This implies that the great body of the people were prosperous in Yorkshire, the woollen trade of which had greatly increased, owing to the rise in the price of cotton. In London, there were a thousand more marriages than in the preceding quarter. There is another aspect in which this fact may be viewed. Not only does an increase of marriages show advanced prosperity, but also a probable increase of morality and happiness.

If the demand for some of our textile fabrics is advancing, and Yorkshire, for example, still maintains its high reputation, it is rather discouraging to hear that in other and most important branches of industry England is not holding her own. Yet, at a recent meeting of the Birmingham Chamber of Commerce, the Vice-President, Mr. J. S. Wright, did not hesitate to say—"He believed at the present moment in Birmingham, which used annually a million pounds sterling of gold and silver, and 1,000 tons of copper, giving half a million sterling, and had nearly 400,000 inhabitants dependent for support upon the superior metals, the number of persons engaged in those trades who studied chemistry with a view to making themselves better manufacturers in metals did not exceed ten, nor had it exceeded that number for the last quarter of a century. In this matter it was necessary to turn over a new leaf if they would maintain their position." We think so too. Unless they do, French and German manufacturers, who know how to ally science with art, will carry off the honours. Bir-

mingham workmen who would be something more than mere machines, should take the matter to heart, and obtain for themselves, by self-culture and research, the honours of successful labour. A consequence of the want of proper chemical knowledge was mentioned by the same speaker:—"It was true at the present time that a large sum of money was wasted annually—he set it down at £20,000—by the metals in solution which rolled down our kennels, and the acids used in the manufacture." "Waste" is every day becoming a stranger word to the scientific mind, which is learning to utilise almost every product. Birmingham manufacturers little think what they are throwing away.

Sanitary reformers may derive a valuable illustration of the cost of dirt from Marseilles. The late outbreak of cholera in that town—due, beyond all question, to the wretched condition of the town in all matters pertaining to sanitary necessities—was only subdued by the desperate expedient of lighting enormous fires in the street, with the probability of setting fire to the houses. As it is, the fires so damaged the pavement, that the repairs will cost about £2,500. A correspondent remarks, "Had that sum been expended in sanitary precautions before the cholera broke out, many persons now rotting in their coffins might have still been walking about on the uninjured pavement."

The efforts to obtain better house accommodation for working Londoners are progressing unflaggingly. There has been a meeting at the Metropolitan Club, at which the Right Hon. W. F. Cowper, M.P. (Commissioner of Works and Buildings), the Marquis of Townsend, Lord Ebury, and many other influential persons attended. A scheme was submitted, and generally approved, for the formation of a company, with a capital of £100,000, in £10 shares, for the erection of dwellings in flats, and also small houses in the suburbs. The management is to be in the hands of trustees and directors, elected by the shareholders; so that capitalists and working men would be represented, and guarantee obtained for proper financial management, at the same time that the peculiar requirements of the tenants would be considered. Some of the features of a building society, facilitating the purchase of the tenements by the occupiers, are also incorporated in the plan, which appears to deserve support. Only in some such manner, we are convinced, can the great problem of properly housing the working classes be solved.

A meeting has been held at Lambeth for the purpose of advocating the opening of the national collections and museums in the evening. The danger from fire has been hitherto the great objection; but South Kensington is open, and safe—why not the British Museum? Surely proper precautions are not beyond the reach of science? The reading-room, for instance, might be lighted from the exterior.

Mr. Alexander Kay, insurance broker, who died very recently, has, we understand, bequeathed the munificent sum of £10,000 for the purchase and maintenance of a public park for Kilmarnock, and also £6,000 to build and endow in the same town two public schools for working men, where a "good plain practical education" will be given. The deceased gentleman was born in Kilmarnock.

France is making a step towards realising a most desirable object—a universal maritime language. The "Commercial Code of Signals," just issued by the Minister of Marine, will enable English and French sailors to communicate with each other. Other countries are anxious to adopt the code; and the most valuable results may ensue.

The military store labourers are asking for an advance of wages, and Professor Fawcett, M.P., and Mr. John Locke, M.P. for Southwark, have undertaken to urge the claim on the Government.

We have before us a programme of the Islington Youths' Institute, in the Richmond Road. The members are between the ages of thirteen and nineteen, and for a subscription of 4d. a week, or 4s. for the term of four months, they enjoy the privilege of a reading-room, lending library, educational classes, lectures, and other advantages. Amusement is not forgotten, but, on the contrary, plentifully provided for. Examinations are instituted, and prizes given. The honorary secretary, in his report, shows the real wants of lads, many of them engaged in business, with little of the influences of home. He writes:—"Their peculiar wants are evening recreation, companionship, an entertaining but healthy literature, useful instruction, and a strong guiding influence to lead them onward and upward socially and morally. Their dangers are, the long evenings consequent upon early closing, the unrestraint they are allowed at home, the temptations of the streets and of their time of life, and a little money at the bottom of their pockets." The larger institutions are mostly above the means of lads; besides which, they feel *young* in the reading-room and classes. The Youths' Institute appears to meet the case almost exactly.

The Mont Cenis Railway will extend from St. Michel, in Savoy, to Susa, in Piedmont, a distance of 48 miles, and will overcome the elevation at that point of the Alps by the use of the centre-rail system, the practicability of which was first proved by trials on the Cromford and High Peak Railway two years ago. This link of 48 miles will complete the railway route from Calais to Brindisi on the Adriatic.

The Soldering Blowpipe.

Until within the last few years, the soldering lamp or blowpipe was an instrument of very rude construction. An oil lamp, with a large wick, into which the air from the lungs was blown through a bent tube, was the instrument generally met with in workshops. At the present time, ingenious and important modifications of the blowpipe are adopted; two of the most important of which we will now describe.

The *aërohydric blowpipe*, burning a mixture of atmospheric air and hydrogen gas, and giving a

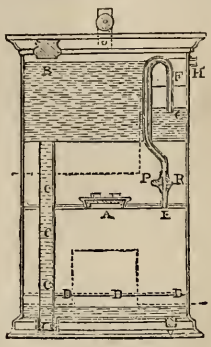

Fig. 1.

vivid and intense flame, as manageable as a pencil in the hand, is employed for soldering platinum with gold, for brazing copper and brass, and especially for the *autogenous* soldering of lead, without any alloy of tin. It is extensively employed in the latter application in manufactories of sulphuric acid and other chemical products.

The two-gallon apparatus is that generally employed. It is composed of a gas generator, a bellows, and a double cock, connecting with india-rubber tubing, and a brass burner forming a blowpipe. The generator intended to supply the hydrogen, and decomposing water by means of zinc, or iron, and sulphuric acid, is represented in Fig. 1. It is constructed on the principle of the instantaneous hydrogen lamp invented by Gay Lussac. The lower portion is filled with granulated zinc, through the aperture, A, which closes with an air-tight cover. Through the aperture, B, in the upper portion of the generator, a mixture of sulphuric acid and water is introduced. This mixture descends through the pipe, C C C, rises in the lower portion until the air introduced while putting in the zinc, and which is compressed in consequence of finding no aperture to escape by, is in equilibrium with the column of liquid. As the zinc lies on a false bottom, D D, placed at exactly the height the liquid retained by the compressed air must reach, it happens that the zinc at first remains protected from contact with the acidulated mixture. In this state the generator is said to be *charged*. When it is required to produce gas and put the apparatus in action, the cock, E (and those which correspond with it), is opened, so as to allow the compressed air to escape. While the air is escaping the liquid rises, comes into contact with the zinc, and hydrogen gas is generated. The apparatus is completely purged of air in a moment. The gas passing through E (the cock, E, being open) escapes through G into the safety-chamber, F, where it passes through a thin layer of water previously introduced through the aperture, H, by means of a small funnel. If it be desired to stop the production of gas, the cock, E, is closed; the gas which continues to be formed during a few moments, in consequence of the contact of the zinc with the acid liquid finding no escape, becomes compressed, presses upon the liquid, which rises through the pipe, C C C, into the upper portion until its level in the lower portion is below the false bottom, D D. Then there is no longer any contact between the zinc and the liquid, and, consequently, no further liberation of gas. To put the apparatus in operation, the cock, E, is opened, the compressed gas escapes, the liquid ascends, reaches the zinc, and produces gas in proportion to the quantity consumed.

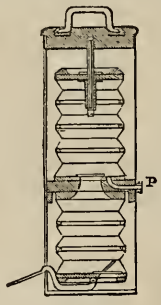

Fig. 2.

Fig. 2 represents the bellows, which, worked by a pedal, supplies the requisite atmospheric air.

When the end of an india-rubber tube, L, is attached to the aperture, H, of the generator, and the end, S, to the air-bellows at P, the apparatus (Fig. 3) is ready for working. The workman takes hold of the brass pipe, N N N, then opens the cock, E, and the corresponding cock, M. The gas which escapes through the burner, O, being lighted, gives at first a soft red flame. The workman then opens the air-cock at U, until the flame becomes vivid, taking a blue tinge, and assuming a pencil-like shape.

Fig. 3.

As may be imagined, the workman now holds in his hand, at the end of a brass tube attached to a long india-rubber tube, a real *fire-tool*. Some idea of the value of such an instrument may be obtained when it is known that under a small bulk it can always be applied on the spot, and in every possible position. In soldering two

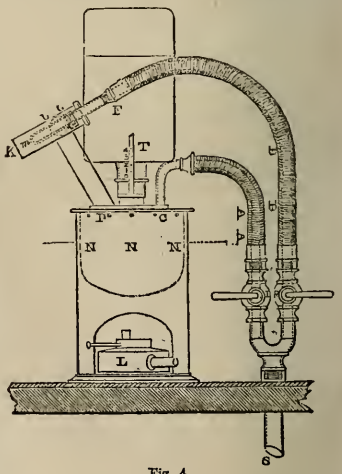

Fig. 4.

sheets of lead, the tongue of flame unites the edges into a homogeneous mass by instantaneous fusion, which may be confined to the exact spot required. The applications of this aërohydric flame to working in lead, zinc, copper, and platinum are very numerous.

Another kind of blowpipe (Fig. 4) burns the heated vapours of turpentine or petroleum. It is now substituted for the old oil blowpipe in the workshops of gold and silversmiths, jewellers, bronzists, dentists, enamellers, &c. A glass flask, kept constantly full, feeds a small copper boiler with spirits of turpentine, under which a spirit-lamp is kept burning, L. A thermometer, T, immersed in the turpentine, indicates the temperature suitable for operating. A bellows supplies air through S, into the india-rubber tubes, A A, and B B. Upon opening the first cock, E, the air enters the boiler at C, above the level of the turpentine, N N N, to pass out at D, carrying with it the vapours of the turpentine, which are lighted at K. At first the flame is soft and white. The second cock, F, brings by the tube B B, which terminates the tube or blow-pipe, J J, a current of

compressed air, which, projecting into the interior of the flame, renders it blue and vivid, giving it the form of a dart more or less expanded. It is well adapted for glass-working and soldering the precious metals.

We have no hesitation in saying, that with one or other of the blowpipes above described, all the difficulties in the art of soldering may be entirely overcome. Besides the economy, which is considerable relatively to the means formerly employed—particularly in soldering lead, and for jewellers' work—these instruments combine the best conditions known of cleanliness and health of the workman.

General Information.

CLUBS AND INSTITUTES.

Albert Working Men's Club, Knightsbridge.—A large attendance of members and friends assembled in the spacious lecture-room on the 29th ult., on the occasion of an address on "Education," by H. H. Sales, Esq., Secretary to the Metropolitan Adult Education Association. The speaker, in his opening remarks, expressed a fear that the subject would be considered dry and tedious—a fear that was not in the slightest degree realised. Having noticed the objections still offered to education, he traced the course of the student from infancy to manhood, noticing all the agencies employed. At the conclusion of his address he made a few pointed remarks regarding Working Men's Clubs. He deprecated their establishment as agencies for technical instruction, and explained their value as social regenerators. The chairman, in presenting the hearty thanks of all present to Mr. Sales, said that the attention and oft-repeated expressions of approval manifested that evening could only mean that the sooner he came again with a "dry" subject the better. Working men liked practice better than theory, and plain speaking than flattery.

Leeds Working Men's Hall Annual Soiree.—The Third Annual *Soirée* in connection with the above institute has been held in the Victoria Hall, when between 500 and 600 members and friends sat down to an excellent tea. A public meeting was afterwards held, at which there were present from 1,500 to 1,600—the principal portion of the audience consisting of the fair sex. The Mayor (H. Oxley, Esq.) presided, and among those present were Lord Milton, M.P.; Mr. E. Baines, M.P.; Rev. Canon Atlay, vicar; Rev. J. Blomefield, president of the institute; W. M. Kirkbride, hon. sec.; W. Stainton, assistant hon. sec., &c. Short speeches were the order of the evening, the proceedings being enlivened by a choice musical entertainment. Mr. W. M. Kirkbride, the honorary secretary, read the annual report, which stated that the committee were glad to acknowledge the success that had hitherto attended their efforts. The total number of tickets sold during the year had been 13,300, making the average weekly attendance upwards of 250. The committee had great pleasure in recognising the valuable services of Mr. Fred Spark, the honorary conductor of the singing class, which had been attended by an average weekly number of thirty. It was intended to form a series of educational classes, which the committee earnestly hoped the members would largely avail themselves of. The reading-room was well supplied with newspapers and periodicals, and was highly appreciated. The library had now increased to 700 volumes, and was, therefore, a valuable addition to the institute. The penny savings' bank department—a branch of the Yorkshire Penny Savings Bank—had been very successfully carried on, the average amount of deposits having been 24s. weekly. The total amount received during the last nine months had been £45 6s. 1d. The Sunday services, conducted by ministers of various denominations, had been attended by an average number of 100. In conclusion, the committee appealed to the working men of the West End to come forward and render to the institute still further support, as it was a hall which they might really call their own. Lord Milton, M.P., Mr. Baines, M.P., and other gentlemen, then addressed the meeting, which was of a most agreeable character.

Proposed Working Men's Club at Oswestry.—A meeting has been held at the Public Hall for the purpose of taking the initiatory steps in the formation of a Working Men's Club for the town and neighbourhood of Oswestry. Mr. Garbutt presided, and the principal workshops in the town were represented. Mr. J. Gibson having been appointed secretary, the following resolution was carried unanimously:—"That the objects of this society be the elevation of the working classes, morally, mentally, and physically, and the provision of better means of social intercourse." At the adjourned meeting there was a large attendance, and a lengthy conversation took place on the subject of ways and means; and it was ultimately resolved that a deputation be appointed to wait upon the committee of the Literary Institute, and ascertain upon what terms a suitable room could be obtained for the purposes of the club.

The Bridgeton Working Men's Club, Paisley.—The Bridgeton Working Men's Club and Reading Rooms, situated at the east of Canning Street, were formally opened on Thursday, 18th ult., by a *soirée* held in the large hall of the institution, which was crowded on the occasion by a most respectable company, and, with its open painted roof, its tasteful decoration of flags, and its brilliantly lighted interior, presented an interesting and animated spectacle. The chairman, W. Holmes, Esq., in the course of his address, said—"I am glad to have this opportunity of stating that, almost without exception, the mill owners and gentlemen in this district—so far as called upon—expressed their sympathy with the movement, and took shares in the building. These subscribers to the building fund, having elected six of their own number as directors, empowered them to purchase ground, and erect premises, on the understanding that, so far as occupied by the club, a maximum rent should be paid, sufficient to yield 5 per cent. interest on the cost of building, but that this might be reduced down to a minimum rent of 2½ per cent., should want of success on the part of the club render such reduction necessary. It was thought that, if it could not pay this, it should be allowed to fall to the ground, as evidently not having the support of those for whose benefit it was intended. The accommodation consists of this hall, a portion of which will be used as a general reading room, and the remainder as a room for billiards, bagatelle, American ice-boards, &c. A spacious room above will be used as a library and magazine room, and also probably for playing chess and draughts. Another room will be set apart for smokers, and a third will be used as a business room, which may be let for meetings of clubs having this institution for their centre, or otherwise, such as curling clubs, bowling clubs, benefit societies, &c. &c. The third resolution, passed at the same meeting, appointed a committee of working men, with Mr. Wright as convener, to raise a fund, to consist of 1,000 shares of 5s. each, to provide furniture, books, games, &c., and I am glad to say that, through the energy of that committee, and the appreciation on the part of the working men of Bridgeton of the benefits likely to arise from such an institution, upwards of 700 shares have been subscribed for."

Working Men's Club, Newcastle-on-Tyne.—A correspondent favours us with a description of this club, from which we extract the following passage:—"Our club is regarded as the principal in the North of England. Being the only one in this populous town (Newcastle-on-Tyne), it enjoys a patronage that not only renders it worthy of distinction, but enables it to possess attractions that tend much to the harmony of the members, and to the popularity of the institute. The premises consist of the second and third flats of a large building. On the first flat are the reading-room, smoking-room, housekeeper's room, and an excellent lecture-room. The library, class-rooms, and amusement rooms are all on the second flat. The reading-room is spacious, well lighted, clean, and satisfactorily warmed. Six polished oak tables, with chairs to match, are ranged round the room. On these tables lie the periodicals, in order and quantity as follows:—Thirteen of the weekly periodicals, among which are Cassell's papers, the illustrated papers, &c.; eleven magazines, seven provincial weekly newspapers, five London dailies, four London weeklies, and eight local and Manchester prints. Besides these (which include many of the leading papers) there are the *Builder*, *Engineer*, *Athenæum*, *Spectator*, and a few others. On the first of these tables, beside the periodicals, lie the "Members' Remark Book," containing suggestions and remarks of the clubbists. The library, being but lately begun, is not in any great stage of development. Upwards of 300 volumes on all subjects, partly purchased by the club, and partly contributed by friends, constitute all its resources; yet, three months since we had no library. About that time the committee, feeling the desirability of having one, and determining to do something more than merely to express this desire, got up a public meeting, and, placing Sir W. Armstrong in the chair, enlisted such an amount of assistance, that within six weeks afterward our library was inaugurated. Next the library apartment are the amusement rooms and class-rooms. These rooms require no remark further than to say that they are clean, comfortable, and well attended. The usual indoor sports obtain: the classes are for drawing, music (vocal and instrumental), and the drama. The lecture-room is the same size as the reading-room, is furnished with backed forms, having the one end of it fitted up with theatrical scenery, consisting of a stage, proscenium, foot-lights, wings, and four painted curtains. But what is most worthy of being known is, that all this was constructed by members during their leisure hours; joiners erected the stage and wings, a paper-hanger or two gave their assistance, and the curtains were executed by a journeyman house-painter."

INDUSTRIAL EXHIBITIONS.

On Saturday afternoon, the 3rd inst., the closing ceremony of the distribution of prizes to the exhibitors of the South-Eastern Industrial Exhibition took place in the Painted Hall of the Royal Hospital, at Greenwich. The Hon. Arthur Kinnaird, M.P., in the absence of Viscount Sydney, lord-lieutenant of the county, presided, supported by Sir Charles Bright, M.P.; Colonel Anderson, R.A.; the Rev. C. F. S. Money, the chairman of the committee; Judge Payne, and a large number of the local gentry. The Rev. C. F. S. Money, the chairman of the committee, said during the period the exhibition had been opened upwards of 85,000 persons had paid for admission. Of this number the vast mass were of the working classes, who had visited during the evenings to the number of 62,000, at a very low price of admission. 11,000 in round numbers had visited during the mornings, and 11,000 children had been admitted free. The total receipts had been £1,215, and the expenses in round figures £1,004, but there were other liabilities which, with the receipts of that day, would about be covered. The prizes were afterwards presented, and consisted of a gold medal (the receiver of which was greeted with tremendous applause), a number of silver and bronze medals, and some three certificates of merit of very beautiful design, illuminated and printed in gold. Amongst the recipients were a very large number of females, who had obtained prizes for embroidery and needlework, and who were loudly applauded on reaching the dais. Much amusement, however, was created by the introduction of one of the opposite sex, who received the principal prize as the best "needlewoman" in the exhibition. The presentation occupied such a length of time that a large proportion of the company began to leave. Ultimately Sir Charles Bright, M.P., Mr. Joseph Payne, and others offered a few observations, and after singing the "Old Hundredth Psalm," and returning a vote of thanks to the chairman, the proceedings closed with the National Anthem, in which the band and the whole of the company joined.

CO-OPERATION.

The Kilnhurst (Yorkshire) Equitable Industrial Provident Co-Operative Society.—The Twentieth Quarterly Report shows the following results:—"The cash received for goods sold this quarter is £828 15s. 4½d., and the profit realised is £67 13s. 6½d., which, after paying interest, and allowing 20 per cent. for depreciation of fixed stock, &c., we are enabled to pay a dividend of 1s. 6d. in the pound on all cheques brought in. The Society has been in existence five years, and has sold goods to the amount of £12,836 12s. 8d., and realised a profit of £841 1s. 10d., which has exceeded the expectations of the most sanguine parties connected with the society. The members' claims, as per ledger, is £771 15s. 5d., so that the society has gained more profit by £69 16s. 5d. than its present paid up capital amounts to; so that if all the members had only let their profits accumulate, every member could have withdrawn the money they have paid into the society, and then the society would have had £96 16s. 5d. more working capital than it has at the present time. We hope this will show to the members the utility of letting their profits accumulate, and not to withdraw them from the society, unless stringent necessity compels them to do so."

THE SHORT TIME AND WAGES MOVEMENTS.

The Hatters' Society (Bristol District).—The members of the above society having considered the high prices of the necessaries of life, and the advances in wages that employers in the other districts have conceded to their *employés*, resolved to submit to their employers a carefully revised advanced list of prices, which they presented on the 1st of November last, with a respectful request that it come into operation on the 1st of February, 1866, thereby giving the employers three months' notice. On the 1st inst. the deputation waited upon the employers, when they all consented to the new list in its entirety.

Power-loom Weavers' Wages.—All the weavers of Barnsley, about a month ago, asked for and obtained an advance of wages to the extent of 10 per cent., with the exception of those employed by Messrs. Taylor and Sons, the largest firm in the town, at which the advance was never asked for; but on the 2nd inst., shortly before noon, all the hands employed (about 500) struck work in a body, and, despite the remonstrances of the overlookers, every loom in the extensive shed was stopped until they had had an interview with one of the firm. Deputations were at once chosen from the damask and huckaback weavers, who had an interview with one of the above firm, who, after a lengthened discussion, promised to lay the matter before the whole of the firm. The hands then resumed work.

Farm Servants' Wages in East Lothian.—At the Haddington hiring fair a slight rise took place. In the lower districts of the county, where the wage is paid mostly in money, with an allowance of meal, there was an increase of from 30s. to £2 a year, increasing the money wage from £16 to £18. In other districts, where the extras are greater, an increase of £1 was given; and in the higher districts of the county, where the custom is to give the hinds a cow's keep, the wages remain stationary—the money wage being from £12 to £13. The effect of the changes that have taken place has been nearly to equalise the rate of wages in the county, the hinds in the lower districts having hitherto been paid at a wage somewhat lower than has been given in the upper wards.

The Iron Moulders in Manchester.—During the last few weeks the journeymen moulders of Manchester and Salford have made a demand, at a very short notice, for a general advance of wages of 2s. per week. The weekly wages given to iron-moulders in Manchester and Salford have been 34s. and upwards, which are stated

to be more than the rate obtained by any other class of operatives connected with the engineering trades in the same locality, and the present demand is for 2s. advance for every moulder employed, whether he receives 34s., 36s., or 38s. This is looked upon by the employers as an attempt to initiate a general rise of wages in all branches, as a similar advance can hardly be refused to engineers, millwrights, smiths, turners, pattern-makers, &c., after it has been granted to the moulders. Most of the foundries in Manchester have ceased casting for the present, and others are partially worked by moulders at the old rates. The masters have had several meetings, and it is intended, we are informed, that a Defence Association be formed, unless the present demand be withdrawn.

STRIKES.

Smiths' Strikers' Turn-out at Hunslet.—The men employed by Messrs. Manning, Wardle, and Co., at the Boyne Engine Works and the Steam Plough Works, Hunslet, struck work in a body about two weeks ago, in consequence of the refusal of the proprietors above named to give the men an advance of wages demanded, which was from 16s. to 21s. per week. The masters, however, offered to give the advance on a graduated scale, but this did not suit the men, and they accordingly struck work. Thirteen of the men have returned to their work; and with the aid of a steam-hammer erected by Messrs. Manning and Co., and some additional men from a distance, they are now able to dispense with the services of the ringleaders of the movement (who have since expressed a desire to return to their work), and carry on their extensive business as before, having, in the meanwhile, advanced the rate of wages of the men considerably.

Strike of Colliers at Shireoaks, North Notts.—The whole of the men at the Shireoaks Colliery (belonging to the Duke of Newcastle) are now out on strike, and the works are standing still. This is the first time anything of the sort has occurred since the commencement of the works, nearly ten years ago. The men have turned out for an advance of 1s. per score, and their statement is, they were promised an advance in prices as soon as a rise should occur in the market price of coal. They further state that an advance of 1s. 6d. per ton at the pit mouth took place a month ago, and on the 2nd inst. they made an application for the rise of 1s. per score. This not being acceded to, they turned out on the following Wednesday, and held a public meeting near the works, at which upwards of 400 miners were present. A miner named Lea was the principal speaker. A resolution was moved, and carried unanimously, to the effect that the men should not go to work again until their demand was acceded to. A second meeting was held the next day, the chairman taking up his post in the middle of a large tree, surrounded by the miners. Thirty-four delegates were sent from this meeting to confer with the manager as to their demand, and after a consultation of two hours' duration the application was refused. On the return of the delegates to the meeting, and the result of the interview having been made known, it was resolved that the men should not go near the works again till they went for their wages on the Saturday, and if their demand was not complied with they would then remove their tools.

The Cotton-Spinners of Ashton-under-Lyne.—The self-acting winders in the employ of Messrs. Reyners, cotton-spinners, Ashton-under-Lyne, have turned out in a body. They complain of the quality of the material used in the mill.

The Rochdale Piecers.—The "piecers" employed by Messrs. Schofield, Heap, Berry, and two other firms in the neighbourhood of Milnrow, Rochdale, have turned out on strike for an advance of wages.

BENEFIT SOCIETIES.

The West-End Waiters' Benevolent Association, 44, Pall Mall, London.—This association has been established as a friendly benefit society to relieve its members in time of sickness or distress, and also keeping a register of vacant situations, to supply such of its members who require it with situations. A list of its members wanting places is also kept; and as only men who have been waiters four years are admitted members (except under conditional circumstances approved by the committee), the committee can guarantee men of good character and known ability to proprietors of hotels, taverns, and restaurants. Members, by paying an entrance fee of 2s. 6d., and a weekly contribution of 6d., are assured the following benefits:—12s. per week in sickness; upon the death of a member, £12; member's wife, £6; member's child, £3. Also, any member out of a situation is entitled to a situation from the books of the society. Proprietors of hotels and other gentlemen wishing to aid the association, can become honorary members by paying 10s., or any amount they please, per annum. Waiters living in the country, who are unable to attend at the society-house, can join the association by applying to the secretary for the necessary forms. In reference to the association, a waiter writes to us—"The waiters are a very numerous body of men—a separate class of men, if I may so call them, to other labouring men; but I see no reason—despised as they are at the present time—why they should not be as respected and respectable as any other body of working men. The time has now arrived when we are determined to show what *we* can do by combination."

Correspondence.

*** *We shall be happy to receive any information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

THE LETTER CARRIERS' GRIEVANCES.

To the Editor of the Working Man.

Sir,—I wish to thank you for the well-written article on "The Letter-Carriers' Grievances," and I wish to correct one error which is likely to mislead the public. You make it appear that a letter-carrier receives 30s. per week after ten years' service; such is not the case. A letter-carrier, under the last scale of wages issued by the Postmaster-General, will have to labour in the service for upwards of sixteen years before he gets 26s. per week; and then, if he is so fortunate as to get that, he will rise, by annual increase of 1s. per week, until he reach the noble sum of 30s. per week, which I don't believe one hundred out of the whole of the letter-carriers receive. I would further explain the grievances of the letter-carriers; but they are going to have a public meeting in the city, to give a statement of their grievances, at which meeting I hope the merchants, bankers, &c., will attend, and hear for themselves the grievances which I with my fellow-servants will be there to explain. The scale of wages issued by his lordship the Postmaster-General looks well on paper, but myself, with a great number of my fellow-servants, can prove it is not a fair statement.—I am, Sir, your obedient servant,

A Letter-Carrier Thirteen Years,
February 3rd, 1866. only 25s. a Week.

WORKING MEN'S HOMES.

To the Editor of the Working Man.

Sir,—You have repeatedly given us some most interesting descriptions of how working men are housed and treated abroad; and nothing could be more striking than the difference between our homes and those of our foreign brethren. When a working man gets a job in London, the first thing is, of course, to find the best place to pitch his tent nearest his work. He will commence the dreary task of lodging-hunting by wandering up and down the most decent streets he can find, and applying where there are rooms to be let. The first question put to the working inquirer is, "Have you any children, sir?" and as most of this class have their quiver full of these little ones, the invariable reply is, "Yes, ma'am, I have." Whereupon the door is shut, and he is politely informed, "We couldn't think of taking lodgers with a family." And so he goes on, seeking and not finding, till he is driven into some locality where there are large houses, owned by greedy and often sensless money-grubbers, who let each room out to a separate family, at a very high rent. And these landlords—who form part of a series of land-sharks, that live by preying on the working man—knowing the power they possess, inasmuch as his class of tenants, having large families, cannot easily get accommodation elsewhere, will not keep the places in even decent order or repair, unless forced. At the same time, they take very great care that the rent is duly paid.

The wife sends the children to the only playground that she can—and they must play somewhere—viz., the streets, where they soon get the education that brings us so many precocious boys and bad men, that are complained of so much and so loudly. The wife soon becomes irritable and excited; and how the husband is driven to the public-house by an uncomfortable home is so generally understood that it need only be mentioned, just to say a word for the women, who generally get all the blame. How is it possible for any woman, in such circumstances, to make a happy home? Those who understand the matter must agree that, unless she is something superhuman, it is a perfect impossibility. There is one alternative to this. The working man may take a house, and make up the rent by underletting; but this has evils, as many as the former case. Drink has had the credit of being the cause of nearly every crime; I am bold enough to assert it is not so. Bad and uncomfortable homes form the seed, and drink expands them until they grow into deep-rooted and almost irremovable evils. Though there are many valuable agencies at work to improve the masses of working men, the most valuable and real way of doing them good is by giving them much better and much cheaper homes; and I think these might be had as well in England as abroad, and it is certain they would pay the promoters fully in every sense.—I am, Sir, yours respectfully, G. W. A.

SUNDAY EVENINGS FOR THE PEOPLE.

To the Editor of the Working Man.

Sir,—I should not have troubled you with a second letter on the above subject, had not two of your correspondents brought a charge against me, in your impression of the 3rd inst., which demands a reply.

In introducing the question, "Is it right that secular lectures should be delivered on Sundays?" I made use of the words that "the scheme was an affair of cash, although no money might be taken on Sunday," tickets which had previously been paid for being the means of admittance. From these words Mr. Rogers draws the inference that I have made a "vile imputation" against those gentlemen who have taken the affair in hand; and Mr. "Mac" follows suit by remarking that I am "very indiscreet, in making an accusation of catchpennyism which implicates a host of gentlemen," &c. &c. I deny that I have made a "vile imputation" on the character of any one; neither have I, in the eloquent language of Mr. "Mac," made "an accusation of catchpennyism." And I can prove what I assert. It is hardly likely that Professor Huxley and his associates are the originators of the movement. It is more than probable that they have merely come forward at the request of some society—possibly the "National Sunday League;" nay more, for aught I know, they may receive no remuneration whatever. How, then, can my remarks be considered in the light of a "vile imputation?" But suppose, for argument's sake, in the words of Mr. Rogers, "the cream of the literary and scientific world" (an assertion open to question) are the sole originators, and are solely responsible for the undertaking, even then my observations would not amount to an "accusation of catchpennyism;" for the scheme is an affair of cash, or, if you will, a commercial transaction, in this wise: a contract is entered into between the lecturers and the public, the conditions of which are that the public pay a certain amount of money to hear certain discourses. The discourses are delivered on Sundays, and therefore the lecturers are, in my opinion, *morally* wrong, whether they are or are not the originators, for fulfilling a commercial compact on the day of rest, but I do *not* accuse them of sordid motives.

Apologising for the length of this letter, but trusting to your sense of justice to insert it, I beg to remain yours respectfully, A Bookseller's Assistant.

February 6th, 1866.

[Our correspondent having had the opportunity of reply, we must decline to insert any further correspondence on the subject. The lectures are discontinued, and it is most undesirable that personalities should be indulged in. Several correspondents have addressed us on this matter; but, as it appears difficult to avoid theological discussion, we feel the necessity of declining to insert their communications.—Ed.]

TO CORRESPONDENTS.

W. M. will see that we have taken up the subject of the preservation of the open spaces around the Metropolis, and we shall recur to it whenever we have reason to think that our efforts may be of service to the good cause.

C. N. (Sheffield).—We shall not be able to afford space in our columns for the proposed essay.

Stonemason.—Apply for a detailed prospectus of the building society, which will enable you to form a better judgment of the matter than the short advertisement, which, it may be said, issues from a respectable quarter. We are unable to give any information respecting the other society.

J. P. (Stalybridge).—The secretary of a building society would be able to give you better information on such a subject than we can. The proposed plan does not appear to be very practicable.

A Plumber.—The article on the "Soldering Blowpipe," in the present number, will give you the information you require.

J. H.—Success in gilding on glass depends on the tact and skill of the operator. No instructions will supply their place. The design is drawn in gold size, and the leaf applied in as large portions at a time as practicable.

A. Middlemist.—Indigo blue from peat is obtained from the products of its dry distillation. We shall give details of the process as soon as they are published. A beautiful green dye may be obtained from picric acid and indigo, which is not at all injurious to health, like the copper and arsenic greens.

James White.—Glass globes may be silvered by pouring in an amalgam of silver, and turning the globe round and pouring out the excess of the metals: or the globes may be silvered by Drayton's process, in which a solution of nitrate of silver, mixed with organic substances, throws down metallic silver in a pure state.

A. B.—We quite agree with you in your objections. The article referred to was given only as information.

A Cabinet-maker.—We shall give full details of varnish-making in early numbers of the Working Man.

Adamson, W.—There are various methods of quickly clarifying water for manufacturing purposes, such as by the addition of alum and of hæmatite.

Woodfern, H.—Teazles may be hardened by submitting them to the action of a warm or a cold solution of blue vitriol (sulphate of copper). The teazle, without losing any of its elasticity, acquires remarkable properties. It is preserved from decay, and can be used as well in the green as in the dry state, and be employed immediately after it is gathered; besides, it performs its work with a remarkable degree of regularity, because the natural hooks of the teazle acquire by this treatment equal properties of elasticity and tenacity.

J. B. (Bristol).—We will reply to your inquiries by letter, if you send a stamped addressed envelope.

George Nixon.—There is such a person as you name—a very respectable tradesman, who will, doubtless, reply to your letter in due season.

A Chairmaker.—The designs may be copied by a pantograph, which may be obtained of dealers in artists' materials, and costs from five shillings and upwards; or you can copy on large paper, ruled in squares, corresponding to squares ruled on the pattern.

R. B. (Newport).—You can procure the tools for marquetry work at almost any tool shop. We do not know of any book on this subject. You will find some information in Cyclopædias. Information on French polishing and dyeing woods may be found in any book on varnishing, or in future numbers of the Working Man.

W. B.—The Patent Office Museum is at South Kensington. It is open daily from ten till four, free of charge.

A. Wigan.—The scarcity of milk in your neighbourhood may be met by your providing yourself with a stock of preserved milk, which is imported into this country from the United States, in sealed tins containing one pound. Loaf sugar is used in preserving this milk, which is quite pure, and of excellent quality, as we have proved.

Boss.—Sir David Brewster recently expressed himself favourable to the system of granting patents for inventions.

QUEENSLAND GOVERNMENT EMIGRATION OFFICES, 2, OLD BROAD STREET, LONDON.

Emigration to Queensland— FREE GRANTS OF LAND.—All persons not having before resided in Queensland, paying their own full passages to the Colony, receive a £30 Land Order—equal to thirty acres of land for each member of their families of twelve years and upwards, and a £15 Land Order for each child between fourteen months and twelve years. Free and Assisted Passages are now given without restriction as to age, to persons of the following occupations:—Shepherds, ploughmen, road-makers, quarrymen, professed gardeners, miners, carpenters, masons, bricklayers, blacksmiths, wheelwrights, shipwrights, &c. Also female domestic servants of good character.

HENRY JORDAN,
Agent-General for Emigration for Queensland.

Government of South Australia. EMIGRATION DEPARTMENT.

FREE PASSAGES are granted to South Australia, in vessels chartered expressly by H.M. Emigration Commissioners, to PLOUGHMEN, farm servants, miners, masons, bricklayers, wheelwrights, blacksmiths, sawyers, carpenters, gardeners, grooms, collar and harness makers, country shoemakers, &c., also to single female domestic servants.

Further particulars and forms of application may be obtained at the office of the Emigratim Agent for the Government of South Australia, 5, Copthall Court, London, E.C.

Government Emigration to NEW ZEALAND.

FREE PASSAGES to CANTERBURY, N.Z., are granted by the Provincial Government to female domestic servants, and Assisted Passages to farm workmen and certain descriptions of mechanics.

Particulars of conditions may be obtained, personally or by letter.

JOHN MARSHMAN, Emigration Agent for Canterbury, 16, Charing Cross, London, S.W.

Emigration.—Passages to all PARTS OF THE WORLD.—Every information free of charge. Best ships. Cheapest rates. Goods shipped and insured.—F. BASSIL, 139, Leadenhall Street, London.

Assisted Passages to Mel- BOURNE.—Apply to R. R. ALEXANDER, Secretary, Victoria Emigrants' Assistance Society, 27A, Bucklersbury, Mansion House, E.C.

CHEAPEST EMIGRATION TO AMERICA, £5.

New York and Portland, by steam, weekly, £5; cabin, £15 15s. Baltimore, £5 5s; cabin, £15 15s. New Orleans, £6 6s.; cabin, £25. Sailing Ships to New York, £3 3s.

R. MONTGOMERIE and CO.,
5, Ingram Court, Fenchurch Street, E.C. [20

Queensland.—Black Ball PASSENGER LINE.—New arrangements with H. M.'s Colonial Government. Reduction of steerage fare to £15. Land Orders £30, to all classes.

STAR OF ENGLAND, for BRISBANE, Moreton Bay, direct, packet for 28th February.

WANSFELL, as packet for 10th March.

Apply to JAMES BAINES and CO., Liverpool; all Agents for the Black Ball Line; and T. M. MACKAY and CO., 1, Leadenhall Street, London, E.C.

THE WORKING MAN WILL FIND

The Children's Prize. Price

1d. monthly. Published by William Macintosh, 24, Paternoster Row, London.

The Parish Magazine is

edited by J. ERSKINE CLARKE, M.A., Vicar of St. Michael's, Derby. In green wrapper, for general circulation, 1d. monthly, with first-class Illustrations. Vols. I. to VII., 2s. each, cloth; 1s. 6d. limp. Most popular in School Libraries, for Prizes, and for lending to sick folk, or in hospitals.—London: BELL AND DALDY, 186, Fleet Street.

Good Stories. Selected and

edited by J. ERSKINE CLARKE, M.A. Issued monthly. Illustrated, and in ornamental wrapper. Printed in a clear type, and in a style chosen by a class of factory scholars, as being easiest to read. Each story complete in itself. Price 3d. Each group of four (1st, 2nd, 3rd, 4th, 5th, and 6th series), bound in cloth, 1s. 6d.; or the twelve for 1864 and the twelve for 1865, richly bound in cloth gilt, 3s. each.

London: WILLIAM MACINTOSH, 24, Paternoster Row.

New Series of Parish-Library

BOOKS. Edited by J. ERSKINE CLARKE, M.A. Illustrated, printed in a clear type, and of a handy size. Price 1s. each, bound in cloth:—

1. Deb Clinton, the Smuggler's Daughter.
2. Can She Keep a Secret? (Specially for servants.)
3. Old Andrew, the Peace-maker.

This series will be added to from time to time.

London: WILLIAM MACINTOSH, 24, Paternoster Row.

Weekly, 1d. Monthly Part, 3d. Part I. is now ready.

Kind Words for Boys and

GIRLS.

Royal Insurance Company.

HEAD OFFICES:
LONDON: ROYAL INSURANCE BUILDINGS, LOMBARD STREET.
LIVERPOOL: ROYAL INSURANCE BUILDINGS, NORTH JOHN STREET.

Total Annual Revenue exceeds £600,000.

Accumulated Funds in Hand over £1,160,000.

FIRE DEPARTMENT.

The Receipt of FIRE PREMIUMS has progressed as follows:—

1856	£151,733	1860	£262,978
1858	196,148	1862	300,690

While for 1864 they amounted to £406,403.

The ROYAL INSURANCE COMPANY has invariably been distinguished for its promptitude and liberality in the settlement of claims.

LIFE DEPARTMENT.

The rapid progress and position of this Branch will be best shown by the following statement of the New Life Business effected for the years

	Net Sum Assured on New Policies after deducting Guarantees.	Net Premium.
1860	£449,241 16 2	£15,079 17 10
1861	521,101 17 0	16,627 13 0
1862	701,427 15 3	22,333 13 2
1863	752,546 18 10	24,069 12 8
1864	1,014,897 11 5	32,708 10 7

Large Life Bonuses every Five Years. Those hitherto allotted have been the largest ever continuously given by any Company.

Security for both Fire and Life Branches,

Capital, £2,000,000.

PERCY M. DOVE, Manager and Actuary.
JOHN B. JOHNSTON, Secretary in London.

*** The ROYAL INSURANCE COMPANY will give its clients every advantage to be derived from the Reduction of the Duty on Fire Insurances. [12

THE WORKSHOPS OF THE WORLD.

MATCH-MAKING MANUFACTORY

A Visit to a Lucifer Match Manufactory.

THE insignificant-looking lucifer match has become one of the indispensable adjuncts of modern civilisation. Unknown to the public thirty years ago, it has risen with unprecedented rapidity into popular favour, effectually superseding the flint, steel, and tinder-box so familiar to our forefathers, and which, like the watchman's box, the sedan-chair, and the oil-lamp, have become things of the past, never to be revived in these days of express trains, ocean steamers, and electric telegraphs. The contrast between the tiny splint and the unguinly form of its predecessor, the common brimstone match, is eminently suggestive of the difference existing between the

past and the present. Yet, common as the lucifer match is, there are few who really know anything of the manner in which it is produced. Like the pin, the lucifer match forms one of the curiosities of modern manufacturing industry. Although its manufacture only dates from 1833, yet whole forests have already been cut down to supply the immense and still increasing demand for the wood of which the matches are made, to say nothing of the many tons of chemical matter likewise required; and when we come to consider that at present the trade is, comparatively speaking, in its infancy, the probable extent of its future requirements becomes sufficiently startling.

As is frequently the case with great industries, the lucifer match manufacture has risen from extremely small beginnings to its present magnitude, every new invention for simplifying the processes or economising labour tending to give an immense impetus to production; the increased cheapness of the article invariably leading to a proportionate increase in the demand. The first lucifer matches were very defective. The splints were too large, and did not ignite easily; while, from want of experience, the chemical ingredients were badly mixed, a much larger proportion of phosphorus being employed than was necessary. They were also liable to be affected by the least humidity of the atmosphere—a defect still characteristic of the generality of foreign-made articles.

During the earlier years of the manufacture, the factory system was unknown, and the matches were made on a limited scale, in small and unhealthy workshops, where few or no sanitary precautions were taken to protect the health of the workers, who generally followed their occupation in buildings utterly destitute of the proper amount of ventilation. It was during this period that the painful and loathsome disease known as "necrosis" of the jaw, was found most prevalent amongst the workers, especially those engaged in the "dipping" process—that is, the dipping of the lucifer-ends into the liquid phosphorus. Mr. William Köhler, of Birmingham, stated, in his evidence to Mr. White, that there was a great dislike in Germany generally amongst the work-people to working in a match manufactory, and that in many parts it is usual to employ prisoners for the work. In this country there is no difficulty in procuring the requisite amount of child or adult labour, no matter how poorly paid or dangerous may be the various processes.

Of late years, however, the factory system has been largely introduced into the trade, and bids fair to rapidly supersede the smaller establishments in which few workers only are employed. Amongst the larger of the London firms are those of Messrs. Bell and Black, Bryant and May, Hynam, Letchford and Co., and Bell and Co. The various establishments belonging to these firms are conducted on a most extensive scale, and in a thoroughly scientific manner. Very different are the majority of small manufactories, which are generally so conducted as to be both a danger and a nuisance to the surrounding neighbourhood. Mr. White's report is full of descriptive details of visits paid to such places, of which poverty, dirt, and squalor may be said to form the general characteristics. One of these small establishments was situated in a street, respecting which we are told that clothes, or rags, were hanging to dry in all directions, while hand-trucks, filled with remains of most offensive fish, &c., made locomotion a difficult matter. The matches were made in the living-rooms of the house by the family. "A long tear between the body and skirt of the frock worn by the little bare-legged girl," says Mr. White, "showed plainly that this was her only covering of any kind; and her mother was equally ill-clothed."

The moral and social condition of this class of workers is lamentable. They seem to be the lowest of the low, their existence being too often little more than a constant battle with cold and starvation. The introduction of the factory system and mechanical appliances into the manufacture has led to marked results, the health, morals, and remuneration of the workers being in every way improved thereby. Such is the case at the Lucifer Match Manufactory of Messrs. R. Letchford and Co., Bethnal Green. Passing through the closely populated neighbourhood of the Cambridge Heath Road, in the direction of Old Ford, we find ourselves in Three Colt Lane, once a pleasant country thoroughfare, with real green hedges and shady trees, but now lined with rows of habitations; the formation of Victoria Park having given an unprecedented impetus to building operations in this remote portion of the metropolis. In the lane alluded to is the establishment—Messrs. R. Letchford and Co.'s—which it is our purpose to describe. The factory stands in the midst of a clear, open space, forming part of the same premises, and consisting in part of grass and garden, the whole covering an extent of more than 1½ acres. This is in compliance with the provisions of the Metropolitan Building Act, which insists that buildings in which dangerous manufactures are carried on shall be situate at least fifty feet from any other building, and not less than forty feet from a roadway. This rule, intended to lessen the mischief arising from explosion or fire, has proved, indirectly, a means of promoting the health of the workers, by affording them a larger supply of pure air than they would otherwise have obtained.

The premises are divided into two clumps of buildings, in the central one of which the manufacture is principally carried on, the other being devoted principally to the preparing of the wood for the match-boxes, and the manufacture of ink and blacking. The wood used in making the matches consists of the best Canadian pine, a kind of timber which generally possesses an extremely fine grain. The wood is not cut on the premises, but is procured direct from the saw-mills, where, by means of steam machinery, it is cut, first into lengths, then into blocks, and subsequently into splints, with beautiful precision. These splints, which are twice the length of the ordinary lucifer match, are made into bundles, each containing from 2,000 to 2,500 splints.

The first process to which the splints are subjected is the *scorching*. This is effected by placing the bundles upon a heated plate, by which means both ends are speedily heated, or charred, to a degree which greatly facilitates the process of *dipping*—the heated wood more readily absorbing the melted brimstone or paraffine than would be the case had the wood been of the ordinary temperature. From the tropical-like warmth of the scorching-room, the splints are passed (still in bundles) through a window into a room in which are several pans filled with paraffine, kept in a melted state by means of steam. After both ends of the bundles have been saturated with paraffine, or, if needs be, with brimstone, the splints are taken to the saw-mill, where they are cut into two lengths. When brimstone has been used, the bundles are rolled about by boys, previously to being cut, for the purpose of preventing the splints from clinging to each other. The splints are next carried to one of the *framing*-rooms. There are two of these, each seventy feet long by thirty-five feet wide, proportionate height, and well ventilated. In these rooms the utmost activity prevails, upwards of 300 children being employed in placing the prepared matches in frames, previous to the combustible mixture being attached to the ends. In each room there are twenty-four tables, each having a stand for twelve persons.

The table is similar to a large school desk, but more upright. An iron frame is placed in a standing position, and from a quantity of matches lying on the flat part of it the framer takes and places a run at the bottom upon a small piece of board with notches in to receive fifty, at equal distances apart, then piles one board upon another, each run having the fifty notches placed in the grooves, and in a few minutes the task is completed. The whole is then screwed tightly together, forming a compact mass. Each child takes her full frame, and according to her number—each person being known in the building by one—a mark is made upon a slate by a person at the end of the room, when at the end of the day the number of frames each has filled is counted, and paid for her portion at the end of the week. It is curious to the visitor to hear the constant reports of lucifers being trodden upon, but the floor being either of stone or iron, all danger of fire is done away with.

The room in which the composition is mixed and prepared is called the *kitchen*, and a very important place it is. Great care is required, and the process is performed by two steady and skilful men. The ingredients are given to one of the men, who first mixes it in a pan dry, similar to a cook making paste, and when worked with the hands sufficiently, is laid upon a stone or iron slab. Water is then added to it, and a stiff paste made. It is then placed in pans, and a certain quantity of glue added, to make it adhesive to the matches. Steam is used for all the heating processes.

The next process is the *dipping*, or covering the ends of the splints with the explosive material. A panful of the mixture is taken from the kitchen, and put into a receptacle of hot water, which is kept at a certain heat during the time required. The dipper takes the frames, which are brought by the girls from the framing-room, and (after the mixture is placed upon the iron slab, and regulated by a gauge to about the thickness of one-eighth of an inch) dips them into the thin paste, the whole of which is charged with the explosive ingredients.

After the matches have been dipped, they are taken by boys to the *drying-rooms*. These are three in number, one to each dipper, and they are built with every care for the prevention of accident. The floor is thickly spread with sawdust, which causes the loose matches to sink under the feet, and thereby escape friction. The rooms are of arched brick, having double iron doors, and should a fire occur, these doors could be closed, and the ventilators or air-traps at top let down by the dipper, and the rooms hermetically sealed; the fire is then smothered. For every frame taken into the dipping-room, one of a two days' drying is taken out to the *packers*; and from there being fifty splints in a row, boxes containing 100 or 200 are easily filled, very little calculation being required. Nevertheless, it is surprising to see how dexterously the filling is done, as is also the framing; many of the children not being more than nine or ten years of age, and their little fingers acting like clock-work.

The *box-making* is the last round in the ladder, and forms a very good concluding part of the process of making a simple box of lucifers. The wood of the boxes is made of the best spruce-fir, pieces of a sufficient length being placed upon a movable plane, which travels backwards and forwards upon a railroad. When the plane is cutting the wood, it is pulled by means of steam power along the under surface of the block, it being securely held in its place at either end by screws and blocks. The slices are cut with amazing rapidity, and it requires two of these powerful machines to keep supplied the boys who prepare them for the boxes.

The boys take the slips or slices, and, in quick succession, place them upon a block which is gauged with thin pieces of metal. They then bring down upon the slice of wood, with some degree of strength, a block indented with a corresponding gauge, which marks the grain of the piece of wood, so as to double it up into the shape of the box, and cut it off at the same time. One boy can cut or prepare twenty gross an hour.

Other articles, such as vestas, vesuvians, ink, blacking, &c., are made in the establishment of Messrs. R. Letchford and Co., but the processes employed in the manufacture of these do not at present call for particular remark. Some notion may be formed of the enormous quantity of vestas and matches made by Messrs. Letchford and Co., by the assertion that the wax taper used for the vestas measures some 600 miles per week, or sufficient, in the course of the year, to go round the circumference of the globe, and leave more than ample length to stretch from England to America, and back again. About 24,000,000 vestas are made per week, besides some 60,000,000 paraffine matches.

A Magnesium Lamp.—The Magnesium Metal Light Company, which has works in Springfield Lane, Salford, has received from America a lamp which is stated to be the best means yet devised for burning the magnesium ribbon. This lamp contains an apparatus of wheel-work for unfolding the metallic ribbon, two strips of which are forced downwards through a tube, at the mouth of which the combustion takes place. Over this tube, and just below it, work two metallic tongues, which clear away and clip off the oxide, which has hitherto been the chief obstacle to the use of the magnesium light for any continued period. This apparatus is not altogether perfect, as owing to the oscillation of the means for effecting a clearance of the oxide, the light emitted becomes somewhat variable, although the gradations are rapid; yet it probably contains the germ of what will ultimately prove to be a solution of an hitherto difficult problem. Beneath the burning wire is a cup opening into a chamber into which the oxide (which is pure magnesia) falls, and above the body of the lamp is a small chimney with a condenser formed like a series of sieves; the vapour, as it rises, settles upon the slips of perforated metal, and is found to result in a deposit of magnesia in very minute particles.

How to Start a Co-operative Store.

There is a great advantage in establishing a fixed Co-operative Store in any neighbourhood. When it has grown to such dimensions as to include the custom of the poorer families around it, it has a distinctive moral effect. Besides increasing their means, it improves their habits—teaches providence, and the art of association.

We find, from further correspondence received, that a desire exists in many parts of the metropolis for detailed information how to proceed in the formation of a new store. A Spitalfields Co-operative Club is in contemplation. A number of Bermondsey tanners have in view to form a Co-operative Society.

The first thing to do, is for the two or three men who are the promoters of the undertaking to call a meeting of all the persons they know likely to care for the object in view, and able to promote it. In this world two or three persons always do everything. Certainly, a few persons are at the bottom of every improvement, initiating it, urging it on, and making it go. The callers of the meeting should be men who have clear notions of what they want to do, and how it is to be done, and why it should be attempted.

The first thing the meeting has to do is to arrange for subscribing capital. This is usually done by each person intending to join the store putting down his or her name for twopence, threepence, or sixpence a week—or more, as each may be able—towards the payment of shares of one pound. If the store is to be a small one, a hundred members subscribing a one pound share each, might enable a beginning to be made. In most stores, each member is called upon to hold two shares. In Rochdale, each holds five one pound shares. It is best and safest for the proposed members to subscribe their own capital. Borrowed money is a dangerous thing to deal with. Interest has to be paid upon it often before any profits are made. Sometimes the lenders become alarmed, and call it in suddenly, which commonly breaks up the store; or the directors have to become guarantees for its repayment, and then the control of the store necessarily falls into a few hands. Disputes arise about management; those who have become largely responsible fail to receive the support of the members, when they most need it and most deserve it; and the scheme languishes, or has financial convulsions, followed by fever of feeling and fatal prostration. By commencing upon the system of the intending co-operators subscribing their own capital, a larger number of members are obtained, and all have an equal and personal interest in the Store, and give it their custom, that their money may not be lost. This plan secures not only a common interest, but a large and permanent custom. On this plan, it may take longer to collect the capital, but the capital lasts longer when it is collected, and is much more productive.

A secretary should be appointed at the first meeting, and a treasurer; and two or three nimble-footed, good-tempered, earnest, willing fellows should be named as collectors, who shall go round to the members, and bring into the treasury their subscriptions. Some place should be chosen where members can pay their subscriptions—many will have the right feeling, good sense, and punctuality to go, or send, and pay their money unasked. But these are always very few. Many will think they do quite enough to subscribe, without being at trouble to do it. Others who have the right feeling, and know what they ought to do, have no methodical habits, and no sense of punctuality, and must be looked well after, or they will be sure to be in arrears. In building and all kinds of friendly societies, every workman well knows that an elaborate, costly, and vexatious system of fines has to be resorted to, to compel members to do what they engage to do, and what it is their interest to do. Considering, as Dr. Watts says, that "the mind is the standard of the man," it is astonishing how few people "know their own minds," and how many have to be fined to bring it to their recollection that they have "minds." Numbers of well-meaning working men have no control over their wages. They can only pay at a certain hour in each week, and if they do not do it then, or the collector does not catch them then, they cannot pay that week at all, for the simple reason that all their money is gone. The collectors of the store funds require to be men of practical good sense, and well acquainted with working-class nature. They must be capable of no end of trouble, and have infinite patience. "Why should any men take all this trouble on behalf of others who ought to do their duty?" is a question that the collectors will be sure to ask themselves many times. "Why should one part of the society have thus to wait upon and dance attendance upon the others, whose interest is the same as that of the peregrinating collectors?" We must leave the answer to the good nature and good conscience of these voluntary workers. We only state the facts of what will have to be done—what always has to be done; and to give our ungrudging meed of praise to whoever undertakes this work. They are the real founders of the store; they cause the fund to exist which creates it; they teach the first lessons of providence to hundreds of families who else would never learn them.

The advantage of getting the capital paid up is very great, not merely as a means of buying in the best markets, but in its influence on the minds of the members. The most merciless critics and poorest supporters of a store are always those who are in arrears. They are the first to find fault and the first to leave the store to take care of itself, if any difficulty arises.

When a hundred members have subscribed a hundred one pound shares, a small store may be ventured upon. It will be safer if the hundred members have paid up five shares each, for a capital of £500 is not too much for the commencement of a good store in London. If, however, only £100 is subscribed, the rule followed should be to retain all profits made by members dealing at the store until each has paid up five shares, which will give the store £500 to work with before paying out profits.

The Rochdale rules would be useful to follow as a model, and every store would be instructed by seeing them. A note and a dozen stamps sent to Mr. William Cooper, Oldham Road, Rochdale, will have attention, and rules of the Rochdale Society will be returned. It is the great merit of the Rochdale Pioneers, that they willingly give information to all inquirers. In another paper we will treat of the kind of place that ought to be selected for a store, and the kind of persons who ought to be sought for members, the nature of the first expenses to be incurred, and other details of the commencement of a store. The Co-operative Societies all take out licences, as they sell to the general public as well as to members. The Spitalfields Co-operators wish to know whether, as a club, they require licences. It is better to be safe, and take out licences, even if, as a club, they were technically exempted. But the first thing to do is to collect sufficient capital to found a store that shall be able to maintain an ample stock of pure provisions, and pay ready money for everything, and keep a decent balance in hand. Professor Phillips advised the members of the British Association for the Advancement of Science to be "sure of their facts" before they reasoned from them; and we would say to all intending Co-operators, be sure of your capital before you commence a store.

Labour and Machinery in Paris.—Recent returns give us the following particulars respecting the labouring population and the steam power employed in Paris during the year recently completed. The industrial population is made up as follows:—Manufacturers, 101,171; workmen and workwomen, 416,811. But of the former class more than 62,000 are little masters, either working alone or with one assistant, and belong, in fact, to all intents and purposes, to the second class, and there are still to be added 26,242 foreman-cutters and others who are really working men. Moreover, the State employs in the public tobacco, porcelain, and tapestry manufactories and other establishments 45,028 workmen, making in all a total of nearly 40,000 employers and 550,280 workpeople, of whom 105,410 are women and 25,540 children. These figures include only actual working hands, and not the members of the families dependent on their labours. As regards steam power, there are 13,691 engines employed in industrial operations in France, locomotives not being included. Of the former, 1,800 are within the limits of the metropolis, and their aggregate power is about 10,000-horse power, or equal, according to the French mode of computation, to 70,000 working hands. The value of the ground occupied by industrial buildings, not counting, of course, the lodgings of the working classes, is estimated at about four and a quarter millions sterling, and the total trade at about a hundred and twenty millions per annum.

THE DAY IS COMING, NEVER FEAR.

(*Selected.*)

Student! bending o'er the page
Writ by seer in long past time—
Reading how, in future age,
Earth shall emulate her prime:
Sigh not thou, nor deem it vain—
Error's power is on the wane;
And the day is coming—
Yea, it's coming, never fear.

Thinker! planning in thy brain
Kingdoms from injustice free,
States where Truth supreme shall reign,
Realms of Right and Equity:
Deem not thou thy thinking vain—
Folly's power is on the wane;
And the day is coming—
Yea, it's coming, never fear.

Singer! singing from the heart
Songs of love and brotherhood;
Seeking ever to impart
Aspirations for the Good:
Heed not those who call it vain—
Like the night, earth's discords wane;
And the day is coming—
Yea, it's coming, never fear.

Teacher! speaking words of might—
Fraught with counsel, full of cheer—
Sounding 'mid the gloom of night,
Like a trumpet, shrill and clear:
Think not thou thy teaching vain—
Ignorance is on the wane;
And the day is coming—
Yea, it's coming, never fear.

Worker! toiling, hour by hour,
With true hand and earnest face,
Working deeds of skill, or power,
Courage, usefulness, or grace:
Faint not, nor thy work disdain—
True hearts cannot work in vain;
And the day is coming—
Yea, it's coming, never fear.

See! on the horizon's bounds
Stand bright heralds of the day;
Hark! o'er earth strange Memnon sounds
Answer to the glancing ray;
While the evil things of night
Spread their pinions for the flight—
For the day is coming—
Yea, it's coming, never fear.—W. F. M.

BRILLIANT GILDING ON CHINA WITHOUT BURNISHING.

To gild china without burnishing, but yet brilliant, heat gently a mixture of 32 drachms of gold, 128 drachms of nitric acid, and the same weight of commercial hydrochloric acid; after the gold is dissolved, add 1·2 drachms of tin and 1·2 drachms of butter of antimony (chloride); when all are dissolved add 500 drachms of water. This solution of gold in diluted *aqua regia* is decomposed by a special balsam, formed by dissolving at a gentle heat 16 drachms of sulphur, 16 drachms of Venice turpentine, and 80 drachms of spirits of turpentine, until the solution becomes viscous and of a deep brown colour. When the solution is complete add 50 drachms of oil of lavender, and it should not deposit sulphur upon cooling. The gold solution is poured upon this balsam; the mixture is heated gently and slowly stirred, to bring the two liquids, which react upon each other, into contact. The chloride of gold becomes colourless, and if the operation has been well conducted, the gold is entirely dissolved in the oily liquid, which becomes heavy and resinous upon cooling. The water that floats above is poured off; it removes the acids. The mass is washed in warm water, and when the last traces of moisture are removed, add 65 drachms of oil of lavender and 100 drachms of turpentine. This is heated until completely dissolved, then 5 drachms of subnitrate of bismuth are added. Lastly, the clear portion, which is completely free of reduced gold, and every other insoluble substance, is decanted. This clear portion is brought, by suitable concentration, to a state fit for use. The product charged with gold then appears under the form of viscid liquid, which reflects a light green tint; the gold is in a solid state. The Venice turpentine imparts to the liquid the siccative property which it must possess for the ornaments to dry quickly. The auriferous resins abandoned by the removal of the essential oils decomposed by heat, yield at a low temperature a deposit of carbon loaded with gold, which retains the appearance of gold leaf of excessive thinness. The beauty of the gilding results, among other things, from the absence of all fusion in the resinous matters.

Five Great Taxpayers.—There are two articles that produce each above £5,000,000 a year—the one is sugar, the other tea, including coffee, chicory, &c. Tobacco and malt produce above £6,000,000 a year each; and the duty upon ardent spirits produces more than both of the last.

*Coin, from the Crucible to the Press.**

When the gold becomes solidified in the moulds, the set screws which bind the latter together are relaxed, and they fall apart, leaving the bars perfectly free. The bars are then removed, one by one, and deposited by the aid of a pair of tongs in a cold water bath. Thence they are carried to an iron-faced bench and trimmed, so as to free them from any projections resulting from the obtrusion of molten metal between the joints of the moulds. It is almost needless to say that the chips, or trimmings, are carefully preserved, and will finally be thrown again into the crucibles. In fact, no particle of the material is allowed to escape, for the very dust on the floor is collected and burnt, for the purpose of extracting the glittering specks with which it is variegated. Finally, the crucibles themselves will be pulverised, and every atom of gold absorbed by them will be regained. The bars are now of a rectangular form, their dimensions being as follows:—

	Length.	Breadth.	Thickness.
Sovereigns bars	24 in.	$1\frac{3}{8}$ in.	1 in.
Half sovereign bars .	24 „	$1\frac{1}{8}$ „	1 „

Next, they are stamped with numbers indicating the crucibles from which they were poured, and with letters representing the day on which each melting took place. A small portion is cut from each bar, to be again passed forward in marked papers to the assayer's office. That official once more tests the quality, and reports upon it. If found of the proper standard, the whole batch is carefully weighed, and delivered over to the chief coiner, or his representative, for subsequent manipulation in the coining department. The accompanying illustration will give a yet clearer idea of gold melting.

Before leaving the melting-house, it may be well to look into the apartment in which silver bars are produced. Here a similar plan is followed to that already described; but the arrangements are on a more extensive scale. The silver ingot, as it reaches the Mint from the bullion dealer's, is of gigantic size as compared with the ingot of gold. Its length is thirteen inches, its width five inches, and its depth or thickness four inches. Its weight is 1,000 oz., and its value £250. They are deposited in companies of three in wrought-iron pots, which rest in furnaces of greatly larger size than those already referred to. The pots are of circular form, and furnished with lips or spouts, to facilitate the pouring of the metal. The alloy introduced is copper, in the proportion of 18 parts to 222 of fine silver, which mixture constitutes standard silver. The preliminary and subsequent assays are taken with even a greater amount of care than that observed in the case of gold.

A swing-crane and a pair of strong nippers are used for lifting the pots from their fiery beds when the metal is sufficiently fluid for pouring, and each one is placed gently in an iron "cradle," easily tilted by means of an ingenious mechanical arrangement. The moulds, fitted together in halves, and braced firmly up in sets on travelling carriages, are advanced below the cradle. This is then inclined, and a rich and cream-like stream falls into mould No. 1, the pourer noting by the sound—as a bottler of old port does—when his vessel is sufficiently full. A workman pushes the mould-frame forward, and No. 2 takes in its quota from the lip of the pot; so with No. 3 and No. 4, &c., until the pot is empty, and many moulds are full. More ingots and alloy are charged into the pot, it is lifted per crane, swung round, and again seated in the furnace, another being drawn up, with its cargo of molten metal, to pass through the same ordeal of conversion into bars; and thus the work goes on from morning till night, the yield of a day's operations frequently reaching two tons' weight. Of course, the bars vary in size, in accordance with the particular denomination of coin to be produced from them; but they are all rectangular in form, and their exact dimensions and weight are as shown in the accompanying table:—

GOLD MELTING.

Denomination.	Length.	Breadth.	Thickness.	Weight.
Florin bars . .	21 in.	2·12 in.	1·00 in.	220 oz.
Shilling bars .	21 „	1·43 „	1·00 „	150 „
Sixpence bars .	21 „	1·12 „	1·00 „	120 „
Threepence bars	21 „	0·87 „	1·00 „	96 „

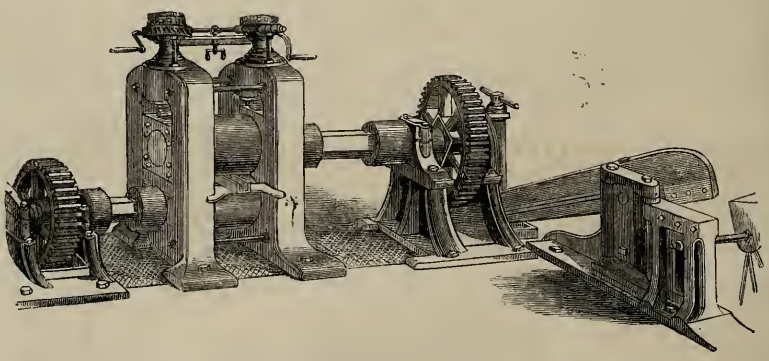
These denominations of silver coin have for some years past comprised the whole of the British series for general circulation. The crown, half-crown, and fourpence are now unknown in the Mint, except when worn specimens reach it from the Bank for transformation into the more favoured pieces named above. They are, therefore, dying a natural death from old age and hard work.

Metal for bronze money—pence, halfpence, and farthings—the composition of which consists of 95 parts copper, 4 parts tin, and 1 part zinc, is cast in crucibles, and run into moulds, precisely as if it were gold. The resulting bars are, however, broader and thinner than gold bars; and being much harder than either gold or silver, they give more trouble at every stage of their progress. They are respectively of the following size and weight:—

Denomination.	Length.	Breadth.	Thickness.	Weight.
Pence . . .	24 in.	2·50 in.	0·37 in.	100 oz.
Halfpence . .	24 „	3·00 „	0·37 „	117 „
Farthing . .	24 „	3·00 „	0·37 „	117 „

The bars resulting from each day's melting having been duly assayed, are weighed exactly, and their weights are noted down in the journals of the department. They are then returned to the central office, passed through the scales once more, and delivered into the charge of an officer of the coining-rooms. Soon they find their way by truck and tram to the great rolling-room, which is an apartment of noble proportions, and remarkable as being surmounted by the first *iron* roof of any magnitude erected in the metropolis. It contains six sets of mills, each comprising a pair of rolls, the largest of which are 14 inches in diameter and 24 inches in length, and the smallest 10 inches in diameter and 12 inches in length. They are all set in motion by means of massive shafts and gearing running in stone trenches, and driven by a 40-horse power steam-engine. There are also two pairs of revolving steel discs working edge to edge, and which cut metal into strips of any width with as much ease and with more precision than a draper cuts calico or cambric. A pair of vibrating shears of great strength constantly opens and shuts ponderous jaws, and snips off the ends of gold and silver bars with wondrous readiness. Four annealing furnaces, with numerous trucks and appliances of various kinds, mechanical and otherwise, make up the fitments of the apartment. While we have been examining these, the officer in charge has been again weighing his batches of bars, and this time for the purpose of checking any tendency to dishonesty which might exist on the part of the workpeople in dealing with a material so valuable, and which will presently have to pass through several transmutations. By ascertaining precisely—to the $\frac{1}{100}$th part of an ounce, in fact—the amount of metal distributed for working, the officer will, of course, know what amount should be returned to him at the close of a day's proceedings, when he has to strike a balance, and deposit the whole of the gold, in whatever form, in a doubly-locked and fire-proof stronghold.

It has been said that there are six pairs of rolls in the great rolling-room. The surfaces of these are as hard as steel and as bright as mirrors, and they revolve in bearings of brass resting in huge cast-iron frames. The most powerful of the "mills," as they are termed, is that to which the rough bars are first introduced, and wherein they undergo their first transformation. In order to make the action of these laminators more clearly understood, it may be well here to resort to the pencil of the artist, and to introduce an illustration. It represents the breaking-down mill and vibrating shears. The rolls are shown as supported between their side frames, and surmounted by adjusting-screws and crank-handles for moving the latter. The lower roll revolves in bearings fixed on the beds of the frames, whilst the upper is movable upwards or downwards at the will of attendants, and by means of the screws and handles. It will thus be perceived that the distance at which the rolls are placed from each can be regulated to a very great degree of nicety. In fact, *indices* placed at the top of the adjusting-screws demonstrate their precise distance at any moment. The bars, it will be remembered, are, when they leave the moulds, one inch in thickness. The problem is to reduce them, by gradually-administered pressure, to a thinness of about $\frac{2}{10}$ths of an inch. As the rolls are driven in opposite directions, they have an acquisitive tendency, and a desire, as it were, to pinch and laminate everything offered them for that purpose.



BREAKING-DOWN MILL AND VIBRATING SHEARS.

Thus, then, all is prepared for the first rolling. One workman is stationed in front of the breaking-down mill to supply it with golden food, and another behind it to catch that food as it is ejected. The bars (or a detachment of them) are placed on a truck close at hand. One by one the bars are now "offered" to the rolls, which have no hesitation in accepting them. They pass rapidly between the bright surfaces, receive a pre-

* Continued from page 102.

liminary squeezing, and are extended in length at the expense of their thickness. When some fifty or sixty bars have undergone this ordeal, the rolls are made to approach each other more closely, and the whole batch is again singly passed between them. The bars are now sensibly elongated, whilst another effect of the severe pressure has been to heat them—they having been originally stone cold—and the workmen don thick leather gloves, so as to handle them without inconvenience. Again, the rolls are adjusted, the space between them being made less, and the bars are passed between them once more. Indeed, these operations are repeated, until what were originally bars are now strips or "fillets" of gold 8 feet in length, $1\frac{3}{4}$ inches in width, and $\frac{1}{8}$ inch thick, and, of course, they are rather unwieldy in their proportions. They have also become intensely hard by force of the series of compressions to which they have been exposed. Both these evils have to be remedied before another step in the process of coining can be taken. The first is cured by aid of the shears, as seen in the engraving, and the whole of the strips are speedily cut by them into short lengths of eighteen inches each. Like some criminals, however, the dwarfed bars are still hardened and obdurate, and they must be annealed before further impressions can be made upon them. In order to effect this, they are placed in copper cells or tubes, upon the ends of which covers are afterwards placed, the joints being made tight by lutings of fire-clay. Five such cells fully charged with the reduced bars are placed upon a small iron carriage on miniature wheels, and which may readily be backed into an oven or furnace, on the reverberatory principle. In front of the oven, and balanced by a counterpoise weight, which admits of its easy motion up or down, is the oven door of iron.

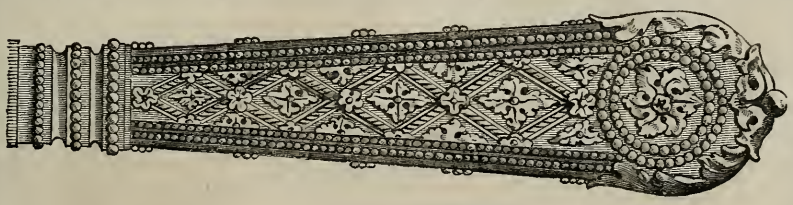
HANDLE OF KNIFE.

Art Designs

FOR USE IN TRADES AND MANUFACTURES.

CARVED KNIFE-HANDLES.

These are elegant specimens of art as applied to minor objects. The design intended for the handle of a paper-knife will show the manner in which ornament might be effectually employed in the manufacture of handles, either in wood, ivory, or metal, for paper-knives. It will be seen that there are no sharp projecting points, which might injure the hand or be broken off, and that the whole of the carving is done in low relief, which prevents the strength of the handle from becoming weakened, and admits of the interstices being thoroughly cleansed—this latter being an important consideration. The style of ornament, too, is modest and unobtrusive. The handle of the dessert or dinner-knife is of a bolder pattern, less elaborate, and to some extent less effective, than the other design, yet equally suggestive and tasteful. Both are creditable examples of the present condition of this branch of art industry.



HANDLE OF PAPER-KNIFE.

*Working Men's Clubs.**

BY THE REV. H. SOLLY.

In mentioning the clubs which have been distinguished by their hitherto successful career, I inadvertently omitted those at Edinburgh and Glasgow, which, I believe, have been uniformly and eminently, so far, useful and flourishing. The movement in Scotland dates from the meeting of the Social Science Association at Edinburgh in October, 1863, and is extending through that country with remarkable rapidity and success. I hope to have some interesting statistics before very long to present from our northern cousins.

Passing now from the topics treated of in my last paper relating to the causes of *success* and *failure* in these societies, we come to one of vital importance. Next in order to the need for a genial welcome, and for providing attractions to the Club, as set forth in that paper, comes the necessity for cherishing and developing the "society" spirit—the need of brotherhood, in fact—that spirit which has been at the heart of all true civilisation and of all successful *corporate* action from the Dark Ages when men had to form leagues for mutual protection by the sword, down to the age of Friendly, Trade, Temperance, and Co-operative Societies. But to get this spirit of cohesion and of mutual helpfulness in a Working Men's Club and Institute, on what are we to rely? Persons who have seen the power with which it has been manifest in Religious, Political, Trade, and Temperance organisations, say we never can awaken it in these Clubs, because there is no common bond of interest and sympathy, no motive power strong enough to arouse enthusiasm and zeal. Well, if there is not—if they are merely places where the members may go for a little individual or selfish amusement and rest—I grant they never can become real societies. But then I must equally grant that, in a great majority of cases, they are destined to have but a brief existence. Twenty years hence, in a few large towns, they may exist on the same footing as the gentlemen's West End Clubs, but they will not take root *now* on that footing among the great body of the working classes, nor probably at any future time. Can we find no true and natural living bond of union for them—some principle and object that shall be capable of cherishing and unfolding that divine spirit of fellowship and sympathy which is mightier to bind men together than all their selfishness and discords are to rend them asunder?—something that shall make them *societies* to which men may belong, and not merely *places* to which they may go? It would be weak and shameful to doubt it.

That uniting and inspiring principle will be found, I believe,† by reflecting on the various social, mental, and moral privations under which the working classes at present labour, and on the means offered by these Clubs for supplying those wants. I can best explain what I mean by quoting from a paper read at the Social Science Meeting held in York, 1864. I had been speaking in it of the impulse given by the Rev. F. D. Maurice and his noble coadjutors, to the movement for educating and helping working men by the establishment, in 1854, of that admirable institution, the Working Men's College, whereof so interesting an account has been given by Mr. Rossiter in this journal.

"The specialty of Mr. Maurice's labours in this direction—that which makes them mark an era in the history of the working classes, and exert so deep and wide-spread an influence—is the development and application of the grand old idea of a brotherhood for the completest culture possible of its members as human beings—*for their whole development as men.* He and his friends came to the working classes, suffering as they do from their imperfect early education, and from their contracted and often deadening daily toil—came to persons, in fact, who are often reduced nearly to the condition of machines—and said, 'We want to help you, and want you to help one another, to be men; to attain to that humanising culture and happiness, and to that noble, manly development of mind, and body, and spirit, for which you were created. For this purpose, we must have a true fellowship, mutual social sympathies, regular and earnest educational effort, a Bible-class, gymnasium, library, coffee-room, occasional lectures, *soirées*, and so forth. Will you work with us?' It will be sufficiently evident, I think, how this London Working Men's College, therefore, differed from all Mechanics' Institutions, People's Colleges, Mutual Improvement Societies, &c., that had preceded it. Its influence, which has already been felt through various ranks and in several localities, is evidently destined to increase, like most great vital forces, with the lapse of time."

But all this applies to a Working Men's Club as much as to a College—*i.e.*, if the Club is to *live*. For if it lives, it must have a principle of life, and that will assuredly make it develop and grow into such a society as above described. A true Working Men's College is simply a Working Men's Club in an advanced stage of existence. In the said paper I went on to urge that just as the *fellowship* or brotherhood of a College, on the one hand, and the *completeness* of its aim on the other, constituted its vital force, so these must be the vital element of power in Clubs also. Unquestionably we may "have Reading-rooms, Night Schools, Lectures, Mechanics' Institutes, Mutual Improvement Societies, on the one hand, and we may have Recreation Shops, Talking and Smoking-rooms, Penny Readings, Concerts, and Free-and-Easies on the other. And you may have all, or any of these combined under one roof, calling the establishment a Workmen's Hall, a Working Men's Institute, or a Working Men's Club, and the said establishment, or any of the separate agencies, will undoubtedly do more or less good while it or they continue. But to start or promote them, however useful and laudable in particular cases, and as preliminary steps, is not the real work now before the social reformers and friends of the working classes of this country. That work is to help bring into being *organic bodies with a living soul in each*, all forming part of a larger organisation which should be filled with a yet higher vital force. You want societies, brotherhoods, inspired with the same noble idea as that which I have attributed to Working Men's Colleges, aiming at the completest culture and development of the mental, physical, and spiritual life of the members which may be possible under the given conditions, yet beginning with the humblest and simplest agencies, meeting the actual social wants of the least cultivated, while offering the means of gradually increasing cultivation as they may be willing and prepared to receive it."

Who will deny that here we find a principle and an object capable not only of binding men together in a permanent organisation, but of inspiring them with that earnestness—even enthusiasm—which I not only admit, but earnestly contend, must be called forth to make a great enterprise successful? And considering how vast and deep must be the nature of such an organisation as is described in the above quotations, we must not wonder that a grand, far-reaching principle and aim should be needful to fill that organisation with life and power.

If it were asked why Working Men's Clubs

* Continued from page 86.

† It must be remembered that in these pages I can speak simply of human agencies, and with only an implied and tacit reference to that which is Divine.

should aim at so much more than gentlemen's clubs, the answer is evident. In the first place, gentlemen have a more liberal and thorough education than working men, not merely at school, but from the mental atmosphere in which they move; and secondly, they have a great variety of institutions, as well as access to a large number of artistic, literary, and scientific influences from which working men have been shut out, and which can be supplied to the latter most effectually by a well-managed club and institute. Persons in the middle and upper ranks, in short, not only have "far greater means and leisure for continuing at home or in the world that culture which they have received at school, but their occupations often have more of a humanising and educational character than the mechanical handicrafts of the working man, while their homes admit of that social intercourse and interchange of visits from which the working men, at present, are precluded by their very limited domestic accommodation. Gentlemen are, in fact, in a position to make their club minister to higher culture when they join it; working men, on the contrary, often need the very culture which alone would make their club profitable to them. Hence there is a far greater number of wants requiring to be satisfied by these clubs, in the case of the working men, than in that of the gentry. On the other hand, a proportionately greater vital force is required to lift working men, and to help them lift themselves, out of the various evils, temptations, and hindrances—social, physical, and moral—which now oppress them, than is needed merely to supply certain simple wants, already felt and recognised by persons perfectly able and willing to help themselves. That force can only be found in great principles working through suitable and varied organisations." *

The only other important point I would now advert to in connection with the causes of success and failure in clubs, before alluding to particular instances of each result, is the advantage of having societies for promoting the *pecuniary* well-being of the members connected with a club. Whenever a room belonging to it can be let to a Friendly, Provident, Co-operative, or Building Society, this not only helps to pay the rent, but draws the working men of the neighbourhood to the club. It is, however, still more useful and important to get the members themselves to form such societies (if they do not already belong to any), to start a "Friends of Labour Loan Society," a Coal club, and so forth, limiting, in general, the advantages of the society to those who are members of the Working Men's Club and Institute. Action of this kind is both a cause and effect of three distinct benefits to the members, naturally resulting from the club:—1st. The becoming interested in other matters than the pot and pipe, and mere animal enjoyments, which have too often been the only things many working men have cared about. 2nd. The saving money, and adding to home comforts—especially laying up against a rainy day—ultimately, perhaps, obtaining the advantages of capital as well as of labour. 3rd. The cherishing that spirit of mutual helpfulness which has been constantly urged as a primary element in the success of these clubs, and one of their principal objects. But in addition to all this, such commercial societies (so to term them) have a powerful influence in binding the members not only to one another, but also to their club, and often furnish the strongest attraction for retaining men in membership.

The truth is, that the wants, tastes, and circumstances of working men are just as various as those of the classes above them; often much more so, on account of the greater incompleteness of their education and development. Hence a club must meet this great variety of taste and want, if it is to have any considerable number of members. Some must be attracted by the amusements; others by the social companionship; some by the reading-room, library, and classes; others by the Provident and similar societies; some will care chiefly for discussion meetings; others for the "free-and-easy," or concerts.

But, whatever the original inducements to join, able and zealous managers will always endeavour to bring the members of a club to care about its other useful and interesting operations.

Before, however, we can effectually investigate the causes of failure or success in individual Working Men's Clubs and Institutes, we must never forget one important distinction to which I have not yet adverted—viz., that a club may have been eminently successful in benefiting its members, and improving the whole condition of the neighbourhood, yet have failed to make both ends meet in its financial department. On the other hand, a club may be entirely self-supporting, and yet be doing very little good. The latter case would, in general, only occur when a building has been presented rent free to the members, or when a special source of revenue is largely prolific (such as the profits from bagatelle boards, or entertainments of a low character), which might bring in a good deal of money, without promoting the well-being of the club and its members.

* "Possibly the clubs of the upper classes may find that they have an important lesson to learn from those of the working men. It is said that some of them are already beginning to feel the want of more sociability among the members, of some more definite bond of union."

Master and Servant.

We have, in former numbers of the Working Man, explained the relations of master and apprentice, and the provisions of the law affecting them.* We purpose now to place before our readers a similar outline of the law respecting master and servant generally, and the obligations it imposes on each in his conduct towards the other. In doing so, we shall more particularly, although not exclusively, refer to that class of service which is entered upon by the great body for whom our publication is designed—the working men of the kingdom—among whom, we are sorry to say, there exists to a very large extent the want of a general knowledge of the principles of the law concerning employer and employed.

Every person who undertakes, for payment, to perform any kind of service for another, to assist him in any part of his trade or ordinary affairs, is styled by the law his *servant*. The term has, therefore, a far more extended application than that in common use, where it is chiefly applied to one engaged as a domestic. It is in this wider sense that we shall have to use the term when speaking of persons employed, no matter what may be the nature of the employment.

The subject is an extensive one, but for the present we shall confine ourselves to

THE ENGAGEMENT.

An engagement or contract of service may be either written or verbal, and may be made by the party who is to serve, either with the master or his agent. Any person who holds such a situation under the master, that by common practice he would be presumed to have power to engage other servants beneath him, is held to be his agent, and an engagement made by that person is as binding on the master as if made by himself. Thus, a foreman of works who may take on additional hands, is presumed to do so with the master's authority, and the master must pay them, unless he has expressly made known his refusal to recognise such an engagement before it has been entered upon.

The contract may be for any period of time, at the pleasure of the parties; but if the service is to last for more than a year, or for a year to commence at any future time, it must be in writing, or it will be invalid. Thus, if a person engage on the 1st of January for a year's service, to commence *on that day*, no writing will be necessary; but if he enter into an agreement on the 1st to serve a year from the 2nd, or any future day, it must be in writing, and signed by both parties, or neither will have a remedy for breach of contract.

In the absence of any understanding to the contrary, either expressed or implied, it is a rule of law that the contract shall continue for a year, but be determinable by a month's notice on either side, or, at the master's option, by payment of a month's wages. This, in fact, makes the service one from month to month. But although this is the general principle, and applies especially to the case of domestic servants, yet in other instances the duration of the contract, and the notice to be given, depend in great measure upon the *custom* in the particular trade or employment. That custom is presumed by the law to be understood by both the parties to the agreement, and they are therefore bound by it, unless a contrary stipulation has been made. In some trades, a weekly engagement and a week's notice are customary; in others, a fortnight's; some employments are, according to usage, for a certain season; others, again, from year to year. But the custom or usage, whatever it may be, is of no account where the parties have mutually agreed to abide by some other condition.

In case of an action at law for breach of contract, the court will not require evidence to prove the rule of a month's warning or a month's wages. But, with respect to any trade or occupation where the practice is other than this, witnesses must be brought forward to prove the usage.

A trade custom, besides affecting the duration of a contract or engagement, may decide some other of its conditions. For instance, where a master may have agreed to pay his servant so much "per thousand," evidence may be brought forward to show that by "a thousand" either a greater or less number was meant or understood in the trade. The parties, in all cases, are supposed to have contracted according to the established practice.

Where an engagement is proved to be, by usage, of a certain duration, and to imply a certain term of notice, the circumstance that wages are paid at more frequent intervals will not affect the contract. Thus, a month's or a fortnight's notice must still be given in cases where that may be the custom, although the wages may have been paid weekly. The same rule holds good with respect to contracts for a longer period.

The engagement or contract, whether written or verbal, gives the master a *right* to the service, and a claim to damages for losing it. It is not necessary, in order to establish this claim, that the service should actually be entered upon. And as, in some cases, the master would really have no pecuniary remedy by an action for damages, when the servant either refused to enter the service after having agreed to do so, or left it without due notice, the magistrates have the power in such cases to punish the delinquent servant for breach of contract by imprisonment. Any one who entices a servant from his employment, or induces him to break his engagement, is also liable to the master's action for damages; but in order that the action should succeed, it is necessary that the master should be able to prove that the person enticing his servant away was aware of his engagement. But the master cannot bring an action against another for inducing his servant to leave, after notice duly given and expired. An action will "lie," or be maintainable, for inducing a servant to leave *piecework*, as well as employment for a definite time.

The contract of hiring may comprise protective clauses in the interest of the master, that the servant shall not, after the expiry of the agreement, enter into the same trade or business within the neighbourhood, or a reasonable distance thereof. But the law will not recognise an agreement, or that portion of one, which attempts to bind the servant to an unreasonable extent. For instance, in a case where the servant had undertaken not to set up in business, after his service, either in London or any other town in England, the court held that so much of the contract as related to the metropolis was valid, but declared the remainder void.

An agreement, whether written or verbal, may be rescinded by word of mouth, or a new and substituted agreement entered into in the same way. But where the original contract has been in writing, it is best, as a rule, to have any alteration of it in writing also, as in that case it is more capable of proof should the matter come in dispute. Where only one party possesses the contract in writing, the other having neglected or declined to take a copy of the document, and any dispute arises, the person possessing the contract may be required to produce it in court. In case of refusal to bring it forward, the party requiring it may state its contents; and the refusal alone would probably be as damaging to the defendant, in the minds of judge or jury, as the clearest evidence of delinquency from perusal of the document.

We have now said all that appears to be necessary, in this outline of the law, as to the general contract of hiring. We must ask our readers, who may be particularly interested in the matter, to look carefully at the principles here laid down, which will be found to meet a great variety of cases that constantly arise in every-day business.

* See "Apprenticeship: its Rights and its Duties," in Nos. 3 and 4.

Honest Labour v. *Burglary.*

I sometimes occupy the quiet half-hour between supper and bed-time with a dip into the newspaper. I have not a very voracious appetite for news; but, of course, I like to know something about what is going on in the world, and occasionally my attention is arrested by the report of a trial involving something more than matters of scandal, which, indeed, I would rather be unacquainted with. I hear and see quite enough of the wickedness of the world without desiring to hear any more; and wish in my heart that a veil could be drawn over the faithlessness and open profligacy, the records of which occupy such a large portion of our newspapers. But the report of an action brought by a jeweller, in Cornhill, against the maker of an iron safe, referred so directly to matters within my own experience, that I went on reading. We all must remember the burglary which was so much talked of a year ago, and which was so carefully planned and ingeniously performed, that the perpetrators would have escaped detection, so far as any police investigation was concerned, had it not been for private spite, which afforded information otherwise unattainable.

I know something—as much as most, indeed—of the strength of metals and the principles of construction; and I never expected that any safe could successfully resist the patient application of skill and strength, aided by proper tools. So, of course, I was not very much astonished when the convicted thief told the Court of Queen's Bench that, having first applied a wedge, and then a crowbar, he had prised the safe open. But I was astonished to hear him complimented on his cleverness—of course, with a mild expression of regret that his talents had not been applied to a better purpose. What did he do, after all? He hid himself in a house, actually left open for his reception, and then, having time, skill, and proper implements, he did rather a neat piece of blacksmith's work! There is hardly a man in our shop who could not have done the same, if the job had come before him in an honest manner. There is nothing clever about it.

But he must be clever, I suppose, because to a certain amount of mechanical skill he adds fluency of speech and audacity. Here again I could match him out of the circle of my immediate acquaintance. I know many young men who frequent debating clubs, and judge and jury societies, who have a natural fund of humour, which is sometimes uncommonly like impudence, and who, by constant practice, have so cultivated what George Stephenson called "the gift of the gab," that they astonish their more silent shopmates, who know they are right in the view they take of matters in dispute, but cannot easily put their ideas into fitting words. Caseley, the convict, who is so very "clever" and interesting, appears to be one of this sort, adding roguery to flippancy, and to be a victim to that peculiar sort of laziness which takes ten times the trouble to shirk honest work that the work might be done with.

And how hard these scoundrels *do* work after all! and how very poorly they get paid for it. I should not like (my sense of right and wrong out of the question) to hang about night after night, for several weeks, to watch an opportunity for theft, at the risk of being caught in the fact, and with the almost certainty that, sooner or later, I shall be detected, and pass a great many years of the best part of my life in a convict's garb, living on convict's fare, doing a convict's miserable work, and associating only with scoundrels guilty of every crime of dishonesty and violence.

Honesty *is* the best policy. It pays best in the long run. It ensures peaceful living, and a peaceful end of life; it procures, with industry, moderate competence, and makes yourself and your memory respected. Dishonesty is not clever—it is short-sighted, unreasoning, and essentially foolish. I remember an etching by brave old George Cruikshank, in which he depicted rogues of every degree as fools with caps and bells. So they are: fools, who, gifted with fair mechanical skill, and passable powers of application, set to work to carve out for themselves a passage to Newgate and the convict hulk.

I want to hear no more of such cleverness. There are thousands, as I have said, with equal manual skill, who are wise enough to labour honourably, and enjoy in peace the fruits of their toil. Perhaps they may not be publicly complimented for their cleverness; but their conscience will approve the use they have made of the talents entrusted to their care.

Fish and Fishmongers.

Regret has often been expressed at the subordinate place which fish takes as a staple article of food in the daily consumption of the people. It is felt to be regarded rather as an adjunct to the principal meal of the day, than as an all important dish; a delicacy to be enjoyed, rather than a kind of sustenance to be depended on. But it is just possible that the wholesale destruction of our bovine stock through the rinderpest, and the consequent increase in the price of all kinds of meat, may compel many to turn to fish as a substitute for flesh, seeking in the food furnished by our seas and rivers an aliment more suited to their means than the steak, the chop, or the more pretentious "joint" seems likely to become. In any case, the supply and sale of fish is a subject worthy of our best consideration.

The question of the supply of fish naturally leads one to Billingsgate, the great metropolitan fish market; and what Billingsgate is like has been told again and again, nor is it now changed in any essential feature from what it formerly was. A sloppy, slimy, fishy Babel it is, with an odour, pungent and oleaginous, which catches you by the nose as you pass the Monument, descending Fish Street Hill, and never relaxing its hold till you reach Tower Gate. Not that this odour is precisely offensive, but it is strong and obtrusive, and not to be shaken off, even long after you have left the precincts of the spot where it has its seat. It penetrates into your hair and the cloth of your coat, like the smell of tobacco, and clings to you with equal tenacity.

Then, if Billingsgate is not inodorous to the sense of smell, neither is it picturesque to the sight. Everything there is for use, and very dirty use, too; and, consequently, Billingsgate dresses in coarse woollens, and leathers, and oilskins, and covers itself with wide-awakes, and billy-cocks, and sou'-westers innumerable. And Billingsgate is hustling, and shoving, and corn-treading, and more especially loud-voiced and vociferous, and withal not unmusical. Billingsgate shouts and roars, and rolls its voice like the billows of the sea, as it gives forth its auction-bids, or holds aloft its baskets of live plaice to cautious buyers. Billingsgate, no doubt, could be vituperative if it liked, and on occasions is so, but as a rule it is not. It may be noisy, but it does not, therefore, follow that it is abusive; and Billingsgate has got too much to do to mind its own business to trouble itself about wasting language, much less bad language, for unnecessary purposes.

Altogether, Billingsgate, although startling, and even deafening, to a stranger; though it bewilders you by its crowds, its hustling, and its confusion of boisterous tongues; though it steeps you in fishiness for a whole day after your visit; and although there are no picturesque Masaniellos or attendant fishermen to give a dramatic character to its exterior, and everything connected with it is plain, blunt, work-a-day, and of all things sloppy and sticky, it has a character of directness, of broad practicability, of unstudied, honest usefulness.

In some points less, yet, on the whole, greater than ever, Billingsgate market maintains its position as *the* fish-market of the United Kingdom. It has no longer its tier upon tier of broad-bowed coasters, waiting for their turn to disgorge their full holds, or water-wells, of their contents; and it is no longer the centre to which all the produce of the neighbouring, and even of distant seas, is brought, to be thence distributed throughout the kingdom; but if it has in so far "suffered a sea change," the railways bring more fish to its net now than all the old water-tubs that ever floated did before. By means of the railways, the modern cutters, and the two or three steamboats which serve as carriers between Gravesend and Billingsgate, collecting the several "hauls" of numerous fishing-smacks, the market is better supplied with fish than ever. Fish, as a perishable commodity, must be brought quickly within reach of the purchaser; and the fishermen, instead of beating round the coast at the mercy of winds and waves, in their endeavour to bring their freight to market as formerly, now keep to their proper business of catching fish, and leave the carrying to more competent hands. Thus the fish—in the first case more carefully preserved by the application of ice when caught—are sent up to market by rail and steamer, and Billingsgate receives it for general distribution, not only more abundantly than before, but in a fresher state, and, therefore, better fit for food. Of course, thousands of tons of fish are now distributed over the country which never come to Billingsgate at all, but are dispatched direct from the sea-coast by rail to the principal towns inland; and in so far Billingsgate may be said to have lost some part of its business. But this loss is more than compensated by the greater supply furnished through increased facilities of transport.

How many tons of fish, then, pass daily through this great emporium of sea produce? Upon this point Billingsgate is lamentably silent. There are no returns given; no data kept from which a computation can be made. This fish market is not like a meat market, or a corn market, or a hay market, with regard to any one of which exact records are kept of all that passes in or out of its gates, or market-place. There is a sort of independence about Billingsgate which defies arithmetic. Beyond the payment of their stall, or shop-rent, no one but the individual concerned seems to know how much or how little business is done.

The reply to questions upon this head is that any such return is impossible. The question is met in perfect civility with a negative, and it is argued that the entries are so various, and arrive from so many sources, that any accurate return of the whole is a thing not to be done. So, also, with regard to the average price of the goods sold, Billingsgate is dumb. One may learn any day the current prices of meat at the Metropolitan or Newgate Market; the quotations of corn in Mark Lane; but Billingsgate is above quotations, and buys and sells as it likes, and tells no tales. Again, it is said that any authoritative price-list of any one market-day cannot be given. The value of fish of the same size, weight, and—to an inexperienced observer—quality is so different, and the transactions so multifarious, that no general conclusions can be drawn as to price. One is at liberty to perambulate the market, and to take a stand at any one of the impromptu stages at which fish auctions take place. There is very little parade and very little ceremony. The auctioneer, who is, most probably, the owner of the fish he sells, does not study appearance; but book in one hand, and possibly the other curled round his mouth, and resting against his cheek, in order to give his voice additional depth and force, announces the upset price, and repeats the several biddings with a power of lung which would do honour to the master of a kennel, when giving the view-halloo.

Perhaps the basket of plaice, crammed as it is to the top, so that the lid is held down by cords, and is still a long way from closing, and which a labourer carries on his head for public inspection, may be sold for 4s., 5s., or 6s.; but its weight, and the number of fish it contains, no one can tell but the seller and the purchaser. Only recently, the *Times*, in a leading article, asserted that the fish sold at Billingsgate Market fetched, on an average, £4 10s. a ton, which assertion was met by a correspondent, who claimed to be a constant buyer at the market, by the statement that on no occasion had he paid less than 7 guineas, and that more frequently his outlay had been as much as 50, 60, and 70 guineas a ton. So much for averages.

To a superficial observer there would appear to be no great difficulty in keeping a tally of all fish brought into the market for sale, or even of the current rates per day of the principal kinds of fish sold—and such a record would be valuable; but it is quite evident that no such return will ever be made by the voluntary efforts of the market authorities. That an approximation to the real amount of sales is possible, is evidenced by some few isolated facts in regard to salt fish. It is stated that 12,000 barrels of salted cod are brought to Billingsgate from Holland and Scotland during Lent, and sold to the London consumers; and that 500 tons of "split fish"—or dried cod, from Newfoundland—are disposed of during the year. Another little item is the amount of smelts brought from Holland, which is estimated at 1,200 baskets a week. We might imagine, with these data before us, that some general estimate of the total amount of fish bought and sold might well be rendered.

The Proposed Franchise of Intelligence.

At length—so it seems—a formal attempt is to be made to give intelligence legal recognition in England. Mr. Clay, M.P., has announced his intention of proposing that political enfranchisement be extended to such of the people as may possess an ascertainable amount of actual knowledge. The proposal comes, oddly enough, from the sea-coast. We should have thought it was likely to originate inland, and nowhere else. It turns out that Mr. Clay's proposition smells strongly of the sea. It none the less deserves a welcome for that. The examination that serves to give a tide-waiter his credentials of office is, we understand, Mr. Clay's idea of what might suffice for the suffrage.

It is not our intention to enter upon any criticism of a question of party politics. We limit ourselves now, as in a former article, to what is admitted on both sides of the House of Commons—namely, that the suffrage may usefully be extended so as to include some portions of the working classes; though what portion, to what extent, by what methods, or for what reasons, are points on which no common agreement as yet exists. All that seems to be agreed upon is, that the Government ought to deal with the question, and that their plan, whatever it is, is to take precedence of all others.

The Government plan is sure to propose a limited extension by a method well known—namely, by permitting a lower household franchise. Mr. Clay proposes not to touch this plan—which will go but a small way. Earl Russell always prescribes very short journeys for the improvement of John Bull's political health. The stout patient is always treated as being in a very critical condition—undoubtedly plethoric, congested, and incapable of bearing the slightest excitement. Mr. Clay, being well aware that the Government Bill will omit the great bulk of the people, proposes to make an addition to it. He would enact that a knowledge of writing, spelling, and the four rules of arithmetic and their compounds as applied to money only, be deemed a qualification for the franchise. This is the examination to which out-door officers of the Excise are subjected. This plan is nearly as simple as that suggested by Mr. J. Stuart Mill.

Some time ago a proposal was made in a brief series of letters addressed to Lord John Russell, of an intelligence franchise of a different description, and which promised more obvious fitness in the elector for the discharge of civil duties. This plan involved an examination as to the general knowledge the candidate for the franchise had acquired in the elementary principles of Political Economy and English Constitutional History, from the perusal and study of two small volumes upon those subjects. It would be possible for any person to acquire this information, and everybody would be the better who had it. As a workman, he would become aware of the social laws affecting his labour; as a citizen, he would understand the political law affecting his liberty.

In the case we have just referred to, and that of Mr. Clay, the proposal is made in a practical spirit, being put forward merely as an addition to the Government bill, and not instead of the existing franchise, or of any extension of it, but only as a supplementary mode of extending the suffrage in a gradual manner, as fast as the public intelligence increases. Nobody professes to be afraid of intelligence; nobody, therefore, ought to be afraid of such a plan as this. It would have the merit of giving an entirely new interest to schools, mechanics' institutions, and every form in which the intelligence of the working class is sought to be promoted. In fact, it would give political interest and importance to innumerable educational institutions that now languish. Every friend of the working class would have a new motive for promoting their education. To make them citizens would be to make them wiser. The franchise could do them no harm, and the knowledge would be sure to do them good. To give a man a vote because he lives in a £10 or £6 house is all very well as far it goes; but it is very much like giving a suffrage to bricks instead of to brains. It encourages a gross materialism of thought, of which we have too much, and makes householding or money-getting the highest test of civic virtue. Every man cannot get richer at will. The most deserving often struggle in vain against the pressure of adverse circumstances. But every man can get knowledge who has the right will and moderate application. On all accounts, then, the proposal of Mr. Clay is deserving of commendation and support. Mr. Disraeli had the merit of being the first English statesman who ever proposed to politically recognise knowledge as a qualification for citizenship. His plan had not the popular merit of Mr. Clay's, but it had the merit of admitting the principle.

We are quite aware that there are difficulties to be encountered before any such plan will meet with ratification in the House of Commons. The electioneering agents are opposed to any scheme which is likely to throw their calculations into disorder. The slow increase of property can be estimated. The probable increase of £10 or £6 houses is known. The changes in the electoral balance, under a property qualification, can be foreseen. But no man can foresee the increase of intelligence. Batches of new electors would spring up every three months. New voters would appear in the solar system of politics, like new comets, and the Parliamentary astronomers would never be able to calculate their orbits. With this, however, we have nothing to do. It would be weakness, or imply defect of vision, to write upon this subject and betray no consciousness of these facts. Having recognised them, we may dismiss them to be dealt with by the politician. Our concern is with the principle of an Intelligence Suffrage: it is the most rational, creditable, and practical ever devised. So long as our statesmen do not take honest manhood as a qualification for political rights, but prefer to seek an artificial test of electoral fitness, then we must say that Intelligence is the most philosophical, fit, and useful. The principle gains strength and popular acceptance every day, and we do not despair of seeing Mr. Clay's proposal—which is to be the subject of a specific Parliamentary motion—grow into public favour. It concerns the interest of working men that it should be so. It will increase their opportunities of knowledge and chances of citizenship. It will enable a man to command his own enfranchisement in the way safest to the State and most honourable to himself—namely, by the exercise of thought, and cultivation of his understanding.

Representative Men.

I.—BENJAMIN WHITWORTH, M.P.

To the more thoughtful and enlightened class of employers, now becoming so numerous in this country, belongs Benjamin Whitworth, the Parliamentary representative of Drogheda. Few men have done more to win the respect and esteem of their fellow-countrymen than has Mr. Whitworth, and well is it for the interests of both capital and labour, that his services should have been so readily appreciated by those who have derived benefit from them. The fifth son of the late Nicholas Whitworth, of Drogheda, he was born in Manchester, May 24th, 1816. In 1820 he was taken to America, where he resided at Philadelphia until 1824, in which year he returned to Manchester. A few months afterwards he removed to Drogheda, where his father took up his permanent residence. In 1832 young Whitworth returned to Manchester, where, after much difficulty, he procured a situation in a warehouse, commencing with the magnificent salary of five shillings per week! Little dreamed young Benjamin Whitworth of the future that was in store for him. True, many would have calmly folded their arms, and desisted from further effort. Not so was it with Benjamin Whitworth. His heart was made of the right stuff, and when he planted his foot upon the first round of the ladder, he had already determined that he would do his best to mount a little higher. For six years he had to contend with difficulty after difficulty; and then, like many others of our self-made Lancashire men, he determined to commence business on his own account, in partnership with Mr. John Hoole. Their united capital amounted to £50—not a very large sum in the estimation of a Manchester *millionaire;* but then some of our merchant princes have begun with even less—so that Benjamin Whitworth and John Hoole were not without precedents in justification of the step taken by them.

The partnership was not, however, of very long duration; for in 1842 it was dissolved, when Mr. Whitworth, his younger brother Alfred, and subsequently, his other brothers, Robert and William, went into partnership with him. In 1843 he married, three sons and four daughters being the fruits of the union. In 1849 his health was so shattered by over-work, that he was advised to leave Manchester, and take up his residence at the sea-side. Choosing Fleetwood, he, for thirteen years, travelled constantly backwards and forwards between that beautiful Lancashire watering-place and the busy metropolis of the Cotton Districts. All this time Fortune was smiling upon his endeavours; and while at Fleetwood, he conceived the idea, afterwards carried out by him, of importing in his own ships cotton from America to Fleetwood. The attempt proved a remarkable success, and helped greatly to develop the trade of that port; but since the breaking out of hostilities in America, the traffic has entirely ceased. Mr. Whitworth is now, however, about organising it afresh. The importance of this trade may be estimated by the fact, that the charges upon cotton coming into Fleetwood do not exceed *one-sixth* of those enforced at Liverpool.

In 1863 Mr. Whitworth commenced, at Fleetwood, the building of the Whitworth Institute, intended principally for the use of his *employés.* It was completed and opened at the end of the same year, and promises to be useful and pros-

perous—being quite self-supporting. The cost to Mr. Whitworth of this institution was about £3,000. In 1864, he laid the foundation of a similar, but much larger building, in Drogheda—where Mr. Whitworth has large manufacturing establishments—which was opened in May last by the Lord-Lieutenant of Ireland.

The cost of this building, defrayed entirely by Mr. Whitworth, will be about £4,500 when fully completed. Much of the interest taken by Mr. Whitworth in the social improvement of those employed by him is attributable to the circumstance of his being a teetotaler. From his very infancy he has been an abstainer from the use of intoxicating drinks, and to his views on the temperance question may be ascribed his determination to build the Fleetwood and Drogheda Institutions, which are to be conducted on principles similar to those of the Working Men's Clubs—the idea of Mr. Whitworth, in building them, being to further the cause of temperance, by finding some means of rational and innocent amusement for the working classes. The institutions are supplied with billiard, bagatelle, chess, and draught boards, &c. There are also news-rooms, and, at Fleetwood, a good library.

Since Mr. Whitworth's return to Manchester, in 1862, he has been intimately connected with the "United Kingdom Alliance for the Suppression of the Traffic in Intoxicating Liquors," to the guarantee fund of which he has promised £3,000. On the dissolution of Parliament in July last, he was invited by a large majority of the influential electors of Drogheda to represent that ancient borough in Parliament. Consenting to become a candidate, the polling day found him returned by a majority of at least three to one over his opponent; so that the man who began life in a warehouse, at five shillings per week, now sits as representative of Drogheda in the British House of Commons! Who, after this, will despair of getting on?

Well did Mr. Whitworth merit the support of the men of Drogheda, for in that town he has built a large cotton factory, capable of holding 1,000 looms, and affording employment to nearly 800 hands, who will be at work within the next few weeks. This is better than Fenianism as a remedy for Irish poverty and social ills; and we trust that the present senseless Fenian agitation in Ireland will not have the effect of deterring others from emulating the beneficent example of Benjamin Whitworth. But we have not yet exhausted the record of his services. Drogheda had long felt the want of a plentiful supply of pure water. For twenty years Mr. Whitworth's father had agitated in favour of the want being remedied, but without success. Some time before his death, in 1845, he expressed a wish that his son would attempt to carry out his pet project. Of course, the words of his father were not lost upon Mr. Whitworth, and, in 1863, he made a proposal to the corporation to find the whole of the money required at 4½ per cent., or he would find one-half the money at 4 per cent. The corporation refused this offer, upon which Mr. Whitworth started a limited liability company to accomplish the desired object, at the same time agreeing to find half the requisite capital. The works are nearly completed, and are expected to be opened during the ensuing spring. The firm of which Mr. Whitworth is the principal is largely engaged in the fustian and velvet trade; also as manufacturers, at Kirkham, Accrington, and Drogheda. Mr. Whitworth is also considerably interested, either as a shareholder or director, in the Ashbury Railway Carriage and Iron Company, Limited, Manchester; John Brown and Co., Limited, Sheffield; Bolckon, Vaughan, and Co., Limited, Middlesboro'; the Stavely Coal and Iron Company, Limited, Stavely; the Sheepbridge Coal and Iron Company, Limited, Sheepbridge; the Manchester Carriage Company, Limited, Manchester, &c. Such a man, either as a self-made person, a capitalist, a social reformer, or an enlightened employer, is an acquisition to the House of Commons, and cannot fail to be heard to good purpose in all questions which affect the interests of employers and employed.

BENJAMIN WHITWORTH, M.P.

*What Governs the Rate of Wages?**

BY ARTHUR HOUSTON, M.A.,
Whately Professor of Political Economy in the University of Dublin.

In an article that appeared in the sixth number of the Working Man, we endeavoured to ascertain the precise character of the laws which the rate of wages obeys, or, to use a form of expression less open to objection, the influences by which it is affected. For this purpose it became necessary to consider the nature of the laws of Political Economy in general; and it appeared, we trust, sufficiently plain that it was a mistake to regard them in the light of inflexible rules, which no human effort would avail to abrogate or amend—irresistible forces, all opposition to which would be as disastrous as it was vain. We thought it necessary to denounce this dogma, this new form of fatalism, which represents the human race as the sport of powers resistless and relentless as the destinies of classic fable, whose favour is to be conciliated by a humble submission, and to whom the future of the species is to be blindly entrusted, in the vague hope that they will in the end bring us to an economic millennium. The laws of that branch of Political Economy within which questions concerning wages fall, were found to be of quite a different character. While some of them have their source in the nature of things—in the bodily and mental constitution of man, and the condition of the external world—and are, therefore, in no way the work of our hands, others are altogether the creation of society, which by some of the various instruments through which it makes its power felt, by law or usage, by physical force or moral compulsion, modifies or destroys the effect which the former would, if unimpeded, produce.

Having clearly apprehended this fundamental truth, our next step will be to inquire what, in the case of wages, are those natural laws whose influence it is sought to control for good?

Now, the law which more particularly applies to the rate of wages is that which is known as the law of demand and supply. It may be stated in the two propositions following:—1. Under a system of unrestricted competition, the value of any article of commerce has a tendency to *rise* with every *increase* in the *demand*, and with every *decrease* in the *supply*; and has a tendency to *fall* with every *decrease* in the *demand*, and with every *increase* in the *supply*. 2. The level at which value finally settles is such, that the quantity of the article offered for sale at that particular value will be exactly equal to the quantity which, at that particular value, purchasers will be willing to buy.*

Such being the universal law of value applicable to every article of commerce, labour, whenever it becomes an article of commerce—in other words, whenever it is offered for sale—must have its value determined by this principle. And it is, perhaps, not immaterial to remark that the nature of the services rendered by the labourer makes no difference in this respect. Under a system of pure competition, the reward of poet, artist, and actor, lawyer, physician, and divine, artisan, factory operative, and farm-servant, is regulated altogether by the demand for, and the supply of, the particular class of services they severally perform.

Confining our attention, however, to the class with which the Working Man is more especially concerned—namely, those who labour with their hands—let us inquire what are the circumstances upon which the demand for, and the supply of their services, depend?

Now, as to the former—the demand—who are the great purchasers of labour? Government buys some; the State employs many thousand men as soldiers, sailors, and police; private persons purchase a good deal, that of domestics especially. But large as is the demand of the State and private persons combined, far the greater proportion of the labour of the country is bought by capitalists; and it is upon their requirements that the demand for labour principally depends. Leaving out of consideration any question respecting the extent to which, in the progress of invention, manual labour is superseded by machinery, the quantity of labour required by a capitalist is determined by the amount of his capital. In a discussion, then, necessarily so concise and practical as this, it may be laid down as a general proposition that the *demand* for labour increases with the increase of capital, and diminishes with its diminution.

* Continued from page 89.

* It would be out of place to enter here upon any proof of these principles. The experience which every one has of the fluctuations of price in articles of ordinary consumption, and of the circumstances under which they occur, will bear out the statements in the text sufficiently for our purpose. Those who wish to probe the subject more deeply will find it treated with his usual perspicuity by Mr. Mill, in his "Elements of Political Economy," Book III., chap. ii.

The *supply* of labour, on the other hand, evidently depends on three things:—1. The number of persons able and willing to work. 2. The amount of exertion each of them puts forth in a given time; in short, their average *energy*. 3. The proportion of his time which, on the average, a labourer spends at work; the number of hours in the day, of days in the year and of years of his life he is actually engaged at his occupation.

Such being the circumstances upon which demand and supply depend in the case of labour, its value obviously tends to rise or fall according to the increase or decrease of capital, and according to the decrease or increase of the number of labourers, their industrial energy, and the time they work. From this, the further inference immediately follows—that to act on the value of labour, it is only necessary to act upon capital, on the one hand, or upon the number of labourers, their industrial energy, or the duration of their period of work, on the other. These four things constitute the mechanism through which any alteration in the value of labour is to be effected.

While maintaining, however, as we have done in the most unequivocal and emphatic manner, the possibility of controlling the spontaneous action of those laws of Political Economy which spring from the natural constitution of things, we think it right to add that we are by no means insensible of the extreme danger of making any attempt to do so without sufficient consideration. The economic forces at work in society are so various, and they so act and react upon each other, that, until the possible results of any proposed interference with their operation has been pursued through its remotest ramifications, to take a single step is full of risk. An example will suffice to set this in a clear light. Suppose it were considered desirable that the hours of labour should be universally reduced, and that, to this end, a law were passed limiting them to three-fourths of their present duration. Assuming that this law were strictly enforced, the labourer would undoubtedly receive for his seven or eight hours' work as much as he had previously obtained for ten or twelve. The demand for labour, represented by the capital of the country, remaining unaltered, and the supply being reduced one-fourth, its value would rise in a corresponding proportion. So far, the desired result would be attained, and in appearance all would be well. But this rise in the value of labour would produce ulterior consequences calculated to lower it again, and to curtail the wages of the labourer in the same ratio as the hours of labour had been reduced. The value of labour having risen, the rate of profit would be lowered. Less work being turned out, owing to the shorter hours of labour, and the same amount being paid to labourers as before, the returns of the capitalist would be diminished, while his expenses would remain the same. It might be supposed that he could reimburse himself by putting an increased price upon his goods, and to a certain extent this is the case. For a time, prices would be higher than before; but so far as they were, the capitalist would be nothing the better for it, and the labourer would be all the worse. The former, if he got higher prices for what he sold, would also have to give higher prices for whatever he afterwards bought; and, therefore, as much as he gained in one way he would lose in another. But the labourer, receiving no higher wages than heretofore, and having to pay more for what he consumed, would suffer a loss for which he would obtain no compensation. So long as this state of things continued, the labourer would simply do less work; and, though receiving the same wages measured in money, would receive less wages measured in the articles he consumed. But, as we have said, such a rise of prices would be only temporary, the former level being speedily restored by the action of laws which it would be impossible to explain here. So soon as this occurred, it is clear that then, at all events, the entire loss resulting from the reduction in the hours of labour would fall on the capitalist. He has obviously no means of escape. But the instant that this diminution in the profits of capital made itself felt, those who had been in the habit of saving for purposes of investment would lose a portion of their usual incentive to the practice of economy and self-denial. As less could be made of money when saved, less of it would be saved, and the stock of capital in the country would be diminished, or at any rate its further accumulation would be checked. But we have seen that the *demand* for labour may be taken as co-extensive with the quantity of capital in the country, and that everything which tends to diminish this quantity tends to diminish the demand for labour and to lower its value. So that a measure which was designed merely to benefit the working classes by reducing the hours of labour, might have the further effect of reducing their earnings in a like proportion.

This example will serve to show how ill-directed efforts to extend the spontaneous action of economic laws may defeat their own object, or at least produce effects more disastrous than those it was sought to avoid. In our opinion, the action of these laws may be beneficially modified by means which society has at its command, provided these means are properly chosen and judiciously employed; but they are edge-tools, not to be rashly handled by the unskilful workman.

Letters from Lancashire, by a Lancashire Lad.

IV.—CO-OPERATION IN ROSSENDALE *(continued)*.

Having, in my last, given a very faint sketch of the circumstances amid which the Co-operative movement may be said to have had its origin, I now proceed to the further description of the work in Rossendale. As I have said, the business done at Bacup was at first very small, and as all concerned were workers, chiefly at cotton mills, it could not be expected that it would go on with any great rapidity. Clubbing their moneys together each week-end, the persons appointed would trudge off to Todmorden or Rochdale, and there buy what might be needed. It happened more than once that, owing to the distance which it was necessary to carry the articles, the distribution could not take place until Sunday morning. It is said that at first the profit left for division amongst members, after the distribution of the goods had been made, did not amount to more than 1s. 6d. or 2s.

The next step was to keep some little stock on hand. This was managed by each member contributing some few pence weekly until a certain amount was raised, and then the whole was spent in stock. Then, instead of having a division of goods each Saturday, the members could buy what they wanted any evening in the week. Of course it was necessary to spend money upon articles which all shopkeepers must have; and some of the men who have a part in the large business which Co-operation is doing now, look somewhat comical as they tell about the grave debates which took place upon the purchase of a pair of scales, or about the setting up of the first counter. The salesmen, of course, were at first a little clumsy; and we fancy that those of them who had a keen sense of humour, must have appreciated the opportunity of burlesquing the patronising, as well as the patronised manner, of the big shopkeeper. Before twelve months had passed, the number of members had increased so considerably, and the business done was so large, that the premises below the attic had to be taken; and instead of "Shanks's pony," a horse and cart was employed to carry the goods. It was only possible to have the Co-operative Shop open at night, because the men who acted as salesmen were engaged at the mill during the day. At first these men did their work without receiving any pay at all, but after a while a small sum was allotted to them, not in any sense proportionate to the services they rendered, but just an acknowledgment of indebtedness. The men themselves did not look for pay; they thought too much of the chance of redeeming themselves and their fellows from the evils of absolute poverty. They had got hold of a new notion of how to prepare for a rainy day, and were bent upon testing its worth. I have seen recently the expression of a warning to Co-operators, which tells them to mind and not look to their scheme for more than it can properly give. "It is," says the writer to whom I allude, "only a pounds-shillings-and-pence movement, and that, as a new gospel for the poor, is to endanger rather than to forward the higher interests of working men." So far as my own observation has gone, I do not think there is much to fear as yet. The material dangers which threaten working men are such as to make me glad to note the spread of what may seem to some so sordid a movement as this of Co-operation; but in the working of it, it is impossible to prevent the germination of ideas which have a larger meaning than we attach to mere buying and selling. The association of men, all bent towards one purpose, all necessarily practising such virtues as abstinence and self-denial, and all participating in such practical, economic lessons as are a thousand times more forcible than the same lessons when set forth only in books—such an association is sure to realise much more than the mere pecuniary profits which are recounted in half-yearly balance-sheets. To me it has seemed that the great want of working men was the knowledge which Co-operation is giving them. Trades' Unions have too often acted as a man would act who should attempt to split a piece of wood by trying to force in the thick end of his wedge first. They have, as a rule, only embittered the relationship existing between master and men; and, losing all sight of what is, after all, most important to every working man—perfect freedom in the exercise of his labour—have been greater tyrants than those whom they have denounced. If Trades' Unions would only teach their members what Co-operation is teaching, and would more and more base their actions on the economic truths which are so admirably developed in Co-operative Societies, they would soon be raised above that atmosphere of suspicion which, unfortunately, does at times envelop them. Pardon this digression. I think we should do wrong if we believed that the bulk of the men most nearly concerned were making too much of Co-operation. It would be well if they could convince others to see as far as they do. I have said that the Rossendale Co-operatives—at least such of them as took the part of salesmen—were at first rather clumsy. A story was told to me which illustrates this, but I do not know whether it is worth repeating. In one of the lesser Rossendale towns a Co-operative Society was started, and the members, residing at that end of the valley which is most distant from Bacup, went to purchase goods at Haslingden. The day of opening came, and the poor fellows inside the store were busy arranging things, so as to display their goods to the best advantage. I suppose treacle was there, as it was elsewhere in Lancashire, an article of large consumption amongst children; but as the Co-operatives had not the orthodox can from which shopkeepers pour that thick fluid, it was placed in a large mug. One of the men passing this mug with the half-cheese which was the whole dairy produce they purposed exhibiting, was so clumsy as to let it go souse into the treacle. The consternation was great; but the evil was amended. In some places the men were so susceptible of the ridicule which might be thrown upon their amateur shopkeeping, that they drew lots—drew "outs," they would call it—to decide who should open the shutters on the first night. The intense interest which the Bacup men took in their experiment was such as to induce them to try all sorts of devices to make the little they had go a great way. There is one story of a man who tried if less flour would not suffice for himself and family by cutting an inch off the open end of the flour-bag. What his success was in in that matter I don't know; but I know that the man has, since then, amassed so much property—and all in Co-operative concerns—that he is now entirely free from the necessity of labour.

In the second year the Bacup store numbered members by the hundred instead of by tens, and its business was become so large, that it was found impossible to serve all the customers in the time during which the store was then open. The consequence was that the shop had to be opened in the day, and a shopman engaged to attend to the customers. In the third year it was necessary to have two shopmen, and the shop itself was become too small. They set bricklayers and joiners to work, had the shop new fronted, and enlarged as much as was possible. Then they thought that, as they had succeeded so well with groceries, they might try what they could do with drapery. A man and two girls were engaged to manage the new department, which was at once as successful as the most ardent could expect.

From the time of starting to 1859, the Co-operative movement had become so popular in Bacup that the number of members had risen to 758, and from that time, until it is now 2,456. It is very pleasant to think that whilst here and there societies succumbed to the pressure of the distress, the majority of them, like this of Bacup, escaped without much danger. The following little table may be of some interest to your readers, indicating the business done, profits

realised, and showing just a little of the effect produced by the distress:—

Quarter ending	Sales.	Share Capital.	Profits.	Dividend to Members.
	£	£	£	s. d.
Dec. 31st, 1859	12,613	7,169	1,822	2 11 in the £1
„ 1860	19,510	9,245	2,899	3 0 „
„ 1861	19,608	13,439	2,757	2 10 „
„ 1862	13,095	8,777	1,722	2 8 „
„ 1863	14,714	8,355	1,693	2 4 „
„ 1864	15,122	9,141	1,955	2 4 „
„ 1865	20,453	12,282	2,598	2 4 „

The society has so grown, that now it does business in the handsomest building in the town. It has a staff of some score of servants, and many departments, where different trades are carried on. It has a large hall, in which I myself have seen some thousands of men assembled. It has a commodious reading-room, in which its members can read papers and magazines free of cost; and has a library which supplies them with reading at home.

(To be continued.)

Ammoniacal Gas.

Attention has recently been directed to the application of ammoniacal gas as a motive power. The properties upon which this new application is based, are—1st. The great solubility of ammoniacal gas in water.* 2nd. Its easy liquefaction. 3rd. The faculty it possesses, at ordinary temperatures, of supplying manufacturing pressures. 4th. The possibility of superheating its vapours without attaining too high temperature. 5th, and as completely essential — firstly, the possibility of collecting and dissolving it; next, *that of abstracting from the utilised vapours the latent caloric they contain, to transmit it to the vapours about to be formed, and employed anew*—a triple phenomenon, produced simultaneously by the simple fact of the solution of this gas in water.

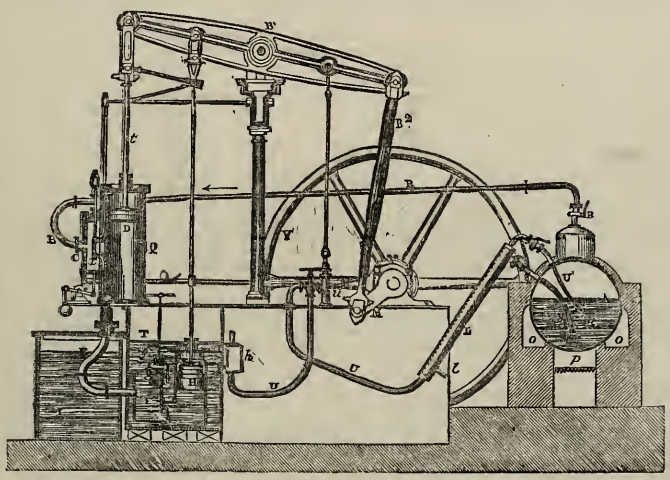
If we store up in any enclosed space a certain quantity of liquefied ammoniacal gas, and at the same time have a quantity of water about three times greater, we can vaporise all this gas, and utilise it as a tolerably constant motive force at a pressure of eight or ten atmospheres; as the latent caloric needful to the gasification will be constantly supplied by the caloric of condensation disengaged in the aqueous solution. If, therefore, in a large manufactory employing powerful means of action, natural or artificial, the ammonia be collected and liquefied, this substance, conveyed in a liquid state to where it must be employed, will furnish instantaneously, without preparation, a motive power which may be employed economically. The solution of the collected ammonia formed will be ultimately carried to the factory, its ammonia abstracted from it, then liquefied anew, and conveyed to the place where it is utilised.

This transfer to and fro may, at first sight, appear a difficulty. It is really a very trifling one; for if we consider that with 22 lbs. of liquefied ammonia we can obtain a 1-horse power during an hour, it is easy to perceive that the management of the substance is not only possible, but also, from the point of view of its condensation under a weight and volume deduced from the motive power, that it leaves compressed air and many other kinds of forces frequently recommended far behind it.

The production of power by ammonia is less costly than steam, especially when steam is employed in the excellent machines of modern construction. But it is easy to store up ammonia, and transform it into an inert mass, transportable to places where it would be impossible to generate steam, and always ready, after having slumbered many long hours, to wake up instantly, and surrender all the force it has stored up.

For example, an omnibus drawn by *ammoniacal horses* would require, for an hour's journey, only 44 lbs. of ammonia and 132 lbs. of cold water. With this supply, easily renewable at each journey, we should have a simple manageable motor, discharging neither smoke nor steam, instantly producing its power, whatever be the time of stopping and duration, the re-generation of which costs less; thus procuring an economy of at least 75 per cent. over the employment of horses, at the same time giving to the public the largest and most economical means of transport. Ammonia omnibuses and other vehicles will, perhaps, some day travel on railways as a means of access to elevated stations; or as an agent of circulation through tunnels, where smoke would not be tolerated; or in bye-roads, in mines, or steam ships and boats, and especially in small factories, requiring a simple economic motor ready night and day.

Mr. Goldsworthy Gurney, in his evidence before a Committee of the House of Commons, in 1831, on locomotive carriages on turnpike roads, stated that he had made experiments with ammonia, and he thought that this substance might replace steam, when the apparatus was sufficiently improved as to admit of its general employment. A Mr. Mont Storm, of New York, has patented an ammonia engine, and in France M. Delaporte and M. Van Waeyenberch have taken out patents for machines of this kind.



AMMONIA ENGINE.

M. Delaporte's patent is dated 31st October, 1839. He takes a solution of ammonia in water, and puts it into the *desaturator*, A, which consists of a metal vessel of cylindrical or any other form, mounted over a furnace, S, which has a fire at *p*, and its flues at o and o.

The solution of ammonia is heated in this vessel to a temperature sufficient to expel the gas, and give it the pressure we desire to obtain, when the tap, R, is opened: the gas immediately rushes through the pipes, B, into the distribution box, C, of the motor cylinder, Q, and by means of the valve, *x*, it passes alternately above and below the piston, D, which it thus sets in motion, which motion is transmitted by the rod, *t*, to the beam, B^1, which communicates it by the crank, B^2, to the crank, M, and consequently to the axle furnished with a fly wheel, V.

When the ammoniacal gas has exercised its expansive force upon the piston, D, it passes by the pipe, E, and arrives at the condenser, F; the pipe, E, passes through a vat filled with cold water, I, before reaching the condenser. The object of this arrangement is to condense, by contact with the sides, the vapour of water carried over by the ammoniacal gas. This vapour becoming liquid, absorbs a considerable quantity of gas, and is thus converted into ammoniacal solution.

If the water arising from the condensation of the vapour is not sufficient to absorb all the ammoniacal gas, cold water is injected through the cock, *g*. This water may be taken from the vat, T, from a well, a reservoir, or stream. The water injected into the condenser becomes saturated with ammonia, so that the liquid contained in the lower part of the condenser is, in fact, an ammoniacal solution, which is extracted from the condenser by the air-pump, H, and thrown into the reservoir, *k*, from which it is drawn by the feed-pump, *u*, through the pipe, U, and afterwards conveyed to the desaturator by the pipe, U^1.

Upon arriving at the desaturator, A, the solution again disengages its ammonia, which returns to the gaseous state, to work the engine again and again. If it happens that the solution is not sufficiently concentrated, a certain quantity of a saturated solution is added, or, preferably, a current of ammoniacal gas is passed into the reservoir, *k*, or into the desaturator.

As it may happen that a greater quantity of water may be conveyed into the desaturator than that carried in the state of vapour, it will soon become full. To avoid this inconvenience, it is only necessary to immerse the waste pipe, *y*, to the bottom of the desaturator, and to open the cock with which it is furnished, when the level of the water is too high.

The liquid that flows out in this case is water in nearly a pure state; the ammoniacal solution, being much lighter than the water, will remain on the surface of the liquid, *a*. On this account, the feeding-pipe, U^1, is immersed only a small depth into the liquid. The warm water flowing through the tube, *y*, passes through the envelope, L, surrounding the feed-pipe, U^1. The object of this arrangement is to warm the ammoniacal solution before it reaches the desaturator, and thus economise fuel. The extraction water may be conveyed out by the tube, *l*; in certain cases there will be an advantage in cooling it completely, and employing it for injecting the condenser. Engines employed to produce motive power by means of ammoniacal gas may be either high or low pressure, with or without expansion. The desaturator may be heated by steam or by any other source of heat. The engines may be fixed, locomotive, or marine.

Other properties of ammonia have of late been turned to important account in the arts; these will be described in a future number.

* Cold water dissolves nearly 800 times its own bulk of ammoniacal gas; and heat, at different temperatures, drives off the gas again, producing different degrees of pressure.

Appearances of Good and Diseased Meat.—Good meat is neither of a pale pinkish colour nor of a deep purple tint. The former is indicative of disease, and the latter is a sign that the animal has died from natural causes. Good meat has also a marbled appearance from the ramifications of little veins of intercellular fat; and the fat, especially of the internal organs, is hard and suety, and is never wet; whereas that of diseased meat is soft and watery, often like jelly or sodden parchment. Again, the touch or feel of healthy meat is firm and elastic, and it hardly moistens the fingers, whereas that of diseased meat is soft and wet; in fact, it is often so wet that serum runs from it, and then it is technically called wet. Good meat has but little odour, and this is not disagreeable; whereas diseased meat smells faint and cadaverous, and it often has the odour of medicine. This is best observed by cutting it and smelling the knife, or by pouring a little warm water upon it. Good meat will bear cooking without shrinking, and without losing very much in weight; but bad meat shrivels up, and it often boils to pieces. All these effects are due to the presence of a large proportion of serum in the meat, and to the relatively large amount of intercellular or gelatinous tissue; for the fat and true muscular substance are to a greater or less extent deficient. It is at all times best to guard against the possibility of injury by having meat well cooked. It should be so cooked that the very centre of the joint should be exposed for some time to the temperature of 212° Fahrenheit. The instructions of Liebig in this particular are hardly safe; for although a temperature below that of boiling water may coagulate albumen and develop the flavours of cooked meat, it may not ensure the destruction of dangerous parasites. It is therefore better to have the meat a little overcooked than otherwise.—*Dr. Letheby, Report on the Cattle Plague.*

IMPROVED METHOD OF ENGRAVING ON GLASS.

Very excellent results in glass-cutting are obtained by substituting fluoride of calcium dissolved in hydrochloric acid for hydrofluoric acid, as suggested by M. Texier du Motay. The aqueous solution of hydrofluoric acid produces a lustrous biting upon the glass, while gaseous hydrofluoric acid gives a flat, rough, and adherent surface. For diluted hydrofluoric acid forms both with the silicium of the metal in the glass, and with the silicium and the alkaline earth in the glass—double fluosilicates of lead in the liquid where they are produced; while gaseous hydrofluoric acid forms volatile fluoride of silicium and insoluble fluorides of calcium and lead in the medium where they are generated.

Be that as it may, the *mat* engraving produced by the reaction of gaseous hydrofluoric acid upon glass is a striated surface of unequal thickness; for the water engendered by this reaction, gradually acidified by the contact of gaseous hydrofluoric acid, accumulates in unequal drops; and, also, partially and unequally dissolves the fluorides of lead and calcium formed.

The production of *mat* engraving by the fumes of hydrofluoric acid being, therefore, on this account, mechanically impracticable, endeavour has been made to effect this kind of engraving practically; for in a bath where hydrofluoric acid is disengaged in a nascent state, on contact with the silicic acid of the glass, there will be no formation of fluorides of silicium, nor, consequently, of fluorides of lead and calcium.

To generate hydrofluoric acid in a nascent state, we have had recourse to the reaction which the aqueous solutions of acetic and hydrochloric acids exercise upon the fluorides and the hydrofluorates of the alkaline metals.

Experiment shows—*first*, that, if to 100 ounces (five pints) of water, for example, we add twenty-five ounces of hydrofluorate of fluoride of potassium, well crystallised, and twenty-five ounces of commercial hydrochloric acid, we obtain a bath in which the glass becomes "ground" very rapidly, but the surface of which is neither very thick nor regular. *Secondly*, that to render the fluorides of lead or of calcium insoluble, or nearly so, in the above bath, and endeavouring to obtain thick and uniform "ground" surfaces, sulphate of potassa must be added to this bath till the liquid is saturated. The quantity required is about twelve ounces. *Thirdly*, that the sulphate of ammonia, as well as the oxalate of potassa, and some chlorides greedy of water—such as chloride of zinc, for example—can replace the sulphate of potassa to render the fluorides of lead and calcium in the engraving bath insoluble.

This process will gradually supersede those involving the use of the wheel and hydrochloric acid, and thus secure the workman against many dangers to his health.

Co-operative Intelligence.

Lea and Holloway Co-operative Industrial Society (Limited), near Matlock, Derbyshire.—On Saturday, 3rd February, we held our annual tea meeting, to which over 200 persons sat down to a substantial meal, after which Mr. John Holme, of Leeds, delivered a very interesting and instructive address. He told us of the land of Canaan before us, which we might possess if faithful in our co-operative journey, and he would be willing to come and address us again when we had doubled our business and doubled our profits. The quarterly report read showed that the business of the quarter was very encouraging. Cash received for goods, £734 12s. 1½d.; dividend to members, 2s. in the pound; to non-members, 1s. We give cheques on all goods. I name this as some societies don't give cheques on flour, sugar, &c.

Tweedside Industrial Co-operative Society (Limited), Tweedmouth.—The committee "are highly gratified in being able to present the shareholders with so favourable a statement. Eighteen members have joined during the quarter, and six withdrawn; total number, 299. Our sales for the quarter amount to £1,848 14s. 4½d., showing an increase over the previous quarter's sales of £199 17s. 10d. The disposable balance amounts to £218 4s. 8d., which gives a bonus of 2s. in the pound on all purchases. Public trade, £64."

Over Darwen Industrial Co-operative Society.—The twentieth report of the society's accounts, for the quarter ending December 26, 1865, gives the following results:—"The cash received for goods sold during the quarter amounts to £8,142 19s. 0½d., and for the year £31,904 18s. 1d., being an increase of £1,672 5s. 3d. when compared with 1864. The members' contributions for the quarter amount to £897 0s. 7d., and the withdrawals to £375 17s. 4d., thereby increasing the capital of the society £521 3s. 3d. The profits for the quarter amount to £719 9s. 7½d., which, after depreciating fixed stock and building account to the amount of £27 10s. 8d., paying interest on capital, and other incidental expenses, will allow a dividend of 1s. 8d. per pound on members' purchases, and 1s. per pound on non-members' purchases at the stores during the quarter; and your committee recommend that £26 2s. be added to the dividend guarantee fund, and the remainder—£30 13s. 9½d—be placed to the reserve fund. The gross profits for the year amount to £2,517 13s. 11½d., which have been disposed of in the following manner—viz., £125 11s. 10d. for depreciation, £297 6s. 3½d. for interest, £71 0s. 1d. to the dividend guarantee fund, £58 11s. 6½d. to the reserve fund, £203 8s. 10½d. for dividend on non-members' purchases, and the remainder—£1,761 15s. 4d.—among the members in proportion to their purchases; or, taking the average number of members for the year at 850, will give an average profit of £2 1s. 5d. for each member. Your committee of management are most happy to report that, during the past quarter, they have succeeded in purchasing the most eligible freehold premises, situate in School Street, known by the name of 'The Old Church School,' on which to erect new central stores."

Dalton Co-operative Society (Limited).—The eighteenth quarterly report of the committee for the quarter ending December 15, 1865, says—"The amount of cash received for goods sold at the stores amounts to £2,251 4s. 7½d.—being an increase over the previous quarter of £321 4s. 5d. We have also to report an increase of twenty-six members during the quarter—number withdrawn, four. Total number of members, 357. After paying interest on all paid-up shares, at the rate of £5 per cent. per annum, there remains a profit of £215 12s. 2d., which enables us to declare a dividend of 2s. 2d. in the pound on members' purchases, and 1s. in the pound on non-members' purchases, and £19 7s. 5d. to the depreciation of the buildings."

Belmont Amicable Unity Society (Limited), High Street, Vauxhall.—The committee of management have much pleasure in submitting their twenty-second half-yearly report to their fellow-members, together with a statement annexed of the present position of the society, the net amount of profit available being £42 15s. 5¼d., as shown in the financial sheet, after making due provision for the usual half-yearly guaranteed interest on capital—viz., £4 9s.8d. Your committee have to congratulate you upon having so respectable a balance, looking to the very heavy expenses incurred during the past six months—*vide* new smokeless furnace and expenses, solicitor's bill of costs in the matter of the new premises, coupled with some other charges for repairs, &c., and the smallness of the society's returns in comparison with former years, though there has been a slight improvement in the last few months, and your committee having been well bought in for flour during the same period, has been mainly instrumental in bringing about this satisfactory state of things. During the past six months twelve shares have been repaid, two new ones issued, and one other partly subscribed for. The society consists now of 136 members, holding 155 shares. The secretary writes:—"We have been established twelve years, and have had up-hill work, and great difficulty in maintaining our ground against prejudice and want of support from those for whose benefit this society was established; but, alas! the apathy that exists in London with regard to the development of a movement calculated to do so much good. Happily not so in the north of England, where its principles seem to be properly understood and appreciated. We are now removing to a thickly-populated neighbourhood—Spring Place, Wandsworth Road."

The London Association for the Promotion of Co-operation.—We have received the following letter:—"Permit me, through your columns, to inform your correspondent 'Co-operator' that a few co-operators (who, like himself and friends, have been members of societies that have not succeeded), with the assistance of the council of the London Association for the Promotion of Co-operation, meet every Tuesday evening, at half-past eight o'clock, at the office of the above-named association, No. 9, Bell Yard, Doctor's Commons, E.C., for the purpose of forming a Co-operative Society, upon an improved plan, in the City, and they would be glad of the assistance of your correspondent and his friends at their meetings to promote the formation of the society. Hoping, Sir, that the Working Man will go on and prosper, I am yours respectfully, James T. Judd, Assistant Secretary, London Association for the Promotion of Co-operation."

Brixton Co-operative Industrial Provident Society (Limited), 1, 2, and 3, Lyham Terrace, Lyham Road, Brixton, S. Branch Stores: Holland Street, North Brixton, and Wells Lane, Streatham.—The report for the quarter ending 28th December, 1865, says—"It is very gratifying to your committee to have it in their power to present you with such a report as the present. Our fifteenth quarter shows a continued increase of business, being £516 7s. 6¾d. over the previous quarter, and £980 3s. 5¾d. over the corresponding quarter of last year. Your committee have the pleasure to inform you that the new stores at Streatham are nearly completed, and will be opened some time in the course of the present quarter, when they hope that the accommodation provided for our friends in that neighbourhood will prove adequate to their requirements, and that they will accordingly show their appreciation of the labours of the committee by endeavouring to increase their numbers, and consequently their trade. Your committee avail themselves of this opportunity of informing the members generally that a new branch store is about to be opened at Balham, where they have no doubt that affairs will prosper in the same ratio they have done at our other branch stores. Your committee have also made arrangements for opening a butcher's shop at 4, Lyham Terrace, Brixton, where they hope to supply all our members who can make it convenient to come so far, with beef, mutton, pork, &c., of the best quality only, at reasonable prices. The profit accruing from our last quarter's business is £637 4s. 7d. The number of members at the commencement of the quarter was 734. Thirty-three have withdrawn and sixty-four have joined during the quarter, leaving 765 on the books of the society on the 31st December, 1865." A tea-meeting and entertainment was held at the Immanuel Church School-room, on Thursday evening, the 15th instant, to celebrate the opening of the new store at Streatham.

The Daisyfield Industrial and Co-operative Society commenced in February, 1861, and has consequently existed close upon five years. A few industrious and thoughtful working men having heard of the benefits conferred upon the members of many Co-operative Societies in the country (the foremost of which stood the celebrated Pioneers of Rochdale), resolved to form a society of that description. From the 4th to the 19th of February, 1861, there were twenty-eight members enrolled, with a capital of £55 in business. For the first quarter the business was done without a daily shopman, the committee serving purchasers at nights; and at the end of the first quarter, a profit was cleared of £32 14s. 7d., which greatly encouraged the members. For some time after this, the society continued to improve, until a dark cloud appeared, which threw a sad gloom upon the hopes and prospects of the members, and which threatened destruction to this and other kindred societies—namely, the breaking out of the American War—which brought upon Lancashire, through a cotton famine, the most distressing times. This not only retarded the society's progress, but many of its members were unavoidably thrown out of employment, and obliged to withdraw their investments. Though this great distress fell upon the operatives by no fault of their own, yet they cannot but remember with gratitude that many gentlemen nobly devoted their time and means in order to relieve them, one of whom greatly distinguished himself by his untiring exertions on their behalf. The gentleman alluded to has honoured this society by kindly consenting to preside over this meeting—namely, Mr. Richard Beaty. Fortunately for the existence of this society, there were a few hopeful and determined members, who resolved to stand by it, and steer it through the panic. As may be expected, in consequence of the commercial depression, our society was attended with but indifferent success, until the beginning of 1864, when it began to make some progress. At this time the number of members was sixty-one, and during the year 1864, increased to 100; and the business done in this year exceeded the business of 1863 by £918. This improvement naturally raised the hopes of the committee that the society had weathered the brunt of the storm, and was about to extend its usefulness and benefits to the people in the district. In 1864, the officers and some of the members began to purchase and patronise the *Co-Operator*, from whose pages we have gathered valuable instruction and encouragement. The editor of this useful journal (Mr. Henry Pitman) is a gentleman who has devoted a great number of years in advocating the principles of Co-operation amongst the people, and whose name is familiar and highly honoured in almost all the Co-operative associations throughout the country. In 1865 our members increased to 168, having by solicitation opened a branch store at Green Bank, which promises fair to be successful. The business done in this year was £4,042, being £1,378 in advance of 1864, and an increase of capital of more than £200. Since the commencement of this year, the share capital has increased £60, and we have entered twenty new members, which make our present number of members 188. Many of our members will testify that they have much occasion to rejoice in having entered this society, by reason of being served with good provisions, good weight, and having handed to them, from time to time, considerable sums of money in dividends, arising from the profits. Many of our members have entered the society, merely by paying 1s. 6d. each for entrance, and from the allowance on their purchases, have, in a short time, got several shares of £1 each to their credit in the books.

Co-operative Meat Stores.—We have received the following letters on the subject:—"Gentlemen,—Your well-known proclivities for schemes tending to elevate morally and socially the toiling millions of our highly-favoured land is world-wide. Another evidence in proof is given by the publication of the Working Man, which I hope will meet with the support it deserves from the classes whose interests are advocated. To direct the thinking masses, and guide their thoughts to a practical issue, is evidently the object and aim of your new and welcome serial. Allow me to point out an error in your excellent article on dear meat. You say it is wonderful there are no Co-operative meat companies. In Leeds and neighbourhood there are several; two, I believe, selling their best joints at 6d. per pound. Another commenced about a month ago, with every prospect of success, and a large dividend for the shareholders. It opened its shop in the centre of Leeds—part of an old inn that has lost its licence for bad conduct; and instead of rolling out bawling and noisy, as formerly, poor men and their tidy wives are seen making their purchases of sub-

stantial food, and retire in peace. The best joints in beef, mutton, and veal are sold at 8d. per lb. Already the premises are too small, and the demand greatly in excess of the supply. From the little knowledge I have of the above takings, a reduction of 1d. per lb. might and ought to be made, still leaving a very satisfactory dividend. As another Co-operative company is in course of formation, they are desirous of adopting the most improved method in killing and dressing. Would you be kind enough to inform us where we can learn the system that has such high claims to our consideration? Apologising for my long letter, and wishing you success, I am, yours respectfully, A Beef-Eater."—Upper Wortley, near Leeds, 12th February, 1866.—Gentlemen,—I have read your article on 'The Meat Question,' and wish to mention a fact or two. On the 15th of December, 1865, about forty working men living in Wortley agreed to purchase a bullock, and ascertain at what price good well-fed meat could be sold at, and leave a fair, reasonable profit. A committee was appointed; the bullock killed; its weight ascertained. The retail price per pound for best joints was fixed at 7½d., and inferior joints at corresponding prices. The result has been that the forty original members have had a bonus of 7s. per share; the butchers in the neighbourhood been obliged to reduce their meat from 9d. to 7½d. per lb., thus benefiting the public. The society is extending its operations, killing three beasts and three sheep weekly where it only killed one. The shares were 21s. at first, but are now reduced to 10s., and we admit all comers who promise to be consumers. I feel very curious to know how we may, by a superior mode of slaughtering, save the animals pain, add twenty per cent. in weight of saleable meat, and add to its nutriment. We are in a position to make the experiment. We go on the ready-money system; sell to whoever comes; make no distinction in selling between members and non-members; and as all members are consumers, we are pretty sure of selling up, if we buy with any judgment. If any new mode offended stray customers, provided members generally were benefited, we could afford to let them go. Naturally we wish to know more about this new mode of killing, and shall be glad to hear how this knowledge can be obtained."

Things Talked About.

One of the very first subjects discussed in the New Parliament, and which, next to the terrible Cattle Plague, Government appears to consider of foremost interest, is the best mode of providing dwellings for the labouring classes displaced by railway and metropolitan improvements, and otherwise, for reasons sadly notorious, very much in want of healthful, convenient, and cheap dwellings. The time-honoured maxim, *Salus populi suprema lex* ("The health of the people is the highest law"), has hitherto been more talked about than acted on by English statesmen. Now, however, ministers are really girding themselves up for the consideration of the question. Mr. Childers, the Under-Secretary of State for the Home Department, has introduced a bill, which has passed the first reading, for the purpose of enabling the Public Works Loan Commissioners to make advances towards the erection of dwellings for the labouring classes in populous places. There already exist Acts of Parliament conferring somewhat similar powers, but hitherto they have, from various causes, remained nearly a dead letter. The new bill proposes to enable minor local authorities in all parishes, public companies, and private persons to obtain advances at not less than four per cent., payable by instalments, and according to the same conditions as the present loans for public works. Of course there must be inspection of the plans for the proposed buildings, to ensure their suitability. The measure appears likely to receive almost unanimous support in the House; and when we read in Mr. Bazalgette's report to the Metropolitan Board of Works that the railway bills of the present session propose to destroy something like 16,000 houses, the necessity of immediate legislation must be apparent.

Meanwhile, that great public benefactor, Mr. Peabody, while furnishing the money on the most magnificent scale, is also showing how it may most wisely be expended. He sees plainly that enormous blocks of buildings divided into flats is not all that is required. Small houses out of town—suburban villages, in fact—with provision for easy access, are vital necessities. The railway companies have done most to create the difficulty, for their own profit; they should be bound to do their utmost to alleviate it. Mr. Peabody, in the letter in which he places £100,000 more at the disposal of the trustees, makes some wise suggestions. He desires that sites may be obtained within a radius of ten miles from the Royal Exchange, for the erection of "comfortable and convenient houses;" and "as dwellings in such sites may in some instances be remote from schools and other facilities for instruction, the trustees shall be at liberty in such cases, should they consider it needful, to set apart space adjacent to the building, and suitable for school-houses for the children of the families holding tenements. But such schools must be so organised as carefully to exclude sectarian influences, and so conducted as to avoid denominational jealousy." The want of such schools is severely felt by the occupants of Mr. Peabody's buildings and other similar edifices in London. He also impresses the necessity of making arrangements with railway companies for cheap and convenient trains. If all liberal donors had been as wise in their generation as Mr. Peabody is in his, we should have less of the perversion of the intentions of the founders of ancient trusts.

The London parishes, too, are moving in the matter; but with no very determined aim. Representatives of various boards of guardians have presented a memorial to the Hon. C. P. Villiers, President of the Poor Law Board, lamenting the wretched state of the habitations of the poor, but proposing no clear plan for the amelioration of their condition. The truth is, that parochial suggestions must be received with caution. There is a great tendency to desire the removal of the poor from crowded districts, with a view to lessening the local rates, by shifting the burden to another parish. The difficulty must be dealt with on broad principles, and it would seem that a measure for equalisation of the poor rate must follow any comprehensive scheme for improving the dwellings of the poorer labouring classes.

While on this subject, we may just mention that, at the meeting of the Improved Industrial Dwellings Company (Alderman Waterlow's), a dividend at the rate of five per cent. per annum was declared, which shows that the providing of good house accommodation is a tolerably remunerative investment. In fact, just now, Government, private benevolence, capitalists, and working men themselves (by means of an adaptation of building society machinery), are in the field, and something good ought to result. The two monster edifices in the Metropolitan Market, which never yet have been applied to any useful purpose, have been at length let on lease for twenty-one years to a society, which intends to convert them into dwellings for the labouring classes.

The Postmaster-General tells us, in his annual report on Post-Office Savings Banks, that, at the close of the year ending March 31, 1865, there were 524,340 depositors, of whom 140,518 belonged strictly to the working classes. Nearly £6,000,000 represented the amount of deposits. On the whole, it seems reasonable to expect that the annual increase in the business of Post-Office Savings Banks will for some time be from 130,000 to 140,000 in the number of depositors, and from £1,400,000 to £1,500,000 in the capital. Great is the power of the pence! With such an amount invested on Government security, and such a probability of increase, the working classes have indeed "a stake in the country."

And the working class feel that they have; and an association of working men has just been formed, comprising amongst its members a large number of the representative and leading men of the London trades and friendly societies, and other working-class organisations, with the immediate object of bringing the united influence of the working men of London to bear upon the Government for the purpose of obtaining the insertion of a clause in the forthcoming Reform Bill, conferring the franchise upon all adult male lodgers paying a certain rental.

We see that a measure is promised by Government having reference to the preservation of open spaces. We shall carefully watch its provisions. A public meeting has been held at the Beaumont Institution, Mile End. Our friends in the East are determined to do their best to prevent further invasion of Epping Forest, Wanstead Flats, and other open places, where they have hitherto resorted for a breath of pure air, and a glimpse of rural scenery.

Housekeepers of moderate means may congratulate themselves that the ready-money system, on which they usually act, is a real saving. We hear of a tradesman who has two shops in the provision trade, one at the East End, and the other at the West End. Credit is generally taken by the customers of the West End house, who are charged twenty-five per cent. extra profit for all goods booked to a six months' account, or fifty per cent. per annum more than the humbler East End customers.

Some few months since a workman, named Henry Knell, employed at the carriage department of the Royal Arsenal, Woolwich, composed and published a work entitled "Chips from the Block," being essays upon questions connected with social science. Her Majesty, having seen a copy of the work, forwarded to the author, through Sir Charles Phipps, a cheque for £10, accompanied by a letter expressive of her approbation of the praiseworthy manner in which the author had occupied his spare time. Mr. Knell has just brought out another work, being a "Guide to Woolwich Arsenal," and containing interesting details of the several departments of that establishment. A copy having been forwarded by the author to the Queen, she through Sir Charles Phipps acknowledged the receipt of the same, and expressed her entire satisfaction with the contents of the work.

A committee of the Council of the Society of Arts has been appointed, to inquire into the state of English and foreign law respecting trade marks. The subject of a proper registration of such marks will be introduced at the next meeting of the Associated Chambers of Commerce, and steps will be taken to introduce a Bill into Parliament.

General Information.

CLUBS AND INSTITUTES.

St. James's and Soho Working Men's Club and Institute, Rose Street, Crown Street, Soho.—A general meeting of the members was held on Thursday evening, the 8th inst., to hear the secretary's report, adopt rules for the government of the club, and appoint officers for the ensuing half year. Mr. Matthews occupied the chair. The report, showing a rapid increase of members and a healthy financial position, having been read, the consideration of the rules, as recommended by the retiring committee, was proceeded with, and after a quiet but earnest discussion as to their merits, were adopted, with but slight alterations. The law prohibiting the introduction of beer and spirituous liquors was allowed to pass without a dissentient voice. The election of officers followed: for treasurer, H. Hoare, Esq., Jun.; Mr. Matthews re-elected as president; Mr. Shipley, secretary; many of the retiring committee re-elected. A hearty vote of thanks to the chairman and past officers closed the proceedings of a meeting, whose numbers, and their close attention to the affairs of the club, amply proved the necessity of such an institution, and the great probability of its becoming eminently successful. The rent of its present commodious premises and concert hall having been kindly guaranteed by Mr. Henry Hoare, Jun., and there being a large number of working men in the neighbourhood, the energetic efforts of the committee and other members seem to be at length rewarded. For many months they had to struggle with the great hindrance of very inadequate premises, so that their numbers fell to about twenty. These, however, stuck bravely together, and have triumphed over their numerous difficulties. They number now 130 members, are paying their way, and have every reason to hope for a long career of increasing benefit to the neighbourhood.

Camden Town Working Men's Club and Institute.—The annual public meeting of this very useful and prosperous club was held on Tuesday evening, the 13th inst. Thomas Chambers, Esq., M.P. (Common Serjeant), was announced to preside; but, being detained by another meeting in Exeter Hall, the Rev. H. Solly was requested to occupy the chair till he arrived. Addresses were delivered by that gentleman, M. A. Garvey, Esq., LL.B., the Rev. J. C. Harrison (Independent Minister), and by several members of the committee. Mr. Chambers, on his entrance, was greeted with much applause; and, having given an excellent address, in the course of which he announced himself as one of Mr. Solly's converts, on the occasion of meeting him at the recent Social Science gathering in Sheffield, he proceeded to distribute several valuable prizes awarded to students in the French class. But the chief event of the evening was the presentation by Mr. Chambers, on behalf of the members of the club, of a beautiful writing-desk to Mr. Porter, whose indefatigable exertions and fine musical taste, ably and generously seconded by many fellow-workers, have long made the weekly entertainments of the Camden Town Working Men's Club so popular throughout the district. Mr. Porter was received with vehement and prolonged applause, and gracefully acknowledged the gift. Very hearty votes of thanks to Mr. Chambers and the visitors, especially to Mr. Borrow, the honorary secretary, concluded the evening's proceedings.

Opening of a Working Men's Club at Gateshead-on-Tyne.—The first Working Men's Club at this town was opened on Monday, February 5th. Previous to the inauguration, admission was given to ticket-holders to inspect the premises, and to view a number of paintings, models, drawings, microscopes, and other objects of interest that had been lent or presented to the club. An excellent quartette party, during the exhibition, also gave some musical selections. After the *conversazione*, the president of the club, Mr. H. Tennant, took the chair. On the platform were several of the principal townsmen, among whom were the representative of the borough, Sir W. Hutt, and Lady Hutt. Sir W. Hutt delivered the inaugural address. To give others an opportunity of seeing the exhibition, and that the establishment of the club might be fully known in the district, similar meetings were held on the 6th and 7th inst. On the former evening the Mayor presided. Two gentlemen gave an interesting description of some of the uses of electricity. During the latter evening Mr. T. P. Barkas lectured on the objects of interest at the exhibition. Each of these lectures was preceded by a *conversazione*, as on the first evening.

Ipswich Working Men's College.—The fourth annual *soirée* in connection with the Working Men's College has taken place at the Corn Exchange; and the large attendance of members of the college and their friends, was a conclusive proof that, so far from this *réunion* having declined in popularity, it becomes better known and more appreciated every year. The arrangements were such as must have given universal satisfaction, and the probable consequence will be, that another year, if the council of the college intend to afford accommodation for all who will desire to attend, they will have to erect a building for the special purpose. The first part of the proceedings consisted of a tea, of which some 600 ladies and gentlemen partook. At eight o'clock the chair was taken by the Mayor (E. Goddard, Esq.), and the entertainment, which consisted

of vocal and instrumental music, readings, and recitations, commenced. The programme was well arranged, and passed off very successfully. Dr. Christian, the principal of the college, who was warmly received, said he thanked the public for the support they had given on that and on every occasion to their attempts to do good to classes who deserved to be supported. He was happy to say, with reference to that meeting, that he believed the result of it would be that the college library would benefit by it to the amount of about £20. On the following evening a treat was given at the Corn Exchange to the children belonging to the Ipswich Industrial Ragged School, the Tanners' Lane School, and the Union School, who will long have a grateful recollection of the kindness they met with from the Working Men's College. At five o'clock the children, with the mothers, &c., of some, sat down to a plentiful tea, which they thoroughly enjoyed, and at half-past six the presents, which had previously been hanging from two large Christmas trees placed in the centre of the hall, were distributed among the young guests, greatly to their delight. Later in the evening an entertainment, similar in character to that of the previous night, was given, and passed off successfully.

SOUTHWARK WORKING MEN'S CLUB AND INSTITUTE, Broadwall, Stamford Street.—The annual meeting of this club was held in the large club-room on Monday. Stephen S. Tayler, Esq., was in the chair, and the meeting was addressed by the Rev. H. Solly, and Mr. Symonds, the secretary. The latter gentleman gave a very interesting report of the proceedings of the club. The number of members at present on the books is about 130; 70 or 80 more would make the club self-supporting, and surely there need be no difficulty in getting this additional number of men out of that thickly-peopled district. The amusements are chess, draughts, bagatelle, quoits, &c. About thirty concerts have been held on Saturdays. There is a rowing-club in the summer which brought numerous members, but which last year somewhat disappointed expectation; it is hoped, however, that next summer, with good management, it will be as successful as it deserves to be. There are classes for elocution, chess, drawing, and shorthand. The age for admission as members is 21, but youths of 18 may be received as *associates*, by a card signed by two members of the club. At one time too many youths were admitted, and they were found to be very troublesome; and the excess of their numbers over the number of older members nearly ruined the club. This club is much indebted to their generous and excellent president, Mr. Tayler, Peckham Rye. The secretary states that the presence of the president has a wonderful effect in keeping good order and transacting business. He also complains that, in the absence of the chairman, the members do not observe business rules, and proposes that the Working Men's Club and Institute Union should print a large bill, to be hung up in each committee room, giving information respecting the usual rules observed in public meetings, and showing the duties of chairman, secretary, and vice-chairman. The club are in debt to Mr. Tayler about £170, on the building repairs and fittings, and in order to pay this they are anxious to increase the number of members. This should be easy in such a populous district, especially when we consider that it is *the only club* on the Surrey side of the river.

Correspondence.

*** *We shall be happy to receive any information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* WORKING MAN, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

THE LEICESTER WORKING MEN'S CLUB.

To the Editor of the WORKING MAN.

SIR,—The paragraph in your impression of February 3, under the head of the "Leicester Working Men's Club and Institute," contains statements which are not altogether correct. The facts of the case are these:—A large majority of the committee were in favour of admitting malt liquor, subject to such restriction that might be deemed advisable; as also were several gentlemen not upon the committee, who had consented to become trustees. But desirous of consulting the wishes of those whose names were not on the books as intending members, a circular was issued, addressed to members and intending members requesting them to attend a meeting at the Town Hall, the business of which you will ascertain by a perusal of the circular, a copy of which I enclose. The committee, trusting to the honour of the Leicester working men, took no means to ascertain at the doors whether persons who entered were members or not; the consequence was, that the teetotalers—who to their honour are ever zealous on their *one idea*—assembled in large numbers; amongst them, in the body of the hall, practised speakers on that point, who were not members, and who had not expressed their intention to become members, but who came for the sole purpose of excluding beer, which they accomplished by a large majority. The chairman, being informed by the secretary that a great number of those present had not given their names, appealed to their honour to come forward and enrol themselves. Eighteen responded to this invitation, giving their names only. Out of this number the secretary has only seen one since, although it has been published in the local papers that cards of membership may be obtained of the secretary. That one has been added to the provisional committee, and he declares himself in favour of the admission of beer for those who may require it. During the time the names were being enrolled, a member of the club protested to the chairman against the decision of that meeting. The names of the committee of management carried at that meeting were the same, with few exceptions, as the provisional committee, and the names added have since been received by the provisional committee, who had power to add to their number. After this decision, the gentlemen who had promised to become trustees, declined, and a fortnight passed in endeavouring to find trustees—apart from the teetotalers—but failed. One of the most influential gentlemen in the town amongst the teetotalers gave his name, on the understanding that there was to be no beer; but the committee did not think it advisable to proceed on so slender a basis, and with such little chance of success. They did not wish to give the club the character of being allied to any party—not disparaging in the least the efforts of the teetotalers—but wishing to give the club a wider range, that would embrace all working men, to offer them the means of recreation and enjoyment, with no temptation to excess; to enable them to get a glass of ale, without the inducement of taking two for the good of the house; to enable them to see in their club examples of moderation, and to have means of enjoyment where books, lectures, discussions, readings, and music would do much to improve their habits and condition. The club, therefore, came to a dead lock. The secretary, and other active members of the committee, canvassed a great number of parties who had given their names, and found that but very few were present at that meeting; and ascertained in the workshops that many who had until then withheld their names, would join the club if established upon a broader principle. The committee, therefore, at a meeting in the mayor's parlour, Rev. E. J. Allen in the chair, set aside the decision of the general meeting. For the reasons above stated, and at a subsequent meeting, the same gentleman in the chair, January 4, 1866, it was carried, with one dissentient (that gentleman having since retired), that malt liquor and light wines should be admitted, subject to such restrictions that shall be thought advisable. Since that time the committee have met with numerous obstacles in getting premises suitable for them; they are, however, very happy to state that they have at length succeeded.

A circular is in preparation, addressed to the upper classes, asking their support to raise funds to furnish the premises. The secretary has received promises of £5 each from a number of gentlemen to head the list, and the committee feel confident they shall raise the necessary funds in a very short time. Active steps are now being taken by the committee to engage a resident manager, and to furnish the premises, and expect to be able to announce very soon the day of opening. JOHN COATON,

53, *Luxton Street, Leicester.* *Secretary.*
February 13, 1866.

THE PARKS OF NATURE.

To the Editor of the WORKING MAN.

SIR,—Your article in No. 7, on the "Parks of Nature," prompts me to call your attention to the scandalous enclosure of Chigwell Common, now in course of proceeding, but which I have for the past several years stayed from enclosure by proceedings against the Lords of Manors, and notices to the Enclosure Commissioners, which *to this time* has had the effect of stopping their attempt, in order that I might see what the Government purposed doing, which it appears we shall now soon know.

I have brought two actions, which the Lord of the Manor is defending, in reference to 100 acres filched from our Common, and have ready notice of action against the Enclosure Commissioners; so that, if Mr. Cowper does not put a stop to them, I shall, and cause a delay of their award.

I have worked hard at this now ten years, and may justly claim to be the pioneer of the new enclosure movement; and I recently caused a memorial to be placed at a Cabinet Council by Sir George Grey before the Queen, praying that the still unallotted portion of Chigwell and Lambourn Commons should be appropriated as a People's Park, and called "The Royal Albert Forestal Park," for which it is *now prepared by Nature;* and as I got 50 acres allowed for a recreation ground of the forest in 1862, and the Enclosure Commissioners have *about £4,000 in hand*, the expense would be trifling.

If you would give me a helping hand in your Journal—for I am working alone, and have spent several hundred pounds in the matter—an article in your excellent publication at this particular moment would assist my endeavour.

Apologising for troubling you with this, I remain, yours obediently, G. SHILLIBEER.

Grove House, Chigwell Row, Essex, N.E.,
14th February, 1866.

TRADES UNIONS.

To the Editor of the WORKING MAN.

SIR,—I, like a "Trades Unionist," who recently addressed a letter to you, do not agree with your article on Trades Unions, and I consider the conclusions come to in that article are not correct. You say the "trade feeling" is all that can be got from trades unions, and that the workman should aim to be a thinker and an artist. Well, to my mind, the working artisans of England are both thinkers and artists. I need only instance the industrial exhibitions of the last few years to prove that they can both conceive and execute. But, sir, you seem to think that trades unions encourage strikes; while the fact is the union is to obtain what is wanted without force—to make propositions in a fair and honourable manner, which, coming from a united body, are more likely to be heard than when made by single individuals. If workmen had to be dealt with singly the rate of wages would be lower, and the clever, intelligent workman would have less chance to rise in the social scale.

I would just instance the late iron lock-out, to show that the workmen are more moderate, though unionists, than they get credit for. The masters proposed to lower their workmen's prices 10 per cent. The men considered the matter over, and said they would accept a reduction of 5 per cent. This the masters would not agree to, but the men said, "We have met you half-way; that is fair to both parties." Well, then, the men, being united, were determined to accept no other terms; they were assisted by their co-workers in other parts of England, and what was the result? The masters used every possible means to coerce their men, who, as a last resource, adopted emigration. At last the masters, after causing great privation, offered their men the very terms proposed by the workmen in the first instance—namely, 5 per cent. reduction.

I am also prepared to prove that there are nobler ideas among unionists than the trade feeling: the union I belong to allows sick-relief and funeral money, contributes to hospitals, gives relief to members out of work and those searching for employment, and aids them to get work through its secretaries, by that means keeping honest and hardworking men independent of parochial relief, and lightening the poor rates.

In conclusion, I wish every success to the WORKING MAN, and trust that it may continue in the same reasonable and moderate tone to discuss this important question,

I remain, yours truly,
Leeds, Feb. 13th, 1866. ANOTHER UNIONIST.

SCHOOLS OF ART.

To the Editor of the WORKING MAN.

SIR,—I see by the WORKING MAN that 16,000 odd is the number of all the scholars in the art schools put together, and the result is called "most miserable;" but can you wonder at it when the head school (and a magnificent one I own it is) is placed miles out of the way, and the branches charge 2s. entrance fee and 2s. a month, besides making the scholar find materials to work with? What working man can afford 6s. or 7s. outlay for one or perhaps two of his family for an accomplishment, however necessary it may be, in any business they may be destined to learn? I am afraid the "circumlocution office" have as usual tried "how not to do it," and laid out the largest amount of money to produce the smallest amount of good. The schools are not near full, and those who do go are of a class that can afford to lose more time than the working man, however anxious he may be to improve himself. If the hours were from 8 to 10 instead of 7 to 9, it would be better, as every workman does not leave off at 6 o'clock—and no entrance fee would be better still. I do hope that gentlemen of position and influence will lend their assistance to establish another museum within a more reasonable distance than that at Kensington, which one has to make holiday to go to, costing time and money, which we can ill afford.—Yours very respectfully, A CARVER.

TO CORRESPONDENTS.

G. N. (Glasgow).—We have already made arrangements for supplying in our columns a series of practical lessons in drawing.

T. H. (Dalton-in-Furness).—A member of a committee is not bound to vote either for or against a motion put to the meeting. When the chairman puts a motion, he first desires "All who are of opinion that this motion shall be agreed to, signify the same in the usual way;" and then puts the question, "On the contrary." How else can it possibly be decided whether the motion is carried or not? An amendment not having been proposed has nothing to do with it.

H. B. THORNE.—To make rose-pink, digest the Brazil wood, ground to powder, in cold water, in which one ounce of tartrate of potash to the pint is dissolved; precipitate by a solution of alum. Collect the precipitate on a filter, wash with cold water, and dry. The alum must be quite free from iron. The colouring matter of the wood may also be precipitated by a solution of chloride of antimony. Take 5 gallons of solution of chloride of antimony, strength 80 degrees Twaddel's hydrometer, and add 100 gallons of a strong decoction of Brazil wood; stir carefully together, and leave to settle for a few hours, then throw on a filter. When the liquid has passed through the filter, wash the residue with 20 quarts of water, and repeat this washing a second time. When the precipitate is drained, the pink is ready, and may be dried, or employed in the moist state. The colour may be varied from crimson to scarlet, by varying the proportions of wood and chloride of antimony.

H. T.—You can buy benzole and bisulphide of carbon at manufacturing chemists, such as Button and Co.'s, Holborn Bars. Chlorine gas may be obtained in suitable apparatus by pouring sulphuric acid upon common salt; sulphate of soda is formed, and chlorine liberated.

W. C. (Cattle Plague).—Unless you possess more knowledge on the physiology and pathology of the subject than the most eminent scientific men living, it is not probable your proposal will be listened to. Where science fails, empiricism is hardly likely to succeed.

J. UPTON.—Flint glass possesses greater dispersive power than crown glass; this quality is due to the oxide of lead used in its manufacture.

T. AGNEW.—Cast iron may be silvered by employing excess of chloride of silver in a cyanide solution of that metal, and otherwise pursuing the usual battery process.

A MASON.—A mixture of hydraulic lime and soluble glass is the best cement for cracks and flaws in stone. The mixture forms a mortar, which must be used at once, as it sets immediately.

S. B. T.—Picric acid is prepared by treating carbonic acid with nitric acid.

Government of South Australia EMIGRATION DEPARTMENT.

FREE PASSAGES are granted to South Australia, in vessels chartered expressly by H.M. Emigration Commissioners, to PLOUGHMEN, farm servants, miners, masons, bricklayers, wheelwrights, blacksmiths, sawyers, carpenters, gardeners, grooms, collar and harness makers, country shoemakers, &c.

General Life and Fire ASSURANCE COMPANY,
62, KING WILLIAM STREET, LONDON, E.C.
CAPITAL, ONE MILLION.
Established 1837.

Entire freedom of the assured from responsibility and the *mutual* liabilities of partnership.

A Reversionary bonus, equivalent to from 30 to 60 per cent., according to the age of the assured, declared in 1863.

The Reserve Fund in hand is upwards of six times the amount of the annual life income.

THOMAS PRICE, Secretary.

Working Men's College.—BUILDING FUND.—Subscriptions are requested in order to allow the Proposed Buildings to be begun in the Spring. The College is self-supporting; but increase of numbers has made additional Rooms necessary. Estimated cost, £3,000. Already subscribed, £760, including £30 5s. from the PRINCE OF WALES, and £278 from the Principal and Teachers. See fuller statements in current numbers of *Cornhill* and *Macmillan's Magazine*. Subscriptions received at the College, 45, Great Ormond Street; the London and County Bank, Oxford Street; and by the Treasurer, R. B. Litchfield, Esq., 4, Hare Court, Temple.

Working Men's Club and INSTITUTE UNION.—President, Right Hon. Lord BROUGHAM. The continually-increasing extent of the operations of this Society, which has been of essential benefit to many thousands of Working Men and their Homes, renders a proportionate increase of its funds urgently necessary. The Council, therefore, confidently APPEAL to the Public to grant increased support to this truly useful movement. Contributions may be sent to the Treasurer, Henry Hoare, Esq., Jun. (Messrs. Hoare and Co., Fleet Street), or to the office, 150, Strand, where full information may be obtained.

HENRY SOLLY, Secretary.

Paris Exhibition, 1867.—All demands for SPACE from intending Exhibitors must be sent, marked "Paris Exhibition," to the Secretary, Science and Art Department, South Kensington Museum, London, W., on or before 28th February, when the lists will be made up.

NOTICE TO BUILDERS.
Office of Works, &c., 12, Whitehall Place,
Feb. 13, 1866.

The Commissioners of Her MAJESTY'S WORKS and PUBLIC BUILDINGS are prepared to RECEIVE TENDERS for the ORDINARY WORKS and REPAIRS to PUBLIC BUILDINGS, &c., in the London District. Printed Schedules, Specifications, Conditions of Contract, and form of Tender may be obtained at H.M. Office of Works, No. 12, Whitehall Place, London, on and after the 19th instant, between the hours of Eleven and One, upon payment of 10s. The Tenders are to be delivered at the Office of Works on or before Twelve o'clock at Noon on Monday, the 5th day of March next. The Commissioners do not bind themselves to accept the lowest or any Tender.

ALFRED AUSTIN, Secretary.

Working Engineer, &c., WANTED, at the St. Marylebone Workhouse, Northumberland Street, Marylebone Road. He must be a skilled workman, able to attend to the steam boiler and other apparatus in the laundry and washhouse, to do the smith's work about the building, to attend to the fire-engine, hose, and mains, and other duties under the orders of the Master. Wages 23s. per week.—Further particulars may be obtained on application to the Master, Mr. G. E. Douglas, at the Workhouse. Letters of application, stating age and previous occupation, accompanied by testimonials, to be forwarded to the Secretary on or before Saturday, the 24th instant, and candidates are required to be in attendance at the Board-room of the Workhouse on Monday, the 26th instant, at eleven o'clock in the forenoon.

By order, JOSEPH BEDFORD, Secretary.
Secretary's Office, St. Marylebone Workhouse,
Feb. 15, 1866.

University College, London.—SUMMER COURSE of CHEMISTRY (Theoretical and Practical, including the subjects of the Matriculation Examination of the University of London). Professor WILLIAMSON, F.R.S., assisted by Mr. C. H. Gill, F.C.S.

This course will consist of about forty lessons, commencing on WEDNESDAY, April 11, at 11 a.m.

Fee for the class, £4, including cost of materials and apparatus.

Feb. 8, 1866. AUG. DE MORGAN,
Dean of the Faculty of Arts;
CHAS. C. ATKINSON,
Secretary to the Council.

Albert Veterinary College (Limited), Queen's Road, Bayswater. Professor John Gamjee, Principal. Subscribers' fee, £2 2s.; Tradesman's, £1 1s. per annum.

Public Examination in ELEMENTARY DRAWING of the SECOND GRADE at SOUTH KENSINGTON.—PUBLIC EXAMINATIONS in DRAWING, conducted by the Science and Art Department, will be held on the 12th, 13th, and 14th of March, 1866. Candidates must assemble at 6.30 p.m. or 8 p.m., and the papers will be given out as follows:—

March 12—Freehand Drawing, 7 p.m.; Geometry, 8.30 p.m.
March 13—Model Drawing, 7 p.m.; Perspective, 8.30 p.m.
March 14—Mechanical Drawing, 7 p.m.

The Examinations will be of the second grade only, and will be open to male and female candidates above twelve years of age, who are not attending elementary day schools for the poor.

Persons who wish to be examined must apply, before March 3, to the Secretary of the Science and Art Department, South Kensington, stating their names and addresses, and the subjects in which they are prepared to be examined. Masters of private schools wishing to have several of their scholars examined, are required to furnish the number who will present themselves for examination in any of the above subjects of the second grade.

By order of the Committee of Council on Education.

HOULDER BROTHERS & CO.,
146, Leadenhall Street, London, E.C. [22

The Planet Permanent Building AND INVESTMENT SOCIETY, Established by Act of Parliament, July, 1848.

Annual Income exceeds £200,000. Offices, 39, CITY ROAD, FINSBURY SQUARE, LONDON, E.C. The SEVENTEENTH ANNUAL MEETING was held September 12th, 1865. The Directors reported a large Augmentation of Business, and an Accumulation of Profits, which allowed a Bonus of £10 per cent., making the Dividend for the past year £15 per cent. The sum of £12,505, the Balance of Profit, had been carried forward for future division. The Assets of the Society had been increased during the year by £106,981. The Directors confidently reaffirm that—first, as a mode of investment at once secure and profitable; secondly, in the easy terms to Borrowers, and the facilities afforded for their transactions; thirdly, in the Equitable Adjustment of Repayment and Interest; fourthly, in the mode of Redemption; and, lastly, in the moderate fixed Law and other Charges, this Society stands alone. Shares £50; Entrance Fee, 2s. 6d. per Share. Deposits to any amount—upon which no entrance fee is charged—may be made. Interest, £5 per cent., repayable on fourteen days' notice. Prospectuses and all further information may be had of EDMUND W. RICHARDSON, Secretary.

Offices—39, City Road, London, E.C. [5

PRICE TWOPENCE.

Upright Shoemaking. An ADDRESS TO WORKING SHOEMAKERS AND OTHERS ON THE EVILS OF THE "SEAT," AND THE ADVANTAGES OF THE "UPRIGHT BENCH;"

with a few Practical Hints to Persons interested in the Promotion of Industrial Schools and Reformatories. By J. SPARKES HALL. Sent for three stamps to any address.

London: J. SPARKES HALL, 308, Regent Street. [6

Coals, direct from the Collieries, supplied by the JOINT-STOCK COAL COMPANY (Limited).

—Best Wallsend, 24s. per ton; Adelaide ditto, 22s.; the Company's Silkstone, 22s. Hartley, Welsh Steam, Nuts, &c.—Chief Office, 49, Fleet Street, E.C. Coal Depôts: Great Northern Railway, King's Cross (22 Coal Department); Great Western Railway, Paddington; Regent's Wharf, West Ferry Road, Millwall; Durham Wharf, Willow Brook Road, Peckham.

FREDERICK AUGUSTUS NEW, Managing Director.

Coal.—Herbert Clarke.—

GREAT NORTHERN RAILWAY, King's Cross, N.—Best Lambton Wallsend, 24s.; Wallsend, 22s.; Silkstone Maine, 22s.; Cooper's Silkstone, 22s.; Double Diamond, 22s.; Black Shale, 22s.; Hard House, 21s.; Silkstone Seam, 20s.; Derby, 19s.; Barnsley, 19s.; Hard Steam, 18s.; Hartley's, 18s.; Nuts, 15s.; Small, 13s.; Coke, 15s.

Coal.—Rickett, Smith, and

CO.'S Selected Coal, 23s.; Best Wallsend, 24s.; R. S. and Co.'s Silkstone, 22s.; Old Silkstone, 21s.; Derby Bright, 19s.; Barnsley, 19s.; Hartley's, 18s.; Steam, 18s.; Nuts, 15s.; Small, 13s.; Coke, 15s. per Chaldron, Cash.—Great Northern Railway, King's Cross; and Great Eastern Railway, Bishopsgate.

Coals.—The London Guinea

COAL COMPANY supply their celebrated Wallsend Coals, to all parts of London, at 21s. per ton, for cash on delivery.—Address, the Managers, COLE and LEIGH, 57, Marylebone Road.

Four Fires for One Penny.—

The PATENT FIREWOOD can be obtained from any oilman or grocer in or near London, at 2s. per 100; packed for the country, 500 for 10s. Lights instantly. No paper required.—Works, 18, Wharf Road, City Road.

City of London Working CLASSES' INDUSTRIAL EXHIBITION.

INAUGURATION 6TH MARCH.

THE RIGHT HON. THE LORD MAYOR.

BENEDICT AND GRAND CHOIR.

Surplus funds to be appropriated to the establishment of a Free Public Library.

WILLIAM RAMSEY, *Hon. Sec.*
JOHN ROBERT WHOBLOW, *Secretary.*

Offices, 7, Racquet Court, Fleet Street. [1

Perpetual Investment and BUILDING SOCIETY,

37, NEW BRIDGE STREET, LONDON, E.C.

MONEY,

In large or small sums, ready to be advanced upon security of Freehold, Copyhold, and Leasehold Property, repayable either in one sum or by periodical instalments. The amount advanced since May, 1861, exceeds

HALF A MILLION STERLING.

Prospectus and Forms of Application may be had on application, or will be sent by post. Apply to

JOHN EDWARD TRESIDDER, Secretary. [23

The London Provident Institution, 2 and 3, Blomfield Street, Moorfields, E.C.

Established A.D. 1816. Savings Bank Certified under the Act of 1863. Open Daily. Office hours eleven to three. Saturday eleven to one and five to eight. Sums not exceeding £10 are paid to depositors, without previous notice, on Monday, Wednesday, and Friday. The rate of annual interest allowed to depositors is £3 per cent.

FRANCIS E. GREENAWAY, Secretary.

St. Marylebone Bank for SAVINGS, 76, Welbeck Street.

Savings Bank certified under the Act of 1863. Open daily from ten till three, and on Monday and Saturday evenings, from six till nine o'clock.

A MARVEL OF CHEAPNESS.

The Shilling Drawing Case,

Complete; containing Six Progressive Studies, after J. O. Harding, a Book of Whatman's Superfine Drawing Paper, Two Academy Drawing Pencils, and India-rubber. Post free for 14 stamps.—PACKER and GRIFFIN, 35, Poland Street, Oxford Street, W. Schools, the Trade, and Shippers supplied on advantageous terms. [3

Fry's Homœopathic Cocoa,

in Packets.—The purity, delicacy of flavour, and nutritious properties of this Cocoa, as well as the great facility with which it is made, have rendered it a standard article of general consumption. It is highly approved and strongly recommended by medical men, and is equally adapted for invalids and general consumers.—J. S. FRY and SONS, Bristol and London, are the only English Manufacturers of Cocoa who obtained the Prize Medal, 1862.

Picture Frames for the CHILDREN IN THE WOOD, given with the *Illustrated London News*.

Handsome gilt frames, glass, and back, 3s.; by the dozen, 2s. 6d. Maple and gilt, 5s.; by the dozen, 4s. Every description of Prints and Frames kept in stock. The Trade and Country Dealers supplied with maple and gilt Mouldings at the lowest prices. List of prices, 2 stamps, at GEORGE REES, 57, Drury Lane (near the Theatre). [24

National Institution for DISEASES OF THE SKIN, 10, Mitre Street, Aldgate.

Physician, Dr. Barr Meadows, 8, Hinde Street, W. Open on Monday and Thursday Evenings from Five till Eight, and on Wednesday and Saturday Evenings from Seven till Nine. Free letters are available for necessitous applicants. THOMAS ROBINSON, *Hon. Sec.* [25

Hyam and Co.'s Garments and PRICES.

—The new Prince of Wales and Prince Alfred Overcoats and Capes, 15s. 6d. to 42s.; Knickerbockers, Eton, Harrow, and Osborne Suits, 15s. 6d. to 45s.; Jackets, 8s. 6d. to 25s.; Trousers, 8s. 6d. to 15s. 6d.; Vests, 4s. 6d. to 7s. 6d.; Jackets and Vests alike, 15s. 6d. to 27s. 6d.

THE WORKSHOPS OF THE WORLD.

NEEDLE-MAKING AT REDDITCH.

Redditch, the Metropolis of Needle-making.

ONE hundred millions a week! One hundred millions of needles made in the Redditch needle district alone, each week in the year, and distributed over the world from Kamtschatka to New Zealand

At what date the manufacture was introduced into this place is uncertain—tradition says in Cromwell's time. However, one firm at least has existed from the year 1730; and during the last fifty years Redditch has been gradually growing in size, and the amount of its trade, until, from an insignificant village, it has become a thriving, busy town, leaving far behind in the race Studley, Alcester, and the adjacent needle districts, and making itself the chief emporium of needles for the whole world. It is beautifully situated, about twelve miles from Birmingham, upon the boundary line between Worcestershire and Warwickshire, but chiefly in the former county. Population, about 6,000.

The town possesses a handsome Protestant church, also one devoted to the Roman Catholics, and chapels in connection with the Wesleyan,

Independent, Methodist Free Church, and Primitive Methodist denominations. It has also a newspaper, a literary institute, a working-man's institute (the latter well conducted and supported), good national, Wesleyan, and private schools, &c.

Nor are these means of education without their legitimate effect upon the community. There is a great and visible change in the habits, deportment, and modes of speech of the artisans. Thirty years ago they were comparatively rude and uncultivated, and used an uncouth, broad, Worcestershire dialect, half unintelligible to strangers; but now all that is rapidly passing away. They are very neat and clean in appearance, as compared with the mechanics of other manufacturing towns, orderly in manner, and generally intelligent, whilst not a few evince powers of thought and intellect of no mean order.

We are indebted to the courtesy of Mr. Richard Turner, manufacturer, of Redditch, for the illustration of needle-making at the head of this article, and will now proceed to describe the different

PROCESSES OF MANUFACTURE.

The wire for needle-making is procured from Sheffield or Birmingham, in coils varying in size and weight with the different sizes of needles required. Each thickness, or "size," of wire is gauged with the utmost care, to ensure perfect uniformity, and a coil of medium size will produce from 40,000 to 50,000 needles. After being gauged, it is taken to be "cut and rubbed," the first of which processes is performed in a peculiar and somewhat laborious manner. A pair of very large shears are firmly fixed in an upright position against a beam of wood projecting from the wall, leaving one arm free. The workman, first of all, cuts the coil through; then, taking an end of the bundle in one hand, and a gauge of length in the other, places the wires between the blades of the shears, presses powerfully forwards with his body against the loose iron arm, and cuts off a quantity, each one exactly the length of *two* needles. These wires are, of course, curved in the same proportion as the coil; and, to remove this curvature, when all are cut they are adjusted within two iron rings, put in an oven until red-hot, and then "rubbed" backwards and forwards with a curved iron bar placed between the rings, which causes the wires to press against and over each other, and in a very short time all become straight. The treble-barred instrument shown on the extreme right of the picture of "hardening" in our illustration, is used for the larger sizes.

They are next taken in hand by the "pointers," whose operations have for many years excited especial attention, in consequence of the extremely unhealthy nature of their work. The wires are sharpened, or "pointed," at both ends upon a dry stone revolving with great rapidity, and continually throwing off a cloud of fine particles of stone and steel, which, inhaled by the workman, effect certain death at an early age. For years the men refused to adopt means proposed for the at least partial obviation of this fearful consequence, from a fear lest their high wages should be reduced; but, after a strike on their part in 1846, of nearly a year's duration, which inflicted great distress upon themselves and much disturbed the trade, they agreed to resume work on the terms of the manufacturers, who determined upon the introduction of the "fan." This excellent invention (see illustration of "pointing") consists of a sheet iron hood partly embracing and covering the stone, connected with a tube, through which a continual and strong current of air is drawn, which current carries with it most of the stone and steel dust. After a time the pointers began to appreciate the benefit thus obtained, and the lessening of the risks incurred has had a greatly ameliorating effect upon their conduct and mode of life away from the mills.

The pointing is performed thus:—Taking a number of the wires in his left hand, the workman spreads them evenly; then, placing the palm of his right hand upon them, the ends of the wire are applied to the stone, and by a slight movement of the right hand to and fro, they are made to rotate until carefully tapered on all sides. Several attempts have been made to apply machinery to this process; and it seems likely ultimately to supersede the hand labour, as, at the present time, some machines are in use, which are said to succeed very well with needles of ordinary qualities.

From the pointing-mill we proceed to the stamping-shop. The stamper, by means of a die, forms in the middle of the wire the shapes of two heads, and partly pierces the eyes. The die is fixed to the bottom of a heavy mass of iron, which slides up and down between two upright bars, and is set in motion by a cord which passes over a pulley, and communicates with a stirrup upon the workman's right foot. (See illustration.) Holding the wires in his left hand, he rapidly, with his right, places them one by one upon a fixed die, exactly under and corresponding in form with the one in the upper and movable mass of iron, or hammer; then, by elevating the foot, the upper die is allowed to fall upon the wire, and thus the heads and eyes are shaped. This operation is executed with great quickness, and the frequency with which the "tap" of the die recurs is extraordinary.

Next they are "eyed." The girl, as shown in our engraving, with one hand places the double needle in its proper position, with the other pulls towards her a handle communicating with a screw, in the lower end of which is fixed a double-pointed punch. These points are of the same form as the eye-marks left by the stamp, and as the workwoman pulls the handle, the screw turns slightly, the punch is lowered, and completely pierces the two eyes.

"Spitting" follows, and is done by children. Upon two short wires, or "spits," the double needles are threaded, ready for the filer, who files off the burr caused by stamping; by a simple movement bends and separates the needles at the point of junction between the two heads, and thus leaves on each spit a row of *single* needles. He next files the heads into shape, and the needles are now made.

The tool-maker or skilled artisan who fashions the dies and punches, is the most important personage in a stamping-shop, and his work is, perhaps, the most delicate and important in the entire manufacture.

Until about forty years since, needles were made by hand, in a very slow, and, therefore, expensive manner. The introduction of stamping-machines threatened to so entirely ruin the hand-workers that they became infuriated, and in 1830 riotously destroyed all the stamps they could find in Redditch. This resulted in the imprisonment of the ringleaders. More machinery was introduced, and very soon the fate of hand-made needles was sealed.

After the stamping comes "hardening," which, also, is a matter requiring great nicety and experience. Every housewife knows the futility of attempting to sew with a badly-tempered needle. The hardener spreads the needles upon an iron plate or "pan," and puts them in a fiery hole until red hot, when they are suddenly cooled by being poured into a caldron of oil or water. (See engraving.) In this state they would snap very easily, and be of no use, and are, therefore, "tempered," by being again heated to a certain point, either upon a metal plate over a slow fire, or by being placed in an oven, and after either operation allowed to cool gradually. They are next "picked," or rolled over one by one under the finger upon a smooth stone, by which means the "crooks" caused by hardening are detected, and the bent ones thrown out, to be afterwards straightened by gentle taps of a very small hammer upon a steel anvil. Hardening in water crooks a very large proportion; in oil, very few are bent. All were done in water previous to 1840, when in that year Mr. Joseph Turner, of Redditch, father of the before-mentioned gentleman, introduced the oil process, but was met by a storm of opposition from the straighteners. Indignation meetings were held; he was repeatedly mobbed, and at last obliged to leave the town, with his family, work-people, and business. He removed to Stratford-on-Avon (fifteen miles away), but found the place unsuitable, and after a few years returned to Redditch, where, by that time, most of the manufacturers had adopted the improved method, and now nearly all needles are hardened in oil.

From the hardener's, they are taken to the scouring-mill to be made bright, which is effected in the following manner. Upon pieces of canvas, the needles are placed in parallel layers, and have a little oil and emery (a certain kind of stone reduced to powder) poured over them. The canvas is then tightly rolled, with the needles inside, and placed under a "runner," which is a heavy slab of wood made to move backwards and forwards, by means of machinery, upon a fixed bed or bench—in fact, like a mangling-machine. They are kept rolling to and fro under the runner for a period extending sometimes to the length of eight or nine days. The rolls are at intervals taken out, opened, the needles removed to fresh pieces of canvas, fresh oil and emery are added, and the whole then replaced under the slab; until, by the end of the specified time, the long-continued friction of the needles against each other has brought all to a uniform state of brightness.

The time employed in scouring is proportioned to the different qualities made. They come in a confused mass from the scourer's, but are quickly "even'd," or brought parallel with each other once more, by being shaken in a peculiar manner in a shallow tin pan. Next a girl "heads" them—that is, turns all the heads in one direction—and, also, picks out those which may have been broken whilst scouring. They are then spread upon a flat stone, with the heads projecting slightly over the edge, and "blued," or softened, in the eyes with a red-hot bar, previous to the subsequent operation of drilling or burnishing. Drilling is done with a small sharpened bit of steel, made to turn round rapidly, which is passed through the eye of each needle in succession.

In burnishing, they are threaded upon wires, and violently shaken by means of an ingenious little contrivance. Both these operations are intended to clear away any remaining roughness in the eyes, and prevent them "cutting the thread."

After this they are ground, set, and finally polished. The workman spreads some needles upon his left forefinger, with the points inwards; places his right thumb upon them, and slightly touches the heads upon a very small grindstone, at the same time rolling them over by a movement of the thumb. They are then turned over, and the points "set" in a similar manner. He next, holding them in the same way, rubs them upon a horizontal "buff" (which is a small cylindrical piece of wood covered with buff leather) and causes every part of the needles to come in contact with its surface until an exquisite polish is the result. These grindstones and buffs are all made to revolve at a great speed by means of steam power.

The needles are now ready to be counted and folded in the small papers familiar to all ladies; or they are placed in "patent quivers," "synoptical cases," and the like, as the fancy of the trade may dictate. The labels are pasted on by girls and boys, and dried in a heated room. Tying up and packing complete the long series of operations performed upon these little implements of daily use; and it becomes a matter for some surprise that, in spite of the many various processes, they can yet be sold at the low prices usually charged.

Redditch is also the centre of a large trade in fish-hooks, crochet and netting-needles, knitting-pins, bodkins, &c.

A Penny Reading.

At the Working Men's Club and Institute to which I belong, we follow the general fashion of getting up a Penny Reading; and as several of our members attend a singing-class, and others have wives and sisters with sweet voices, who also belong to the class, and are good-natured enough to give us their assistance, the additional feature of music adds greatly to the attraction. We muster about a dozen voices, and can ensure the creditable performance of many of our fine old glees and madrigals, besides more modern compositions. "By Celia's Arbour" goes famously; so do the Earl of Mornington's "Here in Cool Grot" (rather ticklish that in some of the soft passages), Danby's "Awake, Æolian Lyre" (we are hardly strong enough in the basses for the "See it pours" burst), or the quaint old madrigal, "My Lady is as Fair as Fine." Many evening hours, which would otherwise have been wasted, have been devoted to musical practice; and, besides, a good ear and a good will go a long way in music.

So we intersperse the readings with singing; and I wish the former were always as good as the latter. Few of us read well; and yet it is an accomplishment well worth acquiring. If we never read more aloud than now and then a bit from the newspaper to the wife, a short story to the young ones, and the regular chapter at fitting times, it would be all the better if we could pro-

nounce the words properly, read articulately, clearly, and naturally, and observe just emphasis. In fact, reading well is a very delightful art, and gives a vast amount of pleasure. Yet how few there are who are equal to it! Not among us workmen only, who, perhaps, may be excused, as we have not much time to study any of the graces, but among the better educated classes.

We have abundant proof of this at our Penny Readings. Our own members are shy in coming forward; so we are favoured with selections by the gentry and professional men of the neighbourhood. I hope they do not think anything is good enough for us; but it is a real fact that not one out of three appears to have the slightest idea of the requirements of good reading, or, the selection of pieces most appropriate. If I allowed my name to be put down to sing a song, I should previously have some confidence in my own powers, and, at any rate, would try to sing. But some of our friends—with the best intentions, I suppose—appear never to have thought of asking themselves the question, "Can I read, or can I not?" There is reading and reading. If a gentleman with a weak voice offers to read one of Macaulay's ballads, or a selection from "Marmion," one would suppose he would try to convey some idea of the vigour and variety of the style, the dramatic characterisation, the beauty of the verse. If he thinks he has no power to do that, he had better not try it, but choose some mild and level piece more within his scope. Yet I have known a gentleman undertake one of these spirited "Lays"—which, if properly read, would rouse you like the blast of a trumpet—and standing with the book close to his mouth, go on for twenty minutes in a low, indistinct gabble, not audible beyond the occupants of the third or fourth bench, and quite unintelligible to them. I have known another select a piece depending entirely for its humorous effect on the brogue or dialect in which it is written, and preface his performance by saying that, as he is not a mimic, he will not attempt the dialect. Others, having obtained possession of the platform, seem determined to hold it, and convert their reading into a lecture, interspersed with halting remarks and quotations, very difficult to find in a big volume.

But there are others who read well—with taste, expression, and energy, where energy is required; then we have a rich treat, for a well-managed voice, capable of the varied inflections which good writing demands, and guided in the case of poetry by a correct ear for metre, is music indeed. If our other friends, who are apparently unconscious that elocution is an art, would study the matter a little, they would find how much there is to learn, and how very well worth learning it is.

Condition of the Working Classes in Ireland.

Perhaps it may be interesting to the English readers of the Working Man to know something of the Irish working man and his present position. We seldom have this class of subject fairly, and calmly, and candidly brought before the public by those thoroughly acquainted with the question. Our public journals deal with topics of this nature in a partisan spirit, not calculated to benefit the working men of our country, nor advance their interests. In England the Irish working man is too often, we regret to say, seen to a disadvantage. Our object shall be to treat the subject in the spirit of the Working Man, and endeavour to place before the readers of its pages some important facts, and we trust, reasonable deductions drawn therefrom.

In an agricultural country like Ireland, the condition of the great body of the working classes more nearly resembles that of the Dorsetshire labourer than it does any other of the English population. In Ulster—especially around great centres like Belfast and Londonderry, where the linen manufactures flourish—there is a nearer approach amongst the daily toilers to the position of the population of the busy hives of industry in Lancashire and Yorkshire. These two great classes of working men are to be found here as in England. Then we have, of course, the tradesmen and artisans—the skilled labourers—who find employment in providing for the wants of the rest of the community—for the other different classes of society. In many instances, too, the small farmers are tradesmen or labourers, seeking to combine both callings in one person, which we shall see does not tend to give success in either business.

The Irish working classes of the past occupied a different position to that which they do at present, just as happens to be the case also in relation to the working men of England. The "hedge school," which almost ceased to exist some half century ago, did produce, occasionally, rather superior scholars from amongst the Irish peasantry and labouring classes. But there were no means in Ireland for educating the masses. In days passed away for ever, it was criminal to impart education to the great body of the Irish population. Yet, amid many difficulties, even the humbler classes did try to acquire knowledge in its simplest forms. These days are, however, banished. The National System of Education has spread its schools over every part of the land—into every nook and corner of the country. The natural result has followed—the people, the great millions, have become fairly instructed in the rudiments, at least, of a good English education. The National Schools of Ireland—apart from any views politicians may hold as regards a united, or denominational system—are, upon the whole, the best in the United Kingdom. A working man's son, for the fee of one penny per week, and in many places wholly free, can receive instruction in all the branches of a good sound English education. The result has been, that the rising generation of working men occupy a different position to what their forefathers did, and their circumstances have been greatly changed.

An "Irish cabin" may still be seen occasionally; but we question if the day labourer in Ireland is not as comfortable as the same class in the agricultural counties of England. We know the reverse of this is often asserted, and the words of what is known as the "Devon Commission" report, are cited, that—"the Irish labourer is the worst fed, worst clothed, and worst housed of his class in Europe." A much more recent Royal Commission has disclosed the state of English labourers, and we are free to admit that the Irish are better off. We observe, too, that the Scotch ploughmen are now calling attention to how they are treated, when in wet and cold they are left to sleep in some barn, or other part of the office-houses, without fire to dry their wet clothes, which, therefore, they have to put on wet the following morning. Now, it is due to our Irish farmers to say, that this could never occur in Ireland. In ninety-nine cases out of one hundred, the Irish agricultural labourer, residing at the house of the farmer, is treated as one of the family almost. If he comes in wet, the warmest corner at the kitchen-fire is allocated to him, with a kindly word and a pleasant smile. If he can change his wet clothes for a dry suit, the female servants, or the mistress of the house, or her daughters, will take care that his wet working clothes are thoroughly dried during the night, and are made comfortable for him for morning. His wages may not be high, but he is kindly treated, and not too hard worked.

The daily labourer is different from the farm-servant. His dwelling may be an "Irish cabin," but the sketches given of these in books are mere fancy; or at most an exceptional instance is taken and treated as if it were the rule. Often have we seen the labourer's "cabin" neater, cleaner, tidier, and more comfortable, than the employer's residence. The labourer's wife may have been a servant at "the big house" of the local magistrate, or at the "glebe house" of the rector of the parish. She learned there to "keep things neat." But the farmer's wife had been brought up a farmer's daughter, with the pigs too often fed in the kitchen, with the geese and ducks allowed "the run" of the same apartment, with a mud-hole before the door into which all slops were flung; and she continues in the same habits, thinking only of rearing calves, pigs, making butter, paying the rent, and increasing the little horde in the "old stocking." The son of the Irish labourer is often left longer at school than the son of the smaller class of farmers, and on the whole the labouring classes have more desire to acquire education than the smaller class of farmers.

In Ireland it has become a habit to complain of the condition of the people, and to attribute it to misgovernment. Our object is to seek to show that the same position is occupied by labourers in even the most prosperous lands; and that if men are to rise to a higher status and more comforts of life, it must be by personal exertions and individual effort.

Want of knowledge of the state of labourers in other countries, makes too many here conclude that there is nothing in the world equal to the misery which they endure. We have none of the evils, permit us to say, in connection with farm labourers in Ireland, which are known in England. The "gang" system is unknown. Young people are not hired out in "gangs," to be treated almost as slaves, as the children of the labouring classes are in some agricultural districts in the South of England. The intermixing of the young of both sexes, and the fearful consequences which follow, are not known in Ireland. It would be impossible, too, to get an Irish boy or girl ignorant of the great leading truths of religion. We often see records of English children brought up without a knowledge of even the existence of a God, or an idea of what are his attributes, and of the duty mankind owes to him. Every child in Ireland is instructed in these things, and the result is a higher tone of morality—fewer illegitimate births, and infanticide is all but unknown.

We do not say that wages are altogether as high in Ireland for farm labour as in England. We, however, do contend, that the money earned is, on the whole, worth as much. The Irish labourer is never obliged to take part of his wages in beer, or spoiled cider. He seldom or never drinks these. He generally receives his wages in full, or else in "kind" of a valuable description, and such as he needs—potatoes, milk, &c. Fuel in Ireland is for the most part cheap. The farm labourer saves his own peat, and never wants in winter for a good fire, except it be his own fault. Provisions, too, are generally cheaper than in England. Flour, oatmeal, and Indian meal are readily procured at reasonable prices. Buttermilk can be had cheap; and if the wives of the labourers only knew better what excellent dishes could be made from the various vegetables which can be had by them at the most trifling cost, the condition of the Irish labourer would be, taking all points into consideration, little, if anything, inferior to his brother toiler in England, so far as the means of living are concerned, while in other features it is much superior.

We question, too, if, viewing all the aspects of the case, the Irish labourer in England is so "well off" as his brother in Ireland. We have seen the Irish working man in London, Liverpool, Manchester, Bolton, Preston, Dudley, Hanley, Newcastle-under-Lyme, and other places in England, and, while he earned more wages, we were rather inclined to believe that he had not even the same comforts as the same class in Ireland possess.

There are great trials and difficulties to be contended with by our day labourers, as by many other classes, but they are nearly all of such a nature that by individual and united effort of the men themselves, with the kindly approval, counsel, and aid of employers (and these can be had), they may sooner or later be overcome.

*Fish and Fishmongers.**

But very few portions of the British coast are barren ground to the fisherman; and the North Sea and the coast of Holland yield immense stores of marine food for the London market. Folkestone and Dover send whitings and soles, and the largest and finest turbot and brill. Mackerel come from Yarmouth, Norfolk, and Mount's Bay, and other parts of the coast of Cornwall. Sprats are caught almost everywhere, but more especially off the Kentish shore. It may not be out of place, *apropos* of sprats, to mention the fact—which has, however, nothing whatever to do with Billingsgate—that the sardines, with which the London grocer's shops are now so liberally supplied, are simply sprats. The sardine is a sprat prepared in a particular way for the table. They came originally from Sardinia, and hence their name. The fish are divested of head and entrails, steeped in brine, boiled in oil, then enclosed in air-tight tin cases, again boiled, and, unless the cases burst in the process, are then fit for market.

Besides Yarmouth and Holland, whence herrings were formerly chiefly supplied, both fresh and in a cured state, Scarborough, Whitby, and other ports on the coast of Yorkshire, and notably

* Concluded from page 119.

Scotland, now send immense quantities of this fish to market. Scotland, indeed, may be said to monopolise the trade in salted and smoked fish. The quantities of haddock, smoked and dried, of herrings, salted and kippered, of sprats, smoked and otherwise cured, sent from Scotland, are something enormous, and furnish an article of food cheap and nutritious, and which in its abundance is a modern gain. The rapidity of transit has improved a market which formerly was both scantily and ill supplied, and has shown that in the matter of a palatable food, the demand is governed by the supply. It has, however, been complained of late, that in order to accelerate the production, the method of salting has been less perfect. The plan now adopted of steeping the fish in brine, instead of rubbing dry salt into it, is more rapid, but not so efficacious; and a loss of flavour and power of resisting decomposition has been the result.

The whole of the south coast of England is an inexhaustible fishing-ground for almost every kind of fish to be found in our northern waters. Each species has its season, and are sought for accordingly. There are some fish caught in the English Channel which, from some special causes, rarely reach the London market. The hake, for instance, a delicate and nutritious fish, very popular at Portsmouth, is rarely, if ever, seen on the banks of the Thames. The waters of the North Sea are also especially prolific of fish of many valuable sorts, and the celebrated Dogger Bank, off the coast of Holland, furnishes codfish in undiminished quantities. The English and Scottish coast, bordered by the North Sea, is a famous nursery for fishermen, on account of its abundant supplies of fish. Holland, besides its other marine treasures, supplies London with salmon of a very large kind, when the Scottish and English rivers are still undrawn; and so well are the arrangements made, and so rapid is the conveyance from the fishing-ground to the market, that cod will be brought to Billingsgate from distant points in the North Sea, so far alive, that they will crimp—an undoubted proof of sustained vitality.

Crustacea abound in every cove, and on every sloping beach of our island. They are brought to market while still living, and there are boiling-houses near the market, where, at a trifling cost, they can be made ready for consumption. Shrimps are cooked at the places where they are caught, as otherwise they would be difficult of carriage.

The smaller fry of fish, such as gurnet, or pipers, small whitings, shad, dabs, and others, when they find their way to market at all, are sold at a low price, in parcels, under the title of "offal." The fishermen very often return such small catches into the sea, or retain them only as bait for larger fish. The double hooks used in catching mackerel will be baited with pieces of cod fish, and cod are caught with a bait of clams, squids, or capelins, or even a portion of the codfish itself. Whelks, too, are often used as bait for deep-sea fishing, and are sold at Grimsby for that purpose at 4s. and 5s. a sack.

So much for the fish. A few words upon the fishmongers. According to the census of 1861, there were 3,258 male and 209 female fishmongers in London and its suburbs. Of these one is entered as five years old, and more than 400 as under fifteen. These juvenile tradesmen were certainly not shopkeepers. It is curious to trace the fluctuations in the numbers of fishmongers, or vendors, according to the nature of the district in which they are found. They invariably are most numerous in poor neighbourhoods, which fact at once calls up recollections of certain flat trays on wheels, or mere wicker baskets, or barrels, planted in the roadway, close to the kerb, in certain crowded districts, and the sometimes not unsavoury, at others undeniably rancid, odour which fills the air of such localities. Bethnal Green had 184 fishmongers, so called, which is more than three times as many as Westminster, which had only 60. All the eastern districts stand out pre-eminent as dealers in fish, and are only matched in the north by St. Pancras and Marylebone. Whitechapel takes a place next to Bethnal Green; and, strange to say, Hampstead and Rotherhithe are on a par within one, the former claiming 14, the latter 15 fishmongers, these being the lowest numbers on the list. The City of London figures only for 118, including, of course, Billingsgate; but, then, it must be remembered that Billingsgate is not a residence. As a market, it has many tenants. They are divided into "salesmen," "bummarees," and "casuals." The salesmen form the most important class, and occupy some 69 stands. The bummarees are a sort of middlemen, who buy in large quantities to retail their purchase to the fishmonger. There is no monopoly or interference with fair trade in this arrangement. The fishmonger is at perfect liberty to buy of the salesman, if it suits his purpose; but, in very many cases, it is more convenient for him to buy exactly the quantity and quality of fish he wants from the bummaree. There are some 63 bummaree stands or forms. The casuals are humble salesmen, who have no real standing in the market, but who "pitch" themselves wherever they can find room. Sometimes they are allowed to take possession of an unoccupied stand for a small consideration. It is from this class that the established salesmen or bummarees are recruited, and those who desire it have their names entered on the books for stands as they become vacant, taking their place by rotation.

The salesmen's stands are let by the week, and vary in rent according to position. The best are charged at the rate of £1, others less favourably situated at 15s., and others, again, at 10s. and 12s. per week. The bummarees pay from 5s. to 7s. a week for their "forms," and the casuals 6d. a morning. All these occupiers alike are tenants at will, but are never removed from their positions so long as they faithfully observe the regulations of the market. The widow of a salesman is always allowed to retain her husband's stand if she wishes to carry on the business.

From masters we come to men, and these may be divided into three classes—the salesmen's assistants, the "shorers," and the "bobbers."

The first are weekly servants, and are but poorly paid. Many receive no more than 15s. a week, the majority not more than £1, and only some few, who have a post of more responsibility than their fellows, and who, perhaps, are called upon to exercise control over others as foremen, earn £1 5s. weekly. Their hours of work are early if not very prolonged, and their labours not light, nor always agreeable.

The shorers are labourers employed by the salesmen to unload the steamers and cutters of their cargoes, as well as the vans on the land side. They usually work under a head-shorer, and their labour is reckoned at from 4d. to 6d. per barrel or package, for the safety of which the head-shorer is responsible from the vessel or van to the stand. The head-shorer's proportion of pay is 2d. or 4d. a parcel, according to size and weight. The shorer, although his labour is of the hardest, is not ill remunerated.

The bobber is a sort of light infantry among labourers. He is generally his own master, willing and ready to serve whoever needs him. He hangs about the auction-stands, ready on an instant to exhibit the fish to be sold by hoisting it on his head, and so acquiring the right to carry it out of the market. The bobber is paid by the purchaser at the rate of 1d. a load, if the distance is only into Thames Street, and not beyond the bridge (London Bridge) on the one hand, or Tower Hill on the other; but if he has to ascend any of the steep streets which face the market, or to pass the boundaries of bridge or Tower, west and east of him, his pay is 1½d. a load. If the bobber is nimble and fortunate, he may earn a fair wage for a labourer; but his receipts are very uncertain, and may be reckoned by shillings or pence per day, as the case may be. Sometimes there are several bobbers engaged at one stand, in which case there is a head-bobber, who is responsible to the salesman for the safe delivery of the goods. The head-bobber receives all the bobbing-money, and pays the subordinate bobbers each his share at the end of the morning's work.

Cheap fish is undoubtedly a great blessing to the poor, and it is evident, from the statistical returns quoted, that they avail themselves largely of any such advantages offered to them. The quantity of fish—chiefly plaice—fried in dripping and batter, and sold in slices at a penny, and even a halfpenny each, is beyond calculation.

The total number of visitors to Kew Gardens last year was 55,934 in excess of that of 1864. There were 260,040 visitors on Sundays, and 269,201 on week days. The smallest week-day attendance was on October 26, when there were only nine visitors. On the previous Sunday there were only 17. On the 5th of June—a week day—as many as 19,849 visited the gardens in one day; and on a Sunday in July there were 16,842.

SWEET REST.

'Tis sweet to rest when work is done,
And daylight shortens in;
To watch the calm receding sun,
And feel a glow within.

'Tis sweet to sit and loose the tide
Of healthful thought amain;
To spread the sail, and gaily ride
In fancy's light domain.

To muse, and mark, and murmur none,
To tinge with golden dye;
The world's rebuffs to smile upon,
Or soften to the eye.

And many, many things to see
On dreamland's mystic pile;
To picture man, like liberty,
Serene from worldly wile.

Ah me! but dreams are like the sky,
Now seeming fair, now black;
And rest is short, too soon to fly,
In bygone's endless track.

Yet still, 'tis good to rest and smile,
And work your path along;
And now and then an hour beguile
With dreamers and their song.

Charles Wilkinson.

Practical Hints in Carving Wood.

BY A WORKING MAN.

Amateurs desirous of learning the art of carving in wood, should be very neat in everything they attempt to execute. Ornament cannot be overcharged if it be good, but is always overcharged when it is bad. It would be well for the young beginner if he practised ornamental drawing a little, as drawing facilitates the manipulation of the art of carving. The tools required by the wood-carver are numerous, but the amateur does not require all of them. He will commence by procuring a piece of deal about 5 ft. long by 10 in. wide, and 2 in. thick. Four legs should be put into it, and it must be made to stand firm. Then he will provide himself with a screw holdfast and a small mallet, as the practice of striking the

handle of the gouging implement with the palm of the hand is attended with danger.

The tools absolutely necessary for the beginner are fourteen in number—viz., one one-inch firmer, one three-quarter corner firmer, one quarter firmer, one half-inch flat gouge, one quarter-inch flat gouge, one small parting-tool, two quick gouges

(large and small), one small veining-tool, two fluting-tools (large and small), one bent parting-tool, and four bent tools of different sizes; also, a soft Turkey oilstone for sharpening the outside edges of the tools, and a few slips of the same, round on the edges, for sharpening the inside edges. These tools may be procured at the principal tool shops, such as Fenn's, Buck's, and others, and are inexpensive, costing from 6d. to 1s. each, the handles 2d. each.

While giving particulars on the sharpening of tools used in the art of wood-carving, we shall offer some advice. Let it be well understood by the amateur that in this branch of the art he cannot be too particular. He should have the Turkey stone slips made to fit as near as possible to the inside edges of the tools, and the gouges should be well rubbed from the inside; and it is well to rub them, first of all, with water-stone. It is also advisable to have a piece of buff strop, on which may be rubbed a little emery and oil, made into paste; for, after sharpening the tools with the Turkey oilstone, there remains what is called a *wire edge*, and by rubbing the tools on the strop it comes off.

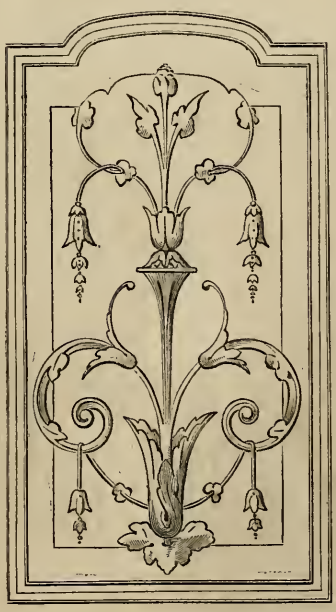
We now return to the hints which should be attended to by the amateur. He should attempt the simplest style of ornamental carving at first, and be very decisive in the cuts he makes with the gouges, for false cuts often spoil the effect of the ornament he is working. Lady amateurs often excel gentlemen in the art. In fact, we have seen some very fine specimens of carving in wood executed by ladies, for whom the art is admirably suited, as it affords an interesting indoor occupation, as well as great relief from other and monotonous employments. It would be well for the amateur carver not to use glass-paper, for it very often spoils the appearance of the work; and we should also advise the learner not, under any consideration, to polish his work, but simply to use a soft brush (an office nail-brush, for instance, answers admirably), rubbing a little beeswax well over the hairs of the brush, and then to gently rub the carving with it, and it will be found to produce the desired glossy appearance. Those who desire making a pastime of wood-carving would do well to take a lesson from a professional carver, as it would give them a great insight into the manipulation. There are many who would give a lesson for a small remuneration; but for those who would be self-taught we subjoin the following rules, which will be found useful:—

In the first place, after procuring a piece of sycamore, plane it all over if it be intended for a panel or watch-stand. Those who have small work-boxes can make little pieces of carving for them in the shape of a round or square panel of oak-leaves and acorns, and screw the carvings on to the top from beneath.

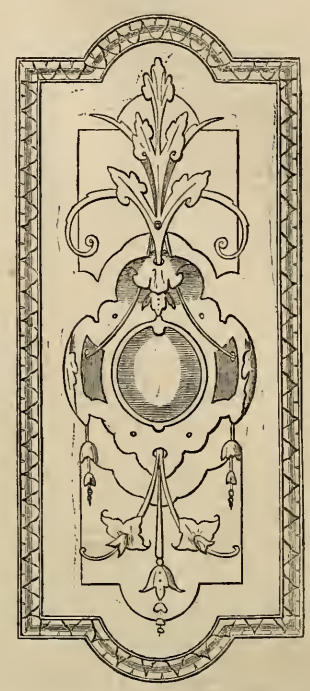
For the benefit of our amateur readers, we give three sketches of very handsome patterns of panels, in the Renaissance style, which they can produce in wood. These panels may be made larger by the carver in working them; and, if properly executed, they will look very handsome, and are things well suited for the amateur. Should the beginner find he cannot succeed at the first attempt, he must make another trial, till he succeeds. These panels, when well-executed, would form good subjects for a Working Man's Exhibition.

The amateur, in commencing these designs, should first sketch them out on the piece of sycamore, either by drawing or tracing, then commence operations by using No. 1 parting-tool. After cutting all round the outline of the ornament, proceed by cutting straight down the edges with No. 2 three-quarter flat gouge, and excavating in turns by No. 3 quarter-inch bent flat chisel. Care must be taken to fit the ornament, such as the leaves and the scrolls, with the right-sized gouges. Having done the edges of the ornament and the groundwork, commence by touching lightly over the leaves, curled tendrils, and scrolls, and the amateur will be careful not to cut against the grain of the wood; and cut it as clean as possible, taking his time over it. Having cut it neat and clean, proceed to veining the leaves with the veining-tool. Sink the ornament about half an inch, and let the piece of wood be about an inch thick.

In conclusion, we shall offer a few remarks on the progress of wood-carving during the past ten years. Now that the art is so extensively practised in this country, we have amongst us at present wood-carvers who can rival our Continental neighbours. Some of the East and West End firms of the metropolis have workmen in their employ who are second to none. Some fourteen or fifteen years ago, a Scotchman, of the name of Duncan Keith, a wood-carver of no mean ability, came to London, and it is to him that the progress of wood-carving at the East End of



London is indebted for its present advanced state; and also to the indefatigable zeal of Mr. Turner, of Islington, a manufacturer of chairs and couches. The question has been asked, "Who gets credit for the advancement of the art? Is it the carver who executes the work, or the manufacturer who employs him?" Neither; but the large commercial houses, which get all the honour and credit due to the working man. For let it be understood that the manufacturers do not reap the benefits they ought: while the manufac-



turer gets about twenty per cent. on the work, the large commercial houses get nearly cent. per cent. Good carving, like painting, requires time and patience. Those who are acquainted with the art of painting must know that it cannot be well executed if hurried; so it is with the art of wood-carving. And so it often happens, unfortunately, that many a piece of beautiful carving, that might well be considered a work of art, is positively spoiled through want of proper time to execute it. And why so? Because, as is well known, those large establishments require such an enormous profit that manufacturers cannot supply the article as perfect as it ought to be. In France, wood-carvers are allowed their own time over their work; but in England a carver has to hurry his work, for the reasons explained above, and hence it is that the carving coming from Paris is very often superior to ours.

Grievances of Ploughmen.

BY THE REV. DR. BEGG.

IMPERFECT ARRANGEMENTS IN REGARD TO COTTAGES.

There is a wailing for the dirt, and vice, and misery which must prevail in houses where seven or eight persons of both sexes and all ages are penned up together, for the night, in the one rickety, foul, vermin-haunted bedroom. The picture of agricultural life unrolls itself before us, as it is painted by those who know it best. We see the dull, clouded mind, the bovine gaze, the brutality and recklessness, the simple audacity, and the confessed hatred of his betters, which mark the English peasant, unless some happy fortune has saved him from the general lot, and persuaded him that there is something besides beer that the poor man may have and may relish.—*Saturday Review.*

We have already called attention to one important defect in many rural cottages—viz., that they contain only one apartment, and are otherwise often ill fitted to promote the comfort and purity of domestic life. We proceed to remark, in connection with imperfect arrangements in regard to cottages, *that there are sometimes by far too few of them.* This applies both to the districts which contain good and bad cottages. Sometimes the discomfort of foul and rickety dwellings is augmented by the consideration that it requires

a struggle to get any house at all; whilst, when better and more substantial, nay, even sometimes highly ornamental cottages are erected, they are only erected occasionally, in small numbers, and in prominent localities, for show rather than for utility. There is not in many cases, either on the farms or in the immediate neighbourhood, anything like sufficient accommodation for the people who must necessarily be employed, and who must, therefore, seek it at a distance from their work. What the precise proportion of cottages is which should be provided in connection with a well-conditioned system of agriculture, has not been positively fixed, but, considering ploughmen, farm labourers, and a convenient number of smiths and carpenters, it has been calculated by Mr. Hope and Mr. Skirving, two large farmers in East Lothian, and very competent judges, that there should not be less than two good cottages in connection with every plough employed upon the land. It will be found that in very many districts nothing like this proportion has been provided; nay, it has sometimes been remarked that, in the course of modern alterations—improperly called improvements—where one cottage has been erected two have been destroyed. The result of a careful examination, therefore, will often be found to prove that our rural cottage system is, at least, as defective in quantity as it is in quality; whilst, in some districts, as we shall afterwards have occasion to show, there are few or no cottages at all.

Here, then, is another great source of evil and discomfort; and it is an important question to what cause or causes we are to trace a state of things so disadvantageous to landlord, tenant, farm labourer, and the general community. The causes are, no doubt, various. The present system of improved farming has grown up almost insensibly, and in the transition the interests of the ploughmen and labourers have, unfortunately, not occupied a very prominent place. The farmer has naturally taken care, in most instances, to secure a very good house for himself. We cannot blame him for this. Stables and cow-houses have also been built with due regard to sanitary arrangements. The disease and death of cattle is a serious and costly affair, and must, if possible, be prevented. To secure these objects, a considerable outlay is indispensable, and some of our landlords have no superfluous funds to spare. The discomfort, and even death, of the working man have, rather unfortunately, no pecuniary aspect; and although our landlords and farmers are as humane as other people, it is pretty certain that if men had to be bought, or if every disease resulting from an unwholesome cottage could be made, as in the case of the cattle, to assume the form of a pecuniary demand, a much deeper interest would immediately be felt in the sanitary and social arrangements connected with the cottages of rural labourers. In the absence of this element, the matter has generally been postponed, slightly considered, and often totally neglected. Besides, there was, at one time, a great delusion abroad in connection with the large and improved farm system. It was supposed that, in consequence of the growth of mechanical ingenuity and otherwise, comparatively few labourers would soon be required, and therefore that very few cottages would be necessary. Like the analogous idea which prevailed in connection with the progress of railways—viz., that horses would soon be totally superseded, and got for half nothing, so it was supposed to be unnecessary to build many cottages, as there would soon be very few labourers to occupy them. Both these ideas have been found to be purely fallacious, and many are now ready to maintain, and with great force, that the highest farming requires the employment of the greatest number of hands.

Other causes have undoubtedly had a much greater influence, however, in restricting the number of cottages. The non-residence of landlords, whose agents or factors often give the farms to the men who offer most rent, and seek least outlay in cottages, or in anything else, is one great cause. The expensive plans of cottages devised by architects, who are paid a per-centage on the amount spent (like the lawyers, who are sometimes paid by the page), and who are thus induced to frame expensive designs, is another cause. Landlords who build a few cottages in this way, get frightened at the cost, and abandon the task. The law of entail, which makes a landlord a mere life-renter, whose interest it is, as he thinks, to get as much out of the estate, and to spend as little as possible, has, undoubtedly, been very prejudicial. The rage for game preserving, which has made some of the landlords dream that a dog and a gun are found concealed in every cottage, has tended to diminish the numbers of them, and even to lead to their wholesale extirpation. Previous to the Union Chargeability Act, it was proved also that the poor law operated in precisely the same way, by inducing the landlords to refuse to erect, and to pull down, cottages, lest their inmates should become ultimately burdens upon the parish. The old chiefs reckoned themselves rich in proportion to the number of their hardy retainers, upon whom they looked with pride; but by the contradictory and pernicious operation of some of our laws, the wish to be "alone in the earth" is mightily strengthened, and the social state of the country most seriously injured.

What is the practical effect of this great restriction in the number of cottages to which we have referred? Not only the fearful over-crowding so often spoken of, resulting in immorality, disease, and death, but a crowd of other evils not yet fully developed. So long as farming goes on, labour and labourers must be had. For a time the labourer may walk long distances in the morning and evening, although it is a most cruel addition to his toil. We have known them walk six miles each way, or twelve miles daily, in addition to all their hard work. By investigation, we find that to travel twelve miles a day is itself the whole work of some omnibus horses—and why should men be so oppressed? But it is obvious that this state of things cannot continue, and the "gang system," which is spreading like a moral pestilence in some parts of England, seems one of the offshoots of this deficiency of cottages. A man hires a large number of workers, and marches them from farm to farm to do farm-work, like a squad of strolling players. They work during the day, and dispose of themselves as they best may during the night, without much regard to comfort or decorum. Let this system only spread a little further, and rural society will be dissolved. Unless proprietors, who are fighting against nature in restricting the number of cottages, are lost to all forethought of consequences, they will see what a tremendous retribution they are laying up in store for themselves. The system in question bears a perpetual resemblance to the harvest-barns of Caithness, which occur only once a year, and from the same cause—the want of other accommodation. The whole of the reapers are indiscriminately turned into these barns at night, and a friend of mine who visited one of these night encampments, says that a more perfect chaos of brutality, blasphemy, and obscenity, it is not possible to imagine. It will be well if the attention of our men of influence is turned to this matter in time. We are happy to say that there are indications of decided improvement, and that on very many farms the arrangements are of the most admirable kind. Elihu Burritt, in his "Walk from London to John O'Groat's," lately published, tells us that he visited the farm of Mr. Samuel Jonas, situated chiefly in Essex, and containing about 3,000 acres—the annual expenditure being about £10,000. What he saw there may now be seen in many other parts of the kingdom; but the great matter is to get it made universal.

He says:—"There was one feature in this great farm-home which I regarded with much satisfaction. It was the housing of the labourers employed on the estate. This is done in blocks of well-built, well-ventilated, and very comfortable cottages, all within a stone's-throw of the noble old mansion occupied by Mr. Jonas. Thus no long and weary miles after the fatigue of the day, or before its labour begins, have to be walked over by his men in the cold and dark, as in many cases in which the agricultural labourer is obliged to trudge on foot from a distant village to his work, making a hard and sunless journey at both ends of the day."—Page 182.

There is one other defect in our cottage arrangements which we shall do little more than name, viz.:—

In many instances cottages *are not regarded as part of the regular appurtenances of a farm.* Rent is charged for them, as if they had no necessary connection with the farm; and it is alleged as a reason why more or better cottages are not built, that they do not pay. To our mind this is all a delusion, and proceeds upon a false principle. We never ask the farmer to pay a separate rent for his house. We never calculate a separate rent for the houses necessary for the cattle and horses required upon the farm. Our calculation is that the one rent paid for the land covers all, and the same principle should be applied to the cottages of such labourers as are necessary in the cultivation of it. Lord Palmerston, in an admirable speech some time ago, set forth this view very forcibly; and it is, we believe, the only sound one—the only one likely to secure an effectual remedy for the existing evils.

THE NIELLO PROCESS.

FROM THE ITALIAN OF BENVENUTO CELLINI.

Take one ounce of pure granulated silver, two ounces of pure copper, and three ounces of refined lead; put the silver and copper into a large crucible, and place it on a clear fire, and raise the heat with the bellows. When the metals are melted and mixed by stirring with a stick of charcoal, add the lead; then quickly withdraw the crucible from the fire, and stir the metals together until they be thoroughly mixed; then take a stone bottle of sufficient capacity, with a neck as large as a fore-finger, and half fill it with sulphur, into which pour the melted metals; then stop the bottle with a piece of moist clay, holding the bottle in the hand, covered with a wet cloth. While the mixture is cooling it must be continually shaken; and when cold, the mixture is removed by breaking the bottle. It is now of a black colour, in consequence of the admixture of the sulphur. This is the *niello*, which will be found in the shape of small grains. This is again put into a crucible over a gentle charcoal fire, and, when melted, poured into a stone bottle, and shaken until cold. This operation is repeated two or three times, and the bottle into which it is poured broken each time. Only the finest and equal grains are selected. Take the plate which is to be engraved, and, as the beauty of the niello depends upon its being uniform and free from blisters, it is necessary to boil the plate in water containing wood ashes, or pearl ashes, or soda, for a quarter of an hour, and leave it for another quarter in the ley; it is then put into a tray filled with clean cold water, and rubbed all over with a stiff brush until all dirt is removed. It is then fixed upon an iron tool, something like a gridiron, of a size sufficient to hold the plate. The iron must be neither too thin nor too thick, so that it and the plate may be uniformly heated when the process of making the niello is going on; for if either the iron or the plate be unequally heated, the result of the operation will not be satisfactory.

The niello is broken upon an anvil or a stone slab into grains the size of millet seed, neither larger nor smaller, and put into a glazed pot, and well washed in cold water, to remove dust or other impurities, which, if present, would injure the work; then take a brass or copper spatula and spread the niello over the engraving to the thickness of a knife-blade, and sprinkle over it a little borax finely powdered, but not too much. Have a charcoal fire ready, then bring the plate gradually over it, and hold it there until the niello begins to melt; for if too strong a heat be applied at first, the work will become red, lose its good qualities, and turn soft, so that the niello, which consists mostly of lead, would destroy the engraving, whether on gold or silver, and the operator would lose his labour if he did not seize on the right moment.

While the plate is over the fire, have an iron wire, thinned at the end, and heat it in the fire, and as soon as the niello on the plate begins to melt, pass the iron wire over the engraving; then, as both are warm, the niello will become like melted wax, and thus unite and spread over the plate with facility.

When the plate has cooled, take a fine file and remove some of the niello, not so as to expose the metal plate, but only sufficient to discover the engraving. The plate is then put over the cinders of the fire, and when it has become so warm that the hand cannot endure the heat, take a steel burnisher and a little oil, then burnish as much as may be required. The object of this burnishing is to fill up any holes or inequalities in the work. By practice and patience all defects may be repaired; but to complete the work, a skilful workman will take up the scraper and finish by exposing the engraving—that is to say, the white portion of the plate, where the metal is exposed—then polish it with charcoal-dust and tripoli, immersing the plate in water at intervals, until the work becomes smooth and brilliant.

Lord St. Leonards' Arbitration Bill.—An adjourned meeting of trades' delegates, for the consideration of the Arbitration Bill introduced into Parliament by Lord St. Leonards, has been held. After a long discussion, in which a general desire was expressed that further explanations should be obtained from Lord St. Leonards before the trades could come to a decision on so important a subject, it was ultimately resolved that a deputation should wait upon his lordship, and report the result to an adjourned meeting on Thursday, the 8th of March.

Men who have Risen from the Ranks.

V.—HENRY KIRKE WHITE.

WE pass from potters to poets—albeit great potters like Palissy are poets in their way—because the life of a poet and scholar, who made his way from a very low estate to a position of distinction, if not of eminence, is a matter of instruction, both in the way of example and, in Kirke White's case, of painful warning also.

Henry Kirke White was born at Nottingham, on the 21st of August, 1785. He was the son of a butcher. Young Henry White was intended for his father's business. In his leisure hours and one day every week, he carried a butcher's basket about the town. He, no doubt, owed to his mother, who was a woman of some education, and who opened a school in Nottingham, his initiation in the pursuit of knowledge. At seven years of age, he commenced prose composition; at thirteen, he wrote a poem. This precocity was a bad sign, as far as his health was concerned; but in those days the laws of Nature were little understood. At the age of fourteen, he was placed at a stocking-loom—indeed, put apprentice to a stocking-weaver. But his thirst for knowledge rendered this trade distasteful to him as the business of his life. There were no People's Colleges then in Nottingham, as now, nor Working Men's College, such as happily exists in London, or young White might have followed his trade, acquired knowledge, distinction, and a degree, and possibly preserved his health. His mother found means to place her son in the office of Messrs. Coldham and Enfield, the then town-clerks of Nottingham. By this time young Henry had acquired a knowledge of Latin, with very little instruction, and had begun the study of Greek. To these languages he afterwards added Italian, Spanish, and Portuguese; chemistry, astronomy, and electricity also engaged his attention; drawing was another of his pursuits, and he played very pleasantly by ear on the pianoforte. He showed a capacity for practical mechanics. At the same time, he occupied himself in the study of law with such industry that it was deemed wonderful—so busied were his days with it—that he could find time for anything else. This was enough to kill any young man, and it killed Henry Kirke White eventually.

A student whose mind is subjected to early discipline, will make immense progress without harm—a progress that would undermine the health of any one who attempted the same circle of learning in a desultory way: but the application of the nights to learning, when the days are devoted to exhausting office duties, always tells on the physical constitution; and the probability is that young White had no sufficiently nutritious diet adapted to sustain such immense and protracted physical exertion and waste of nervous power. Sir William Follet, with scarcely less avidity for learning than White displayed, coupled with disregard of the proper physical conditions of close study—namely, by sitting in damp chambers—undermined his constitution, and broke down in the dawn of his great fame, and all his fine powers perished prematurely. Charles Buller, whose recreation, Macaulay tells us, was reading works on the statistics of China, or the political economy of Siam, or similar brain-drying treatises, died when his fine Parliamentary genius had drawn the highest attention to him.

In his fifteenth year, Kirke White was seeking distinction as a speaker in a literary society in Nottingham—his other pursuits not satisfying his voracity of acquisition; and to this oratorical consumption of his time, wholesome in itself in moderation, he added the occupation of correspondent to various periodical publications. The *Monthly Preceptor*, the *Monthly Magazine*, the *Monthly Visitor*, the *Monthly Mirror*, received contributions from his pen—we ought, in truth, to say contributions of parts of his life, which he was giving away with a lavish hand. He was scarcely seventeen years old when Mr. Capel Lofft appeared upon the stage, and induced him to prepare a volume of poems for the press, which, amid other studies, he wrote. The volume was severely treated by the reviewers. How was it possible that such an intellectual slave could produce anything fresh or original? He worked like a locomotive that ran incessantly and never stopped to take water. His poetry must have been the attenuated vapour of the brain.

Before this volume was published, young White considered himself, or was considered by others, to have a tendency to infidelity. It is quite clear, however, that a great change was wrought in White's opinions and his whole intellectual being, by his conversion from indifference to religion, to a deep and lasting conviction of the truth of Christianity. The passionate strength of his religious feelings is no mean proof that he had strong natural powers; and had his life happily been spared, and he had ever enjoyed repose and health, he would have made no mean mark in the literature of his country. Disease gave, as it always does, a morbid tinge to many of his poems; but his felicity of versification, and a certain earnestness of feeling and force of diction, were remarkable. His well-known "Star of Bethlehem" is an example of the sweetness, fervour, and grace with which he would have enriched the lyrics of religion.

The publication of White's volume of poems procured him the notice and friendship of Southey, to whom he was principally indebted for the interest felt about him. The Duchess of Devonshire, to whom his volume was dedicated, was expected, after the custom of dedicators of the period, to do something for the young poet, but did not. Friends, however, came to his aid, and by the assistance of Mr. Simeon, of King's College, a sizarship at St. John's, Cambridge, was procured for him, and he commenced his education for the church. His legal employers, who probably had no great confidence in making a steady lawyer of a young poet, kindly consented to the arrangement. A scholarship becoming vacant, he was advised to compete for it. His health was then sinking. He had the sense to decline examination on account of his failing strength; but he was prevailed upon to change his resolution. He won the scholarship. He was pronounced the first man of his year. But Death put his inexorable mark upon him, regardless of his college distinction. Instead of seeking rest, he came up to London, and added its excitement to his disease. The next year he was again pronounced first at the Cambridge examination. The college now offered him a private tutorship in mathematics during the long vacation—as though mathematics were a cure for consumption. In these wiser days, such a student would be dispatched to a sunny clime, to pass his vacation in rest and recreation. He paid another perilous visit to London, and returned to Cambridge to die. He perished on the 19th of October, 1806, in his twenty-second year. Such a death would now be regarded as an intellectual suicide. The laws of physical health have to be observed, as well as moral and religious laws. Ignorance of physical law was no demerit in White, for it was the defect of the time in which he lived. He, however, knew very well how his end came. "Were I," said he, "to paint Fame crowning an undergraduate, I would put a death's head under his mask."

Southey generously stood the friend of his memory, as he had of his life, and edited his "Remains," and gave him honourable repute, though praise could not soothe the "dull, cold ear of death." A young American gentleman, Mr. Francis Boot, of Boston, erected a medallion, by Chantrey, to the poet's memory, in All Saints' Church, Cambridge. But the noblest and most enduring of all tributes to his memory came from Lord Byron, who probably had sympathy for him, because he was, in a sense, his neighbour, being born, as it were, in the neighbourhood of Newstead Abbey. White's early volume of poetry was abused by the critics, like Byron's "Hours of Idleness," and certainly had as much poetic talent as the noble lord's first efforts in verse. Byron considered that, like himself, White would have vindicated his genius had he lived. Kirke White had undoubted force of character, to have raised himself by sheer industry and study from the butcher's basket to University distinction; and Byron, though differing from him in opinion, wrote in his "English Bards and Scotch Reviewers" this striking and generous estimate of Henry Kirke White's career:—

"Unhappy White! while life was in its spring,
And thy young muse just waved her joyous wing,
The spoiler swept that soaring lyre away,
Which else had sounded an immortal lay.
Oh! what a noble heart was here undone,
When Science' self destroy'd her favourite son!
Yes, she too much indulged thy fond pursuit,
She sow'd the seeds, but death has reap'd the fruit.
'Twas thine own genius gave the final blow,
And help'd to plant the wound that laid thee low:
So the struck eagle, stretch'd upon the plain,
No more through rolling clouds to soar again,
View'd his own feather on the fatal dart,
And wing'd the shaft that quiver'd in his heart;
Keen were his pangs, but keener far to feel,
He nursed the pinion which impell'd the steel;
While the same plumage that had warm'd his nest
Drank the last life-drop of his bleeding breast."

THE WAY STEEL IS MADE IN JERSEY CITY.

AMONG our readers those who live in this city know very well that Jersey City is a suburb of New York, lying on the west bank of the Hudson, or North River, which bounds this city on the west. Among the numerous manufactories of Jersey City are the steel works of James R. Thompson and Co. They are situated in Warren Street, and contain thirty-two furnaces for melting steel, with a powerful steam-engine, tilt-hammers, rolls, shears, and all the necessary appliances for bringing the metal into the proper form for market. At these works the steel is cemented and melted at the same heat, the whole operation occupying only two and a half hours. Plumbago crucibles, made by one of the owners of the works (Dr. Gautier), are filled with a mixture of wrought iron, steel, and charcoal, covered with a loose lid, and set in furnaces, where they are subject to an intense heat till the iron is converted into steel, and the steel is melted, when the metal is run into ingots in cast-iron moulds. Each crucible or pot holds about 60 lb. of metal. It is filled with punchings of boiler-plate and other kinds of scrap, with five to fifteen per cent. of steel, and a small quantity of pulverised charcoal, the proportion of steel and charcoal varying with the quantity of metal which it is desired to produce. The furnace looks like a simple cubical excavation dug in the ground, its dimensions being about 2½ ft. in all directions. It is, however, a carefully built structure, with a grate and air passage at the bottom, with sides of fire-brick, and with a flue to lead off the smoke. The furnaces are ranged in two rows, one on each side of the steam-boiler, and the flues lead under the boiler, so that the steam is made by waste heat from the furnaces. Each crucible holds four pots, and for melting the steel these are buried completely in anthracite coal. The grate is first covered with coal to the depth of about 8 in., the pots are then set in, a wheelbarrow-load of coal is shovelled into the furnace, so as to surround and cover the pots, the top of the furnace is closed with a slab of fire-brick, and a powerful blast of air is driven through the fuel for two and a half hours, when the iron is found to be converted into steel, the metal is melted, and the whole mass is mingled homogeneously together. The furnace is now uncovered, and a workman, having his hands and legs protected from the heat by bandages of wet canvas, seizes a pot with a long pair of tongs fitted to grasp it, and lifting it out, carries it back a few steps to the mould. Here another workman grasps the pot sideways with a pair of differently-shaped tongs, and pours its glowing contents into the mould. The moulds are set on end, and the ingots are some 4 in. in width, by 2½ in. in thickness, and 15 in. in length, though the form varies somewhat with that of the finished bar or rod for which they are designed. After the ingots are cast they are allowed to cool, and then, for hammering and rolling, they are re-heated in a reverberatory furnace. This cooling and heating is found necessary to give the best internal structure to the steel. It seems, at first, a contradiction that heat should take carbon out of iron and combine it with oxygen, and then that heat should take carbon from oxygen and restore it to the iron. To make wrought iron from cast iron the metal is melted and exposed to a current of air, when the carbon leaves the iron and combines with the oxygen of the atmosphere; then, to return carbon to wrought iron, so as to convert it to steel, the metal is packed in a pot with charcoal and heated. Though we are not aware that any writer on the subject takes this view, it seems to us impossible to doubt that in making steel the carbon combines with oxygen before it combines with the iron. It is a maxim that solids exert no chemical action upon each other: either the iron or the carbon must be in either the liquid or the gaseous state before they can enter into the combination. Though the metal in these pots is melted, the fusion must take place after the iron is converted into steel. If free carbon can be either fused or volatilised it must be at a temperature higher than that of these steel pots, while it would combine with the oxygen present in the interstices so soon as the temperature had risen to that of red heat. This combination would produce either carbonic oxide or carbonic acid, depending upon the proportion of air and charcoal in the pot—in the actual conditions, probably nearly always carbonic oxide. This would instantly take the gaseous form, and would be diffused through all portions of the vessel, coming in contact with all parts of the metal surface. We can conceive of no way in which iron, in these circumstances, can obtain the carbon to change it into steel, except by the decomposition of carbonic oxide.—*Scientific American.*

ONE OF THE LAUNDRIES IN THE PEABODY BUILDINGS.

Workmen's Homes dependent on Workmen's Trains.

It is education to live in a good house. A man may be bad in a good house; but he who is bad in a good house will be worse in a bad one. A few rooms and a generally dismal abode affect the manners and the mind. How can a family be good-tempered that is always falling over one another? Sir John M'Neil said, wisely, at the last meeting of the Social Science Association, at Edinburgh, that houses containing three rooms were houses of an "immoral construction." This was the first time the right phrase had been used. It was philosophy in an epithet. No one had before marked by an expressive term how much modes of living have to do with morals. In Scotland, as in England, there are an enormous number of houses, so small and so crowded, that young and old of both sexes have to live and sleep in the same room. There cannot be health under such circumstances. But this is not the worst evil—there can be no delicacy, no refinement, no purity of feeling under this state of things. Decency of thought and act is impossible. The very instinct of decency is destroyed. Nor does the calamity of manners end here. Irritability is produced, not only by bad air, which affects the nerves, but by ceaseless contact of persons and tongues, which engenders ill-will, hatred, quarrels without end, offences which are never forgotten and never forgiven. Domestic estrangements grow up amongst those most nearly allied by blood, and who should be attached by unchanging affection. People who seldom meet seldom quarrel. The glad feelings of sympathy and society are not exhausted in a short time. The middle and upper classes, who are enabled to live in large houses, enjoy far more family affection than the poor; not because they have more loving natures than the poorer classes, but because they have separate rooms in which they can live alone so long as they prefer it, and can come down to the breakfast-room or dining-room, or parlour, when refreshment or recreation is required, and retire when it suits their taste or humour. But in small houses, where all the members of a family are daily and hourly hustling each other; where every plaything of the children and every piece of property of the adults is accessible to all; where dirt, din, and discomfort constantly reign; where escape is out of the question and privacy impossible; where there is no place to retire to, except into the street—how can kind feelings, respectful manners, and the fine charm of deference, which lies at the bottom of all true politeness, exist or grow under such conditions of life? As the Earl of Shaftesbury, in a great, a wise, and valuable speech, delivered some four years ago, at Liverpool, seemed to admit, morality has its material conditions, which must precede those of a higher kind.

The plain, and now well-known and widely-recognised necessities of house-life, point to a new order of habitations and conditions of living in our towns and cities. An earnest public writer, one of the Clinton family, a cousin of the late Duke of Newcastle, has long endeavoured to meet this evil by the institution of Associated Homes. Mr. Hawkes Smith, of Birmingham, the father of the eminent Parliamentary barrister, Mr. Toulmin Smith, was the earliest English practical advocate of the great domestic change happily now inevitable. Some additions, not yet suggested by Mr. Peabody, might be made to those merciful erections which his wealth is providing, which would immensely improve their uses. Owing to cost of space, all the rooms in our model lodging-houses are few and small—we speak of those appropriated to one family. The great family necessity is larger rooms, and more of them, in the dwelling-houses of the working class. This is impossible, with prevailing notions, in our crowded towns. The institution of common rooms, common refectories, large class-rooms for little ones, smoking-rooms, and news-rooms, in connection with working-men's block-houses, are quite beyond any benevolent millionaire or public company in England to institute. In any of the existing blocks there might be, on the same acreage, twice the number of floors. We might, by the judicious use of iron, as Mr. W. Bridges Adams (the most fruitful in resources of all modern civil engineers) has shown, have houses ten stories and twelve stories high. It would do the young people good to run up the stairs, and Mater and Pater familias could be raised by hoists every three minutes. We showed, in an early number of this journal, what has been done at Guise, near St. Quentin's, in France. They do "manage these things"—as they do some others since Laurence Sterne's days—"better in France." There are dwellings for workmen, with five rooms and a kitchen, cupboards, closets, and conveniencies innumerable; balconies round the houses, nurseries a princess would be glad to rear her children in, billiards, newspapers, doctors, musicians, and education at hand. There association is studied as a fine-art—living is reduced to a science. In England we give twenty families four houses among them, six square feet of damp yard for a playground, a joint closet, and a party pump, a beer-shop at the corner of the entry, a poor-house and a gaol, just as incentives to ambition; and we call this taking care of the working classes. There are districts in every town of which this is no exaggeration. But M. Godin, of Guise, who has so wisely, and bountifully, and economically, and mercifully allowed all this, is a disciple of Fourier. He learned wisdom in that thoughtful and generous school. But these are names we never mention in England. The great thinker was a doctrinaire; and we do not like doctrinairism here.

We must get out of it how we can. We shall get out of it in time. Working men will have an opinion of their own one day. Who knows but they may be set thinking to some purpose? One publication or another will effect a change in due course. There is no reason why they should be the lower class in habits, in refinement, in delicacy, in education, in manners, or in comfort. If they knew their own power, and had the sense to act in concert, they would soon amend all this. At present, they must look to the railways for help. Mr. M'C. Torrens has made a serviceable, much-needed, and long-needed motion in the House of Commons this week, with a view to the provision of better dwellings for artisans and labourers. Then we have had the short and maiden speech by Thomas Hughes, M.P., in the House of Commons, against one of the proposed metropolitan railways, destined to cut fifteen acres off Hampstead Heath. It is a great thing to preserve the commons we have for the people. Instead of the railway cutting the Heath off, Mr. Hughes cut the railway off. It is the right thing to keep the railways off the commons; but the railways may do good service to the working class. If the new companies wish public opinion in their favour, let them at once provide to run carriages at low fares—comfortable carriages, not horse-boxes or cattle-pens—for working men. Not, as now, one carriage at six o'clock in the morning, but a carriage every time a train runs, from early morning till late at night. Houses are required in the suburbs, where space is cheaper, and where roomy, wholesome houses can be erected, and let at a cheap rental, with a railway free ticket

THE PEABODY BUILDINGS, SHOREDITCH.

for the occupier. Houses of a *moral* construction must be put up, and access to them must be easy, constant, cheap, and at all hours. Railways alone can make this possible—companies can make money by it. If they do it in London, it will have to be done elsewhere. It will, no doubt, alter the whole railway system of management throughout the country; but, as it will alter it for the better, the change cannot be made too soon. A great reformer, who lived before his time, and who did much good in his day, once proposed that all railway transit should be free. The Chancellor of the Exchequer has yet to be born who will think of this; but the finance minister who does so will fill his exchequer, and develop the resources of the country enormously. We have seen the abolition of turnpikes already. That piece of wisdom took the nation 800 years to learn. It is but an inevitable sequence of Free Trade. It rests on the same principle as that on which national free transit is founded. This will come one day. In the meantime, we ask for cheap fares for the working class. They cannot come too early. They are already long overdue.

The Management of the Peabody Buildings.

The English people were gratified to learn, some time ago, that an American gentleman, Mr. Peabody, had given the great sum of £150,000 for the purpose of erecting wholesome dwellings for the working classes. There was something honourable and truly American in the idea of thus thinking of the social condition of the democracy. Great as this gift was, Mr. Peabody has, within a few weeks, increased it by adding another £100,000 to it, making a quarter of a million of money devoted to promoting the household comforts of the poor and industrious residents of our large metropolitan districts. Quietly and unostentatiously this immense sum has been "gifted," as is expressively said in Scotland.

SUITE OF ROOMS.

The decision and merit of this bequest are much enhanced by being made in the lifetime of the donor. No ambiguously-worded will, left to be disputed in law courts after his death, with the chance of the donor's aims being explained away, and the certainty of a considerable portion of the bequest being dissipated in legal fees, mars his noble design. He gives absolutely; and while he lives the character of his bequest is fixed. Lord Stanley, and, if we remember rightly, Mr. Alderman Waterlow—himself a benefactor of the working class in a similar and lesser way—are members of the directory for the application of the Peabody Funds: and already there stands in Shoreditch the first erection of workmen's homes thus provided for.

Undoubtedly, Shoreditch is a well-chosen district, in which to commence realising the Peabody benefaction. Millions of money might be usefully employed before the working population will be wholesomely housed. The whole parish needs to be recast and rebuilt. There is scarcely a healthy street in it, and very few houses in which any human beings who understood the conditions of health would choose to live. "Necessity compels" might be written over most of the houses and alleys. Happily, it does not go hard with the majority to live there—they are pretty well used to it—but the sanitary and moral philosopher can see that physical and

ethical results of the state of things prevailing there, and is as anxious to see it amended as though the residents were all sensible of them too.

In walking over the district—by no means a refreshing excursion—in order to visit the first Peabody erection of Buildings, and to ascertain what ground there was, if any, for the recent letters of complaint which have appeared in these columns, I selected, in the widest and most open street in Shoreditch, the most respectable eating-house visible. Portions of roast fowl and fresh-looking rolls shone temptingly in the window. Looking at the interior, the proprietor appeared there resplendent in a massive gold watch-guard, or what was evidently supposed by the wearer to be such, with appendages of a startling description. Unwisely concluding, or rather hoping, that this external magnificence at least implied digestible chicken, an approach was made to the counter. A nearer inspection corrected this illusion, and a ham sandwich was ventured upon. Pickles were offered as an accompaniment and declined; but a less suspicious customer accepted them. The proprietor with the jewels found his jar low, and at once took down a large stone vessel, in which his treasure of pickled cabbage reposed; and straightway thrust his hand in and brought some up, and stuffed them into the smaller jar with his fingers. This operation, which he repeated several times, had the effect—vinegar being a detergent—of cleaning his hands without at all improving the colour of the vinegar, which, when he had done extracting cabbage, he poured into the smaller jar, and handed it to his customer for use. If this be an example of the "manners and customs" of the retail inhabitants in an open shop, in the most respectable part of Shoreditch, what may we not suppose to occur in the poorer shops of humbler quarters? It is impossible not to be impressed with the vigour of appetite of the out-door Shoreditchonians.

The Peabody Buildings stand in a newly-formed street near the Shoreditch Railway Station. As the street (Commercial Street) has width, and the neighbourhood is comparatively open, there was reason for choosing this spot. Unfortunately, right opposite is the Cambridge Music Hall; and from all the front windows of the Peabody Homes the inmates look down on what it can do no one good to see. The Peabody Buildings is a substantial brick erection, not without an air of stateliness, but without any distinguishing character as a whole. It would be pleasant and gratifying to think that some external form had been chosen for the buildings by which every succeeding erection could be recognised, and connected at sight with the noble donor's memory. No portico, or conspicuous office of inquiry, marks the place; no name or symbol appears to distinguish the place from surrounding buildings; inquiry is necessary to identify it. In the interior is an irregular and somewhat small courtyard, paved with flag-stones, dry and clean. This is the play-ground of the children. But there is nothing to play with—no benches, poles, or swinging-posts; mere flag-stone space, and nothing more. The yard, however, is a luxury in Shoreditch for poor children, and this must not be forgotten, But surely a little thought and a little cost would have added to the happiness, pastime, and health of the little ones. The designer of the Buildings must have forgotten that children have legs and arms. Having nothing to use but their lungs, they create a din that would make Babel blush.

All the landing-places on the staircases look into the yard. There is no other view than the backs of opposite houses. There is no gallery, back or front, on which wives could sit in summer in the sun, or husbands smoke an evening pipe, instead of going to the ale-house. A minor addition to the first cost would have created this means of enjoyment, and made the back houses superior to the front without galleries. At present, in all these block buildings, there is a perpetual struggle on the part of the back tenants to get into the front houses. Mr. H. Roberts, the architect who designed the Model Cottages for the late Prince Albert, has introduced the "glory of a gallery" in some of his erections. In this country, so distinguished for its home life, architects do less than in any country to gratify this sacred taste.

In this building the office of the superintendent is a cold, tame room, adorned with no bust or portrait of the generous founder of the place—nothing to keep alive in the minds of the residents the pleasant and grateful memory of him. A more prosaic, or more business-like commemoration of a public gift was never attempted than is seen here. Why was there not a cosy little Hall of Inquiry instituted—a pleasant-minded *concierge* established—which adds so much to the comfort and happiness of a French court of houses? We might borrow this little feature from our French neighbours; and if we put French families in the superintendent's house in these buildings it would be an immense advantage, until our own countrymen learn that spontaneous politeness of conduct which is already in their hearts, but so seldom gets into their manners.

But a truce to criticism where there is really so much to praise. Though there is nothing picturesque—not a feature of homely beauty, such as a mason, were he so minded, could charm the inmate with—in these buildings, the architect has done wonders for the health and comfort of the residents. The stairs are all wide, the corridors are all spacious, the walls are all whitewashed, the floors and stairs are all clean; the closets are numerous, private and convenient, light, and spacious; the lavatories are ample and accessible—closets and lavatories for men and women are separate and far apart. There is neither damp nor dirt, nor hole, nor smell. All is sweetness, space, and purity. The Peabody Buildings are a sanitary Paradise in Shoreditch. Not like the St. Pancras Model Lodgings, where the stairs are narrow, and one house seems to inhale the atmosphere of another: here the houses are well separated, and down the wide passages between them fresh air traverses. The corridors of Somerset House, in the Strand, are not so breezy, light, and fresh. Ungrudging praise is due to the directory who sanctioned or inspired this, and to the architect who contrived it.

The ventilation of every house and room is beyond all praise. Around the upper portion of every house, fresh air has constant admission, and sweeps the ceiling. The smallest rooms are fresher than the largest constructed in ordinary houses. Hardly any gentleman in London is so secure from disease in his home as are these Peabodians. In not one house in 10,000 in the metropolis is ventilation so perfectly, so simply, and so completely provided for. Some houses are said to be fire-proof: these houses are plague-proof.

The uppermost stories of all the flats are lofty, pleasant-looking, breezy drying-rooms. No hideous flapping of clothes on lines disfigures the yard. The washing-houses are all on this topmost floor. Each tenant has a copper, and a lead-lined washing trough. A mangle and wringing machine stands in each wash-house for use. The very wash-house, which is ever the damp, dismal, underground den in houses of the poor, sending its suds, steam, and discomfort up into everybody's face, is here at, the building-top, out of sight of the family, and cozy, light, and cheerful as a lady's kitchen, and healthier than many drawing-rooms. On this lofty flat are bath-rooms for men and for women, separate and remote from each other.

The fire-grates may be too large for some families; the ovens too small; the heat of the fire, owing to defective construction of the grate, may go too much up the chimney; the walls, being merely whitewashed bricks, may wear a poorhouse or gaol-like look. There being no supply of hot water for the baths, is almost tantamount to there being no baths at all. But these are small matters compared with the great advantage of sweet, cheap, healthy homes, with many cheerful and invaluable accommodations. Tenants owe duties to trustees, as well as trustees duties to tenants. Tenants should not complain too much. A brick wall, which a whitewash brush will always keep sweet and clean is far preferable to bug-breeding paper. An army of these red-jackets would produce more annoyance than a dozen military superintendents. A few fire-balls, bought by the tenant, would enable him to regulate his fire. Some of the tenants had actually pasted paper over every ventilating aperture in their rooms, on the ground that the air was cold. The tenants who made the most complaints were those who had shut out the air. Fresh air purifies the temper, as well as the house. One complaint is more valid, and it is one which might be remedied. There is no available school for the numerous children living in the Buildings. Mr. Peabody has foreseen this want when making his new donation. Is it too late to repair the deficiency at Shoreditch?

The noblemen and gentlemen who are the trustees of these Buildings are too high in station, and too fully occupied, to be able to give time to the detail management of this great series of erections. Mr. Peabody has done quite enough in giving his money. He should not be pestered with the complaints of tenants. Yet steps should be taken that complaints should have attention and remedy when they arise. Could there not be instituted an office of general inquiry for the public, who are interested in this noble Peabody Gift? Could not a complaint, respectfully worded, be lodged there by the tenants? Something of the kind would soon put an end to all complaints, afford justice, create confidence, inspire respect and gratitude, and render these places what Mr. Peabody desires them to be—communities where freedom, independence, neighbourliness, health, and social enjoyment shall abound. We have good reason to believe that some of the "grievances" recently made public were unfounded; and are assured on competent authority that the alleged notice to quit to complaining occupants is contrary to the fact.

Mr. Peabody's letter, just published, defining the objects he has in view in his additional gift of £100,000, show that he has ideas of the comfort, freedom, welfare, and pleasure of the residents in his houses, which indicate a liberality of mind, as splendid as the liberality of his great donation to the industrious workmen of London. We may, in this Journal, afford to working men the protection which any publicity of ours can secure for them, in case they have grounds of complaint; but while we do this, or take the liberty of suggesting any improvements we may think reasonable, in administering this important trust, we shall as earnestly and as frankly counsel the tenants to study all the means by which they can co-operate with the trustees in giving effect to the generous intentions of the donor; and we shall be glad to believe that his Excellency the American Minister will always be able to report home, that the working classes of the metropolis of England appreciate and profit by the social comforts provided for them by the liberality and cosmopolitan spirit of a distinguished American citizen.

A Special Visitor.

Letters from Lancashire, by a Lancashire Lad.

V.—In and about a Workhouse.

For some time past very considerable attention has been paid to the treatment of paupers, casual and others, in our metropolitan workhouses. Every now and then a case is made public in the newspapers which causes the heart to beat quicker than usual. The articles of the "Amateur Casual," in the *Pall Mall Gazette*, have shown how much of the horrible may be found in our midst. Others have tried to follow that writer in depicting what is picturesque in certain parts of our Poor Law system.

The workhouse with which I am most familiar is the Manchester new one, situated at Crampsall, some three miles distant from the centre of the great town. It stands on the brow of a hill, and covers about four acres of ground. It is an immense place, and has accommodation for nearly 2,000 inhabitants. The buildings are in three divisions. The outer one, at which entrance is obtained, has a lodge at one side of the great gate, and a machine-room at the other. In this same section of buildings are the probationary wards—one for males, and the other for females. It is noticeable that the males and females, all through, occupy opposite sides of the house. Supposing that to-night some poor fellow should go up to the "house" with his order from the relieving officer, he would be admitted at the gate, sent on to the offices in the front of the middle division of the buildings, and then all particulars respecting him would be taken down in writing, and he would be sent back to the probationary ward. Here he would be inducted into the bath-room. This is a small room in which the bath stands. There is none of the horror of making some half-dozen or more tumble into the same water—water, too, of the consistency and resemblance of mutton broth—but each in-comer has the bath refilled for himself, and can have it of the degree of heat which will please him best.

Starting from the gate, with the intention of

going through all the buildings, a stranger would have a task which would occupy much time. On the male side he would see the able-bodied men at work, some rope-opening, some picking oakum, some few cobbling or joinering, some mat-making, and others grinding corn at hand-mills. He could not help noting that, in this workhouse at least, there seems to be very great care taken that everything requisite to health shall be properly attended to. Everywhere scrupulous cleanliness; all possible arrangements for protection from fire; and a system of thorough ventilation —all these the visitor observes, as he passes along. He incidentally obtains some notion of the way in which the officers behave to the inmates. For instance, passing along the men's workroom, I found a few old men sitting apart from those who were opening rope, and, asking the reason, was told that, having complained that the dust from the ropes affected their respiratory organs, the master had at once arranged for their oakum-picking to be done beyond range of the dust.

Passing from the men to the male children, we find a lot of them squatting on a huge table, under the superintendence of a professional tailor, who instructs them in his trade, and sets them work to do. These lads, and such men tailors who happen to be in the "house" from time to time, make up and mend all the clothing of the male inmates. A little further on, and we come to a room in which a lot of lads sit cobbling and making shoes, each at his separate stall. Here, again, the lads are under the superintendence of an expert artisan, who helps them in mending shoes for the entire establishment. From this room to the boys' school is not far. There is a schoolmaster to instruct them, and the usual paraphernalia of the schoolroom—maps, slates, and black board—hanging or standing about. On our way to this school, we turn aside to see the lads' bath-room. Here is a large plunge-bath, in which the lads delight to sprawl about; and having had their fill of that, they can move to the dressing-room adjoining, the floor of which is covered with wooden stillages, to save their young feet from the cold of the stone floor.

Crossing over to the other side of the central pile of buildings, we come to the girls' school and dining-room, and just happening to be here when the dinners come up, we have a chance of seeing how the young things take their food. The girls' dining-room, and that is the boys' too, is a long room, having tables, looking like the narrow desks which may be seen in old-fashioned schools, and each table has a long wooden seat behind it. The girls sit here, each with a tin dish before her, containing the food as apportioned to each. Dinner being eaten, the centre of the room becomes a place for play until school hours begin again. In a room near to this I found a group of some forty infants, some of them little chubby-faced things, who, happy and comfortable just now, will have a hard life-battle to fight by-and-by. They were seated in front of low forms, upon which their dinner dishes rested, and enjoyed their food as most children do.

The able-bodied women, also, in this portion of the buildings, are engaged in washing-houses, in which all sorts of modern appliances for the speedy cleansing of dirty apparel are adopted. Other women, again, are employed in a huge laundry. Young, healthy girls are to be seen in a special wash-house and laundry of their own, learning to make good washerwomen and good getters-up of linen.

In some of the upper rooms of this part of the "house" the women whose chief disease is old age are gathered together. It is very touching to see how carefully these are tended—how here and there a curtain slung across a rail shelters the entrance from cold-giving draughts; and how, in the bedrooms, over the head of nearly every bed, is a label fixed there, by order of the doctor, which tells that the woman sleeping there is to have "generous" diet. The women—such of them, at least, as are able to sit up—are sitting in Windsor chairs round cosy fires, and, though they wear the uniform workhouse clothing, recognised everywhere as the insignia of that Order of Poverty of which Douglas Jerrold wrote, it indicates that they have advanced from that lower grade of the same Order of which the insignia are—rags and their concomitants. There is every evidence that these old women appreciate the kindness which is bestowed upon them.

It is, too, in this part of the house that the nurse-children are kept. The rooms are warm, and little cribs stand about, in which some babies, having just been feeding heartily, are lying fast asleep. Here and there a little fist, about the size of a clock-hammer, lies clasped on the top of the coverlet, whilst its owner, his lips just a little apart, and his cheeks having a delicious flush of colour upon them, is, let us hope, dreaming happily. There are rooms in which children may learn to walk. In the centre of each of these rooms there is a large pen-like structure, the rails round it being just high enough to prevent a baby from tumbling over.

Having looked through this central portion of the house, we go on to the third division. This, being the most sheltered from the inclement winds, has been selected for the infirmary, or hospital, and the imbecile, epileptic, and idiot wards. This is the division of the house which I like best, although it raises the saddest feelings. Throughout the rooms here, one notices that additional care has been taken to make them as pleasant as possible. Not only are there large wooden screens covered with woodcuts from the illustrated journals placed inside each door, but on the walls are coloured pictures, most of them tastefully selected, and the subjects being in no instance of a gloomy character. In the hospital, whether it be that for men or that for women, the visitor cannot help noticing the care bestowed upon the inmates. Those suffering from different diseases are separated. In one room are a lot of children suffering from skin diseases; in another, still more children suffering from sore eyes, and for these the light has been softened by the dropping of green-striped curtains over the windows. It is pleasant to look at these little things lying in their little beds, although suffering thus. Each has a word for the master as he comes into the room; and one wee thing, lolling pettishly over the side of his bed, repeats, time after time, "*I* said good morning, sir," as though he would intimate that the master had not taken sufficient notice of him. The men and the women are, it would seem, tended as well as the children.

The epileptic and imbecile wards have now 92 patients on the male side, and 139 on the female side. A first entrance into these rooms is not so pleasant. There are few men who can look on unmoved when, for the first time, they see large numbers of their kind who exhibit in their countenances some signs of the absence of reason, or who suffer from frequent epileptic fits. Perhaps, as you pass along, you see one man lying in a fit on the floor, his head raised slightly on a cushion or pillow; or perhaps you see one, or more than one, just recovering from an attack. Just the same things are seen on the female side of these wards. Some of the patients have four, or six, or more of these fits daily. When they are not punished by their sad ailments, some little occupation is found for them. The males do a little mat-making, or open a few flocks for the stuffing of pillows. Some of them go out and do some gentle sort of work upon the farm when that is deemed beneficial. On the female side much more variety of occupation is found. Some twenty or more work frequently at shirt-making or other plain sewing; others may be seen knitting stockings, crotcheting, netting, and doing other kinds of fancy work. Some time ago my interest in this place was increased by the knowledge that the officers of the workhouse got up a series of entertainments for these imbeciles in the winter of each year. I have attended many of these, have been in the little make-shift theatre, fitted up and decorated by the officers themselves, and have seen these poor people laugh most heartily at "Box and Cox," and the "Area Belle," "Taming the Tiger," and other well-known farces, the parts in each piece being performed by workhouse officials. Concerts, too, have been given, the officers obtaining the assistance of friends residing in or near Manchester. At times, too, some of our popular Lancastrian authors have contributed largely to the enjoyment of these inmates by reciting some of their own stories or songs. Each Christmas a very grand ball is given. Long before the time the female patients prepare their dresses, some of the material being lent for the occasion, and some being paid for from a private fund, the result chiefly of extra labour on the part of the women themselves. This ball has become quite an institution, and many friends go up to witness the doings. The wards are decorated very elaborately, and one is amused at noticing that female ingenuity has been equal to using tissue-paper in the decoration of the person as well as in the decoration of the room.

Let me briefly refer to the general arrangements of the place. In describing the central pile of buildings, I forgot to say that *there* the church was situated, at which the chaplain preaches to the inmates and officers twice each Sunday, and reads prayers, at stated times, during the week. There is also an arrangement whereby the Roman Catholic inmates have a chapel to themselves, and services led by their own priests. The whole time of the chaplain is occupied by attending to the spiritual needs of the inmates, and I might say here that, during the present winter, he has entertained them with a series of concerts of sacred music. There is, too, a resident doctor, whose perpetual presence is of very great advantage in such an institution as this. There are more than thirty officers, and each of these has his or her duties so defined that unpleasant collision is avoided. There are night officers for the hospital, the imbecile wards, and the wards in which young children are. One of the busiest parts of the whole place is that where the cooking and the distribution of food takes place. The huge boilers, and their white-aproned attendants, have plenty of work to do; and butcher, and baker, and other tradesmen, have to send large supplies to this monster house. The consumption in one very recent week was as follows:—Bread, 4,726 lbs.; oatmeal, 1,698 lbs.; India meal, 538 lbs. (to mix with oatmeal); rice, 82 lbs.; treacle, 50 lbs.; coarse meat, 1,157 lbs.; fine meat, 320 lbs.; potatoes, 20 loads; peas, 50 quarts; tea, 35 lbs.; sugar, 226 lbs.; butter, 220 lbs.; sweet milk, 206 dozen quarts; new milk, 42 dozen quarts; beer, 48 gallons; porter, 176 pints. Besides these articles there were numerous others: wines and spirits for the sick, eggs, arrowroot, &c. The diet would seem to be ample, and the doctor has the power to order anything which his patients may need. He has his drugs in the house, and these are in the charge of the dispenser of medicines.

I should do wrong if I did not conclude with a word of praise to the officers. The master and matron, and those who are under them, have shown so much sympathy with those who are most helpless, that they deserve more praise than I can give. The guardians are aware of the character of their servants, and, I believe, will show that they can rightly appreciate them. Not content with the present means for the outdoor recreation of the imbecile men and lads, the guardians are about laying out a large piece of ground for cricketing, foot-ball, &c. The women have a large and well-sheltered recreation ground, with a huge grass-covered hillock in the centre, from which they may view the country round.

THE TEXTILE MANUFACTURES OF AMERICA.

Lowell's 33 cotton mills employ 948 males and 1,650 females, and last year produced 7,125,953 dols. worth of fabrics; two calico and muslin-de-laine mills employed 188 males and 11 females, and turned out 3,167,122 dols. worth of fabrics; five carpet mills employed 382 males and 573 females, and turned out 3,570,435 dols. worth of carpeting.

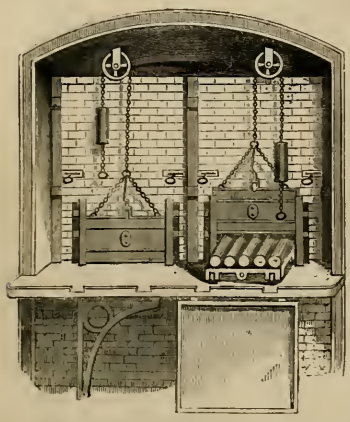
Fall River, Massachusetts, has 15 cotton mills, having 241,218 spindles, consuming 5,548,044 lbs. of cotton, and employing 2,654 hands; 2 establishments for calico printing, producing 5,616,000 yards, and employing 488 hands; 3 manufactories of spool cotton, employing 217 hands; 1 woollen mill, with 6 sets of machinery, consuming 125,000 lbs. of scoured wool, turning out 126,300 yards of cashmeres, and employing 103 hands; 1 linen mill, producing 1,216,464 yards of crash, and employing 214 hands; 1 rolling, slitting, and nail mill, using 490,000 dols. worth of stock, manufacturing 2,656 tons, and employing 265 hands; 2 furnaces for pig iron, turning out 837 tons, and employing 63 hands; 3 establishments for manufacturing cotton and woollen machinery, turning out 103,500 dols. worth, and employing 103 hands; 2 establishments for steam boilers and engines, turning out 16 engines, and employing 30 hands; 7 establishments for manufacturing clothing, employing 112 hands, and an indefinite number of smaller enterprises, that give life and animation to a town, and keep busily employed an industrious population.

Great Suspension-bridge. — An American paper states that the Cincinnati bridge about to be suspended across the Ohio River will be the longest in the world. Its total span will be 1,057 yards. The massive stone piers tower 110 feet over the floor of the bridge.

*Coin, from the Crucible to the Press.**

In the accompanying illustration, which gives an accurate idea of the furnaces used for annealing, the state of things we have partially described in relation to it will be seen. One oven is shown closed, as having received its charge of cells and bars; the other partially open, and just about to take in that which is shown at its mouth. The fires are placed in the rear of the ovens, and are governed as to the extent of heat they give out—and which must never reach the fusing point—by an excellent arrangement of dampers, and a self-feeding apparatus. About twenty or thirty minutes suffice for the thorough heating of the cells with their rich contents; and then they are withdrawn to make room for others.

The covers are removed, and the bars are dropped, while hot, into a cold water bath, which



A PAIR OF MINT ANNEALING FURNACES.

has the effect of completing the softening process to the exact degree required.

Now the smaller mills, arranged on similar principles to those described in reference to the "breaking-down" apparatus, are brought into requisition. Lamination, and consequent elongation and attenuity of the bars, follows in rapid succession; and instead of strips or fillets, we soon have ribands of gold, thin as the ashen wand of a harlequin, and almost as flexible. It now becomes essential to treat them with extreme care; for it is a *sine quâ non* that they be brought to a uniform thickness. The constant application to their edges of a graduated steel gauge, as they leave the smaller and more delicately-fitted mills, and the gentlest of gentle squeezings between the rolls, enable the workmen to effect this object pretty accurately. Another operation must be performed, nevertheless, before an absolute uniformity of thickness throughout the whole of the ribands can be obtained. Of that operation we shall speak presently, for it is effected in another room. So far as the great rolling-room is concerned, its mission lies in the production of *gold, silver,* or *bronze* ribands—as it may happen—of tolerably equal thickness; and that, we have seen, has been accomplished in respect of the bars whose career on the road to sovereignty we are tracing.

Now, therefore, commences the weighing up of ribands, cuttings, clippings, ends, splinters, *débris,* and dust, and the comparing of the morning's out-going with the evening's in-coming metal. Usually these two agree; and while the ribands are next morning sent forward to the adjusting-room, the scrap is returned to the melting-house. The officer of the adjusting-department, instead of measuring out his ribands, as a draper would do, weighs them out to his customers, or workpeople, rather—for weighing is the coiners' "guide, philosopher, and friend;" and straightway they are conveyed to the equaliser, or "draw-bench," as it is technically called.

This apparatus consists of a long table of iron, over the upper surface of which traverse longitudinally and continuously four chains, formed of gun-metal and wrought iron. The links of these endless chains—for such they really are—fit exactly certain projections on a wheel working in a tunnel below, and propelled by steam-power. The heads of the tables are simply boxes for the reception and retention of four pairs of hardened, truly-turned, and highly-polished steel cylinders, fixed in pairs, one above the other. In appearance these cylinders are models of the large rolls, on a scale of an inch to the foot. They do not revolve as the rolls do, however, but are firmly screwed into recesses of iron fitting their circumferences, supporting them from end to end, and preventing any tendency to elasticity. Between these steel adjusters all ribands have to be drawn, for the removal of inequalities in their thickness. This process, indeed, resembles wire-drawing in its principle; and no doubt the idea of performing it was gained from that ancient and ingenious operation.

Above each of the travelling-chains is placed a pair of travelling-nippers, having steel teeth, and so constructed as to be readily attached to or detached from the chain. These parts of the contrivance are known at the Mint as "dogs;" and, unquestionably, they bite sharply, and hold tight when they are once fairly set upon their victims—gold or silver ribands—and they never unclose their teeth until they are disengaged from their several chains. The ribands of gold, before being put into the draw-bench, have their ends compressed slightly at a machine adjacent to it, so as to pass between the cylinders readily, and thus allow the dog to bite them as they project on the opposite side. A simple arrangement opens the dog's mouth, and, literally, the pulling the chain gives to its tail causes its teeth to indent themselves in the gold, and tug it by main strength between the bright and true surfaces of the steel cylinders.

The cylinders themselves are adjustable as to distance by screws and *indices,* and should, of course, be secured at that point which leaves a space between them agreeing with the thickness of metal required for the coin to be manufactured. In order to be assured that this is the case, a workman, known as the "tryer," is stationed close to the draw-bench with hand-cutting punches, and tiny pairs of apothecaries' scales, for punching blanks from the ribands here and there throughout their length, and weighing them. He knows that a piece of gold or silver of a given diameter and thickness must be of a certain weight within the veriest trifle, and thus he constantly tests the drawn-out ribands. Assured that the whole batch, after being drawn, are of the proper thickness—neither too thick, so as to yield heavy blanks, nor too thin, so as to produce light ones—the ribands are dispatched to the cutting-out room.

* Continued from page 177.

Things Talked About.

Next to the Irish difficulty and the ravages of the cattle plague, the claims of working men to share not only in the government of the country, but to enjoy their full proportion of the benefits which the advance of practical science proffers to the whole body politic, are occupying the attention of the Imperial Parliament. The new metropolitan members are especially doing their duty, and fulfilling the expectations indulged in when such men as Mr. Torrens and Mr. T. Hughes were returned to Parliament. The former gentleman has manfully taken in hand one of the very greatest questions of the day—a question to which the Working Man has, since its first issue, especially devoted itself—the provision of fitting house accommodation for the working classes. On Tuesday, the 20th ult., he obtained permission to bring in a bill on the subject, the object being to enable the Home Office, on the requisition of any corporate body, or any twenty persons residing in one district, to order an inspection of any over-crowded or disease-breeding locality, and that the Public Loan commission should advance the money necessary for rebuilding or undertaking proper sanitary measures. Mr. Torrens's bill differs from that introduced by Mr. Childers, the Under Secretary of State for the Home Department, described by us last week, inasmuch as the latter is merely permissive, while the bill introduced by the member for Finsbury is much more stringent in its operation.

Mr. Thomas Hughes, the member for Lambeth, has announced in the House that he shall oppose every metropolitan bill which ignores the claims of the poor man to compensation, when the companies ruthlessly turn them out of house and home. We are glad to see that Mr. Hughes's determination was sympathised with by members who by no means generally share his political opinions. It will come to this, and the sooner the better, that every new railway or public improvement scheme must include the provision of suitable dwellings for the working classes displaced, and that the right of weekly tenants to compensation—a right at present ignored—will be acknowledged.

Mr. Clay, the member for Hull, has made an attempt, by the introduction of a bill, to bind the House to an expression of opinion on the subject of an intelligence franchise, and so influence the Governmental measure of Reform. Mr. Clay's plan is, that any man of full age, and with no disability, not having a vote, may submit to an examination by the Civil Service Commissioners, on whose certificate of competency in reading, writing, and elementary arithmetic he would be placed on the registry. But he must have resided six months in one place before going up for examination, so as to have acquired a certain character for stability. This measure, if passed, would practically open the franchise to the great majority of working men. There is little chance of its being passed; but there is no doubt that ministers are cautiously feeling their way to a measure which shall give the labouring classes a much greater share in the representation than they at present possess; and the debate on Mr. Clay's bill will doubtless bring forth expressions of opinion which will materially strengthen their hands.

The Dorsetshire labourers are beginning to contradict the statements of the Earl of Shaftesbury as to their comfortable condition. Whatever the noble earl may think of the matter, the labourers themselves are not so easily satisfied with their wages, food, and lodgings. According to letters of two of the men, which have found their way into the newspapers, "Lord Shaftesbury knows little or nothing about his own people, and has understated the hours of work and overstated its profits by one-half." The "happy rustics," in clean smock-frocks, sporting on the village green, are, it seems, a pretty fiction, and the real Dorsetshire labourer is, after all, a wretched, half-starved, ill-lodged, poor fellow, hovering on the very verge of actual destitution.

We hear good accounts of the state of trade in the iron and coal districts of South Wales. Continental engineers, we know, are competing with English firms, and sometimes successfully; but we are told, by way of compensation, that they are resorting with increased eagerness to South Wales for railway iron. So, in the end, this country will not be very much the worse. In the month of January alone 4,000 tons were shipped to Alexandria. Foreign orders for steam coal, too, are coming in thick and fast.

But if we get experience in diminution of trade in the unmanufactured article, it behoves our manufacturers to see that foreign houses do not injure our *prestige* as manufacturers. The French ironmasters are very prosperous just now, and the cotton and woollen manufacturers are very brisk, scarcely able, indeed, to meet orders. In other times, England and France were rivals in another fashion. Our contests now are in the interests of industry and the arts of peace.

Under these circumstances, it must be a matter of regret that iron shipbuilding on the Tyne and Tees is at present nearly at a stand-still, owing to a dispute connected with the nine hours' movement. The men are firm in their demands, and the employers appear to be equally unyielding. A lock-out is threatened.

While referring to the subject of iron shipbuilding, we may notice that the strange-looking "cigar ship," which has been for a long time past one of the sights of the Thames, was launched on Monday, the 19th ult. It is the fourth of the kind which has been constructed, but the first one built in England. Messrs. Winans, the patentees of the design, are sanguine as to the speed and safety of these curious vessels, and their value especially in carrying mails. The *Ross Winans*—the name given to the new ship—is 256 feet long, and only 16 feet wide, and is plated with iron and steel. She is divided into 26 water-tight compartments, and affords good accommodation for passengers. How she will behave on the broad Atlantic waves is a question which experience alone can decide.

The anniversary dinner of the Association of Foremen Engineers (an institution which we recently described in our columns) was attended by several engineers of eminence. Mr. Samuda, M.P., and other gentlemen, confirmed the remarks we have made above, by saying that, in face of "the great competition with English engineers that is springing up on the Continent, when the French and Belgians are beginning to send locomotives and railway iron to England, it is time for practical men to be on the alert."

The great Manchester firm of Greening and Company (a limited company), manufacturers of iron and wire fences, gates, &c., have resolved to allow their clerks, foremen, and workpeople a certain share of the profits under certain conditions, one of which is—"Whenever the net profits in any one half-year exceed 7½ per cent. upon the gross paid-up capital of the company, then, for every additional 2½ per cent. dividend or bonus paid to the shareholders upon their capital, a dividend or bonus of 2½ per cent. shall be paid to every person employed by the company upon the amount of wages earned by him or her in the same half-year: provided always, that such participation in profits shall not give

to any of the workpeople (not being shareholders) any right to interfere in any way in the management of the company's business, nor shall it render them liable to any debts or responsibilities incurred by the company." Provision is also made for the workpeople becoming shareholders (of course, with a voice in the management then) on easy terms. This is almost a step towards Co-operation.

Our attention has been called to the West London Youths' Institute, Queen's Road, Bayswater, where, for a very moderate subscription, a lad may enjoy the advantages of several classes, the use of a lending library and reading-room, a gymnasium, and the privilege of attending lectures. Mr. Russell Gurney, the Recorder of London, and one of the Jamaica Commissioners, is the president. Mr. C. Baker, one of the honorary secretaries, writes to us:—"Several of us have been working for years at these institutes for working youths, and they have proved most successful." We are very glad to hear it, and trust their excellent example may be followed. Dr. Hook, the Dean of Chichester, presided at the recent annual meeting, when a number of prizes were distributed.

The friends of Co-operation owe it to the cause they advocate to guard the public against imposition. It would seem that some so-called Co-operative Stores have been started, and that numerous poor persons have suffered in consequence. One such case came before the magistrate at the Thames Police Court, on Wednesday last, when, to quote the police report, "a very poor, thinly-clad, and wretched-looking woman, named Mary Anne Loane, came before Mr. Paget to complain that she had been defrauded of 20s. by the St. George Co-operative Provident and Industrious Society (Limited) Stores, 20, John Street, Cannon Street Road East; 1, Catherine Street, Commercial Road East; store and bakery, 4, John Street, Old Gravel Lane, St. George's-in-the-East. It was explained that the poor woman had made a similar application to Mr. Partridge on a former occasion, when that gentleman advised her to make a formal demand to the so-called Co-operative Society, in accordance with one of its printed rules. The applicant stated now that this application too had been fruitless. Mr. Paget having looked over the rules of the society in question, stated his great regret that magisterial jurisdiction did not extend to such an affair as the present. Several other poor people who had invested small sums in the society, were waiting with great anxiety the magistrate's decision." We should like to hear something more respecting this "Co-operative Society," and will willingly afford room for a valid explanation on the subject.

Co-operative Intelligence.

The Rochdale Equitable Pioneers' Society (Limited).—Mr. Ashworth, the manager, writes:—"As the meat question is the most talked of now, I enclose you a paper showing the quantity, and weight, and cost of our meat sold for the last seven weeks, ending February 6th, 1866. I may also inform you that the first stone for our new central stores was laid on Monday last, February 12th, but all was done very quietly. I am also glad to inform you that we still keep on the increase; the total cash received last week, ending February 13th, is £4,586 1s. 5d., being an increase of £1,064 1s. over the corresponding week last year.

Butcher's Meat sold during the last Seven Weeks, ending February 6th.

	No.	Weight in lbs.	Cost.		
Beasts.....	107	 65,418	..... £1,668	6	3
Sheep.....	209	 16,967	 539	1	0
Pigs.....	111	 23,211	 613	6	4
	427	105,596	£2,820	13	7

New Wortley, Leeds.—A Co-operative Meat Society is being started. At the public meeting, held a few days since, 600 shares were taken up. Operations will commence immediately.

Derby Co-operative Provident Society (Limited).—The usual annual tea-party and *soirée* of the members of the above-mentioned society, and their friends in the town and neighbourhood, who are favourable to the principle of mutual Co-operation in matters of business, has been held in the Temperance Hall. A very large number were present, and the hall was well filled. The mayor (F. Longdon, Esq.) presided. The report for the past year showed that the amount of business done by the society, or, in other words, its actual returns, was £14,870, and the profits realised £1,128 17s. 4d., which had been divided as follows:—To dividends paid on members' purchases, £882 17s. 2d.; interest on capital invested, £143 0s. 3d. The sum of £102 19s. 11d., allowed for depreciating the nominal value of the property and fixtures, had during the same time very considerably improved the property. For that, and several other reasons, the financial condition of the society was never in a more satisfactory state; and considering the discount of five per cent. given on capital, and the very simple and easy mode of investing and withdrawing that capital, the committee could confidently recommend the society as one of the best and safest modes of investment open to the working classes of this country. It also further stated, that arrangements had been made during the past year which enabled the committee to work the society with a much smaller quantity of goods on hand than had been previously held, which was another improvement in the working condition of the society, for with the surplus capital so obtained they had been enabled to pay off the mortgage on the Nuns' Street property, and had thereby saved the handsome sum of £22 per annum, a circumstance highly creditable to the society, increased in its value by the fact that the whole of the property had been transferred into the hands of the society.

The Bradford Industrial Co-operative Society (Limited).—On Shrove Tuesday, a tea party was held in the Independent Schoolroom, Lister Hills, in connection with the Branch Store, when about 160 persons partook of tea. After tea a meeting was held, the chair being taken by Mr. H. W. Lush, President of the society. Addresses were delivered by the Chairman, Mr. Wainwright (ex-President), Mr. Roberts, and others, on the advantages of Co-operation. This society commenced business in 1861, and now counts upwards of 500 members, three branch shops, and one central, the weekly sales amounting to upwards of £250. On looking over our ledger, we find one member has paid cash to the society £1 9s. 6d., and has withdrawn from the society £7 4s. 6d., and at present has in £2 3s. 3d.; another paid cash 6s. 3d., has withdrawn £16 5s. 7d., and now has £1 5s.; another paid 15s., and has withdrawn £3 18s. 10d., and at present has in the funds of the society £8 18s. 3d.; and there are many even more striking than these. With such facts as these before working men, it is not a wonder to see them rush to the Co-operative shop, which is their own, and they have the satisfaction of knowing that their goods are bought at the best market, and the profit, after all expenses are paid, is divided amongst them in proportion to the amount each has purchased. There was a choir present, who sang various pieces of popular music, which greatly enlivened the meeting; also various readings from popular authors, as a diversity. A very pleasant evening was spent; and no doubt but the object for which it was got up will be gained—viz., that of inducing the working man to become a Co-operator. The meeting closed with thanks to the ladies, choir, and chairman.

Co-operation at Silkstone, near Barnsley.—This well-known colliery district is beginning to feel the advantage of the Co-operative movement. The success which the Silkstone Pioneers' Co-operative Society has attained was celebrated by a well-attended tea-meeting, in the village schoolroom, one evening last week. During the evening several addresses were delivered on the subject of Co-operation. The balance-sheet of the society for the half-year ending December, 1865, showed that four per cent. on the business done, and nearly forty per cent. on the capital invested, had been made during the past year. The society was shown to be progressing, the sales amounting to about £20 per week. The system of giving credit to members was shown to be unnecessary, and was discontinued.

Proposed London Co-operative Meat Company (Limited).—Capital £2,000, in 4,000 shares of 10s. each. The promoters of the proposed company call the attention of all who think that the present high price of meat is due to a monopoly established by meat salesmen, to the manifest advantages of a Co-operative company, that will simply undertake to buy meat of the best quality in the best markets, and sell it to the members of the company, and to the public, at the lowest price that will cover the weekly expense of working the same. It is proposed to limit the depôts to 500 or 1,000 shareholders, and rent good shops in various parts of London for the sale of meat on a new plan—viz., every joint to have a ticket upon it with the weight and price marked in plain figures, and signed by the proper officer of the company; each joint to be numbered and recorded in a book kept for that purpose, so as to prevent mistakes or extortion. Applications for shares may be made by letter, addressed to Mr. Allen, secretary, *pro tem.*, 47, Hethpool Street, Paddington, W., who will give every information on this subject.

The Joint-Stock Coal Company (Limited) presents an excellent example of what can be accomplished by Co-operation. After declaring a dividend of 10 per cent. on the capital, an additional bonus of 4 per cent. of the total profits has been paid to the consuming shareholders, which is equal to a return of 2s. 6d. per ton upon the price paid for the coal, thus giving to the shareholders coal in reality at cost price.

General Information.

CLUBS AND INSTITUTES.

Hollinwood, near Oldham.—A crowded meeting was held, on Tuesday evening, in the largest schoolroom of this populous "village" (containing 10,000 inhabitants), for the purpose of establishing a Working men's Club and Institute. The chair was occupied by Benjamin Lees, Esq., millowner, supported by John Platt, Esq., M.P.; William Lees, Esq.; Alfred Butterworth, Esq.; Henry Buckley, Esq.; and the Revs. J. Robinson, incumbent of Hollinwood; B. T. Thompson, curate; J. Williams, Independent minister; — Eastwood, Wesleyan; and W. Rothern. The Rev. H. Solly delivered an address, explanatory of the objects of the meeting, and was followed by Mr. Platt and several other gentlemen. Various resolutions were moved by working men, and seconded by some of the above-named gentlemen, and were heartily and enthusiastically adopted. Mr. Platt, in moving that a subscription-list be opened, announced his intention of giving £50 towards the proposed building, amidst loud cheers. Messrs. Lees and Butterworth announced, on behalf of their respective firms, that they would each give £250, on hearing which the gratitude of the men was very warmly and vociferously shown. Mr. Solly observed that he had never attended any meeting where such liberal sums had been promised for the object, which, however, is well deserving of all that can be done for it. Cordial votes of thanks were given to that gentleman and Mr. Platt, and the meeting separated. It would be well for the working men in other districts if they could generally meet with such liberal help in establishing these useful societies.

WAGES AND STRIKES.

Great Meeting of London Engineers.—A crowded meeting of the operative engineers employed in the districts of Poplar, Limehouse, and Blackwall, was held on Friday evening at the Burdett Hall, Burdett Road, Limehouse, in furtherance of the movement for an advance of wages. Upwards of 1,000 men were present, both society and non-society men. A resolution was moved, "That the men in the eastern districts consider that an advance of 10 per cent. should be made upon the present rate of wages." An amendment was then moved, "That the minimum rate of wages be fixed at 36s. per week, with 10 per cent. advance on that amount." On the vote being taken, there was a large majority in favour of the original resolution for 10 per cent. on the present rate of wages, and the resolution was ordered to be sent to the aggregate meeting as the opinion of the eastern districts. From the tone of this and other meetings that have been held, there is little doubt that, in the event of the above being refused by the employers, an extensive strike will be the result.

The Preston Spinners and Minders.—The master cotton-spinners and manufacturers of Preston and its neighbourhood have received a memorial from their spinners and minders, asking for an advance of wages. At a meeting which the spinners and minders have had on the subject, it was stated the average wages of the minders of Preston was 17s. 10½d. a week, whilst the minders of Chorley were getting at the rate of 30s. per week for the same description of work.

The Lock-out of 400 Miners at Thorncliffe.—The lock-out of about 400 miners at the Thorncliffe and Chapeltown Collieries, belonging to Messrs. Newton, Chambers, and Co., still continues, with no signs of a termination. A deputation waited upon the proprietors of the mines a few days ago, and was given to understand that each man who wished to begin work, must apply to the proprietors individually, and not as a deputation, when they would consider the applications. A large meeting was afterwards held, when it was resolved that no more offers be made to the masters. The men locked out are receiving from 8s. to 10s. weekly from the Miners' Union, according to their circumstances. The men in the district who have obtained the advance number about 8,000, and seem willing to support the 400 whilst out of work. It is to be feared that the struggle will be a severe one.

About three weeks ago the puddlers employed on the Ravensdale Iron Works, Tunstall, dissatisfied with the quantity of iron supplied to them for working, struck work, but resumed it after two or three days' idleness. Since then a new manager, to whom these men object, has been appointed, and about a week since they again turned out. The proprietor (Mr. W. Bates) has closed the works, and upwards of 600 men and boys are thus "locked out" until the malcontents unconditionally return to work.

The Durham Masons have turned out on strike for a rise of wages from 28s. to 30s. per week, and shorter hours of labour, and three months hence for a half holiday on Saturdays.

There is every probability of a disastrous strike and lock-out in the file trade in Sheffield. A number of the file-grinders are now on strike, and unless an arrangement is effected within a few days, the whole will be unemployed, and the file-cutters will be locked out. The history of the dispute is brief. Some time ago, when the revival of the American demand imparted great animation to nearly all branches of Sheffield trade, the file-grinders met and demanded an advance, which the masters said would be equal to 33⅓ per cent. on the prices they were then paying. The advance was refused, and the grinders then sought the assistance of the powerful Filesmiths' Union. Several stormy meetings have been held, and at one of them nearly the whole strength of that Union (4,000) was present. The file-cutters have revived a demand which was postponed last year, and they now seek for a considerable advance. It should be stated that the file-cutters have to deal with the file after it leaves the hands of the grinders, and therefore they depend upon those men for work. The masters, upon receiving notice from the grinders, gave notice to the whole of the forgers and hardeners, in order that they might not have them upon their hands when the grinders were out. The filesmiths have deter-

mined to support the grinders, who are backed up by the Association of Organised Trades of Sheffield. The file-grinders say that their funds will support them in a strike for three months; but the case is different with the smiths, who have 20,000 persons—men and their wives and families, apprentices, &c.—involved in the struggle.

Correspondence.

**** We shall be happy to receive early information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *Le Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

LEICESTER WORKING MEN'S CLUB.

To the Editor of the "Working Man."

Sir,—I have read with care Mr. Coaton's letter in your last number, having waited with some anxiety to see an explanation of a transaction, concerning which I had already been informed by persons at Leicester. Of course, I have not the slightest right or wish to interfere in the proceedings of the members and friends of the Leicester Working Men's Club and Institute, or of any other club; equally, of course, I cannot help feeling a deep interest in those proceedings, and, in common with every friend to the movement, shall doubtless be willingly allowed the right of commenting upon them. For, quite apart from any help I may have been instrumental in giving towards the establishment of a particular club, and which might justify my urging recommendations or warnings, it must never be forgotten that, as with individuals, so with societies, no club lives, prospers, languishes, or dies, to itself alone. Other clubs, both in *esse* and in *posse*, are materially affected by the wisdom, or folly, the zeal or apathy, of each club in a given district; while the progress of the whole movement is, of course, most seriously influenced by the success or failure of the various efforts made to promote it in individual cases.

Hence, when the news came that the committee of the Leicester Working Men's Club, in a question which experience shows is one of vital importance, had reversed the decision of the general meeting, I shared the surprise and regret felt by many of its best friends, but, of course, forbore writing to your journal, till I had seen the letter which Mr. Coaton told me he had written. Having read it, I need not say no one ought to doubt that the committee have acted with the best intentions, and in the belief that they were taking the fairest and wisest course open to them. But I confess that, after fully considering what is there related, it appears to me they have made two serious mistakes. I may be wrong, but surely, in the first place, they should not have included "intending members" in their invitation; and, in the second place, having done so, I think they should not have set aside the decision arrived at, on the ground that many had voted for it who did not at once enrol themselves as members. Would not the proper course have been to abide by that decision for a week or two, until they saw how many would join the club on that basis, or until they could summon another duly qualified meeting of *bonâ fide* members, and then have submitted the question to them? It is a serious thing for a committee to reverse the judgment given by a meeting which they themselves had called, and especially one called in terms so vague that it would be impossible to say of many persons whether they were justified or not in attending it. A man may *intend* to join a club, and a dozen circumstances may afterwards lead him to alter his mind.

However, if the men who voted in the large majority against the beer did not come forward in sufficient numbers to establish the club on that basis (and *eighteen* was certainly a very poor show), they could not wonder at the committee, after due time, taking steps to secure the support of the opposite section, and forming the club according to *their* views. But then one naturally asks, what time was given for the previous majority to enrol their names? That so few were given in at the meeting was certainly not a sufficient test.

As to the future, if I were living in Leicester, and saw that there was a considerable number of working men who would join a club which admitted beer, under due restrictions, and who would not join it otherwise, while a number of gentlemen were willing to give their money on that understanding, as Mr. Coaton says there are, I should not decline to belong to the club, or cease to take an interest in it. On the contrary, I should do what little I could to make the club prosper, in spite of that resolution, because I do not regard the admission of beer as anything morally wrong—only as a grievous mistake. One secret of England's progress is the habit of her people to bow to majorities in matters of expediency (and, I hope we may add, to resist them in general in matters of principle). Accordingly, though out-voted, I would still work for the club, and trust to my fellow-members either learning their mistake in time, and retracing their steps, or proving to me that I was mistaken. But if I saw there was a good chance of establishing another club in the town, on what I believe to be a far sounder basis, I should certainly give what money and time I could afford to promoting that in preference. It might be a very desirable course for the friends who disapprove of the decision of the committee in question to form another club, not in a spirit of opposition, but rather of friendly rivalry and mutual co-operation. There must be plenty of room for two or more clubs in Leicester, and, if well managed, they might materially promote each other's welfare. They could each work out their own theory of a club, and see which could do the most good. There need be no ill-feeling in the matter. If Mr. Allen and his friends have erred in the course they took, those who think so must feel well assured it was simply an error of judgment, and that they were placed in a very difficult position, when, to use Mr. Coaton's words, the enterprise "came to a dead lock," and between the two stools seemed likely to have a dismal fall. I only venture earnestly to hope that, wherever it can be avoided, whether in Leicester or elsewhere, committees will not legislate on questions that should be determined by general meetings, and that, in spite of differences of opinion on matters of expediency, those who desire the welfare of one another will heartily work together for the common good.

—I am, Sir, yours obediently, Henry Solly.

THE DEAR MEAT QUESTION.

To the Editor of the Working Man.

Dear Sir,—I find in your journal of the 10th, an appeal to myself and my friends, Dr. John Watts and Mr. Max Kyllman, to attempt the solution of this question, by originating a Co-operative Company strong enough to grapple with the whole difficulty. Will you permit me, in reply, to point out one or two matters which require consideration in reference to this proposal?

First, speaking for myself, my hands are pretty full just now, as you will readily believe, and I think I may say that the same applies to Dr. Watts and Mr. Kyllman. Divided energies do not bring success, and those who originate Co-operative undertakings have a great responsibility resting upon them to make each enterprise commercially successful. Failure would not only impair our influence for the future, but, as we well know, would be debited by the unthinking against the great principle of Co-operation itself. This was the case with the struggles of the early Co-operative Societies, and delayed the progress of the movement incalculably.

Second. It is doubtful if such a company would have the confidence of the working men upon whom we should have to rely for help. In Manchester, and many other places, the Co-operative Stores have lost money by this department of business, and given it up with a profound conviction that the trade has something peculiar in it which prevents it being made profitable by them. The late secretary of the Manchester society told me, some time ago, that he candidly thought Co-operators were too honest for the business.

Third. It is doubtful if the scheme would command the support of a sufficient number of moneyed men to provide the necessary capital. It could only be made to pay by placing it on a large enough scale to afford good and efficient management. Other trades are beginning just now to be very prosperous, and joint-stock companies (especially manufacturing ones) can be formed to pay readily 15 and 20 per cent. Investors can get 8, 9, and even 10 per cent. by advances, without fastening their capital at all. Is there any chance for your suggested company under such circumstances? You will see that I look at the question from the most matter-of-fact and business-like point of view. I have learnt to know that is the true way to help Co-operation. If you will, however, open your columns to working men, and to such of their wealthy friends as feel inclined to take part in the discussion, I will gladly read all that can be said in favour of the proposal, and try to form a reliable estimate of its chances of success as regards first formation and subsequent working.—I am, dear Sir, yours very truly,

Edwd. Owen Greening.

Manchester, February 16th, 1866.

INDUSTRIAL EXHIBITIONS.

To the Editor of the Working Man.

Sir,—It is with much pleasure that I purpose subscribing to and reading your new periodical, the Working Man. With yourself, I have long deemed such a publication necessary as an organ of the working classes, the elevation of which class cannot but result in the increased strength and glory of our loved country. I sincerely trust that the Working Man may reach the hearts and minds of hundreds of thousands among our sons of toil, and that thereby their social and intellectual position may be seen to improve, while those unhappy differences between employer and employed, which ever tend to injure *all* parties, should become less frequent.

The Working Man, if I understand rightly, is to notice and record all events concerning Industrial Exhibitions which may be deemed worthy of insertion, and it is upon the subject of those exhibitions that I desire to address you.

Nobody doubts the good results which are likely, if not sure, to accrue from such exhibitions; but, as a late exhibitor, and medal winner, I wish to call your attention to one point which, if attended to, would tend very much to improve the number and quality of articles exhibited thereat. I refer to the short notice usually given of the intention to hold the exhibition. The movement commenced in London, and so rapidly did it spread that many towns in the provinces got up similar exhibitions within a very few months of the first being held.

Would it not be much better, when determining to hold such an exhibition, to fix a date farther in the future than is usually done? Work which merits extra praise requires extra time to get up and complete, and must be done in such time. Such extra good specimens of workmanship are rarely made by the "working classes" to keep in stock, but only when "made to order." If longer notice were given—say twelve months—many exhibitors would not only show what they have by them, but would set to work to produce other articles even more skilfully turned out, if possible, than any of their previous efforts. When I lately became an exhibitor, I felt the full force of the necessity of a longer notice being given. I exhibited what drawings I had on hand, feeling at the same time that I had frequently possessed far better specimens of my work, which I would have again equalled and reproduced had not the time been too short.

I trust you will consider this subject, and urge upon intending exhibition committees the great need of giving more time. Energy.

FLOATING CO-OPERATION.

To the Editor of the Working Man.

Sir,—Having observed in your impression of February 17th your notice of "Floating Co-operation," and your opinion of the suitability of the scheme to the use of working men, allow me to state that I am willing to join with any number of respectable artisans willing to start such an affair, for the working men of the East End, because I believe that the East End generally are not much thought of by our brethren farther West; and I also believe that there is nothing like the unity and brotherly feeling among the East End working men that there should be. I am only a working man myself, and it often grieves me to see the manner in which one working man treats another. And, sir, you say that the purchases of the better class of artisans are not despicable. Certainly not; for the class to which I belong earn from 7s. to 13s., and often more, per day, and upon no occasion less than 6s. per day, and, as a whole, are steady, respectable men.

Hoping you will give this your kind notice, and grant it a space in your valuable columns, I remain, Sir, yours sincerely, A Blackwall Shipwright.

Feb. 19th, 1866.

[Should the above letter elicit any response, we will forward the communication to the writer.]

TO CORRESPONDENTS.

J. G. (Hulme).—The series of illustrated articles on "Art Designs" will include the subjects referred to by our correspondent.

T. W. (Peabody Buildings).—We refer our correspondent to our description of the Buildings, in another page. He and his friends will see that we are quite satisfied the complaints which have appeared on the subject were to a great extent unfounded.

Typo.—The statement in the first article on "Coin from the Crucible," that "it was during the year 1810 that the first coining of pence took place," had reference to the operations in the New Mint, on Tower Hill. Of course there was a copper coinage long antecedent.

A Working Apprentice.—Not quite up to the mark for publication.

C. M. (Basingstoke).—Charles de Secondat, Baron de Montesquieu, was an eminent French jurist. He was born near Bordeaux, in 1689, and educated for the legal profession. Having been elected a member of the French Academy, he devoted himself to literary pursuits, and travelled through Germany, Holland, and England, where he resided two years. On his return to France he published a valuable work—"The Causes of the Greatness and Decline of the Romans;" and, subsequently, the famous book by which he is best known to English readers—"The Spirit of the Laws," an exposition of the principles of political science. He died in 1755.

S. Wootton.—The windows have been produced by a process called *Decalcomanie*. A book descriptive of this art may be obtained by order of any bookseller.

Nil Desperandum.—Sheepskin is the leather usually employed. After being suitably shaped, it is covered with two coats of parchment size, with the palm of the hand; then silver-leaf is applied by the aid of a fox-tail. This is covered with gold varnish, spread by the fingers, and smoothed with the palm of the hand. The gold varnish is made of 2½ lbs. of yellow resin; sandarach, 2½ lbs.; aloes, 1 lb. These ingredients are pounded in a mortar, and melted in an earthen pot over a slow fire, and 12 lbs. of linseed oil stirred in, and the mixture boiled until it becomes of a syrupy consistence.

S. Flowers.—The following is a good method of brouzing tin castings:—When clean, wash them with a solution of one part each of sulphate of copper and sulphate of iron in twenty parts of water; dry and wash again with distilled vinegar eleven parts, and verdigris four parts. When dry, polish with colcothar.

J. Andrews.—Japanese matches are made of thin China paper, which serves as an envelope to a small quantity of a black powder which, when ignited, throws off a beautiful coruscation of sparks, not unlike, on a small scale, the combustion of iron wire in oxygen gas. The composition of the powder is finely-powdered wood charcoal, 1 oz.; sulphur, 1¾ oz.; saltpetre, 3¼ oz. The thinnest kind of paper is necessary, for if writing-paper be employed no sparks are given off. The match contains six grains of the composition; it is held in the hand and lighted at one end. A red globule of saline matter is formed, which projects very small leaf-like sparks, forming an extremely pretty firework.

Romer.—What is called *China grass* is a species of white nettle, which grows abundantly in China and Japan. It is proposed as a substitute for cotton. Articles manufactured of this material possess many valuable qualities, which will doubtless lead to its extensive manufacture and general use. Fabrics of China grass are largely exported from China to the Americas.

Linwood, W.—Drying linseed oil by exposure to the air absorbs oxygen, and becomes converted into a solid resin; hence, of itself, it forms a varnish—varnishes being, in fact, various kinds of resins dissolved in suitable vehicles, such as spirits of wine, linseed oil, &c.

Anderson, T.—The Aneroid barometer is a very delicate instrument, and may be relied on as implicitly as the Syphon barometer. It has lately been much improved by M. Breguet.

West, S.—There are three varieties of phosphorus, the white, the yellow, and the black. Its colour is supposed to depend on its degree of purity, and the mode in which it is cooled after being melted.

A. Y. Z.—Paraffine is a solid substance resembling spermaceti, and made into candles. Paraffine oil is liquid.

Baker and Baker's True UNCOLOURED TEAS are imported and sold Free from all Adulteration; they can, therefore, be relied on for Uniform Good Quality, Fine Flavour, and Lasting Strength. Sold by Chemists, Confectioners, &c., in most Towns. [1

Government of South Australia EMIGRATION DEPARTMENT.

FREE PASSAGES are granted to South Australia, in vessels chartered expressly by H.M. Emigration Commissioners, to PLOUGHMEN, farm servants, miners, masons, bricklayers, wheelwrights, blacksmiths, sawyers, carpenters, gardeners, grooms, collar and harness makers, country shoemakers, &c.

ALSO TO SINGLE FEMALE DOMESTIC SERVANTS.

Further particulars and forms of application may be obtained at the office of the Emigration Agent for the Government of South Australia, 5, Copthall Court, London, E.C. [10

Government Emigration to NEW ZEALAND.

FREE PASSAGES to CANTERBURY, N.Z., are granted by the Provincial Government to female domestic servants, and Assisted Passages to farm workmen and certain descriptions of mechanics.

Particulars of conditions may be obtained, personally or by letter.

JOHN MARSHMAN, Emigration Agent for Canterbury, 16, Charing Cross, London, S.W.

Emigration.—Passages to all PARTS OF THE WORLD.—Every information free of charge. Best ships. Cheapest rates. Goods shipped and insured.—F. BASSIL, 139, Leadenhall Street, London.

Assisted Passages to Melbourne.—Apply to R. R. ALEXANDER, Secretary, Victoria Emigrants' Assistance Society, 27A, Bucklersbury, Mansion House, E.C.

CHEAPEST EMIGRATION TO AMERICA, £5.

New York, by Steam, WEEKLY, £5 5s., cabin, £15 15s.; and Portland, £6; Baltimore, £5 5s., cabin, £15 15s.; New Orleans, £6 6s., cabin, £25. Sailing Ships to New York, £3 5s.

R. MONTGOMERIE and CO., 5, Ingram Court, Fenchurch Street, E.C. [11

E. Bourdon's Patent Gauges. GIFFARD'S INJECTOR, FOR FEEDING STEAM BOILERS. DIAMOND PAINT, FOR IRON AND WOOD WORK.

Particulars and Prices post free on application to

Tremeschini's Paraffin Lamp. This perfected Lamp for burning Mineral Oils, without the possibility of explosion, and entire absence of smell, is sold wholesale by the agent, H. Mayer, 4, Liverpool Street, City.

* This Lamp is fully described in No. 1 of the "Working Man." [22

Why Give More?—Excellent TEAS, black, green, and mixed, are now ON SALE, for family use, at 1s. 8d. per lb., at NEWSOM and CO.'S, Original Tea Warehouse, 50, Borough. Established A.D. 1745.

Coals, 16s. 6d. per Ton, Cobbles; Derby Bright, 19s.; Second Main, 20s.; best, 21s. 6d.; best Silkstone, 21s. Direct from the pit to the consumer.—C. S. HUBBARD, 32, Great Marlborough Street, Regent Street, or 59, Albany Street, Regent's Park. No travellers or agents employed.

Working Men's College.—BUILDING FUND.—Subscriptions are requested in order to allow the Proposed Buildings to be begun in the Spring. The College is self-supporting; but increase of numbers has made additional Rooms necessary. Estimated cost, £3,000. Already subscribed, £780, including £26 5s. from the PRINCE of WALES, and £278 from the Principal and Teachers. See fuller statements in current numbers of *Cornhill* and *Macmillan's Magazine*. Subscriptions received at the College, 45, Great Ormond Street; the London and County Bank, Oxford Street; and by the Treasurer, E. B. Litchfield, Esq., 4, Hare Court, Temple.

Working Men's Club and INSTITUTE UNION.—President, Right Hon. Lord Brougham. The continually-increasing extent of the operations of this Society, which has been of essential benefit to many thousands of Working Men and their Homes, renders a proportionate increase of its funds urgently necessary. The Council, therefore, confidently APPEAL to the Public to grant increased support to this truly useful movement. Contributions may be sent to the Treasurer, Henry Hoare, Esq., Jun. (Messrs. Hoare and Co., Fleet Street), or to the office, 150, Strand, where full information may be obtained. HENRY SOLLY, Secretary.

Paris Exhibition, 1867.—All demands for SPACE from intending Exhibitors must be sent, marked "Paris Exhibition," to the Secretary, Science and Art Department, South Kensington Museum, London, W., on or before 28th February, when the lists will be made up.

William Chambers, Heraldic Chaser and Embosser, 4, FOLEY STREET, PORTLAND PLACE, W.

Honourable Mention, Great Exhibition, 1851; *Honourable Mention*, 1853, *New York*.

General Life and Fire ASSURANCE COMPANY, 62, KING WILLIAM STREET, LONDON, E.C. CAPITAL, ONE MILLION. Established 1837.

Entire freedom of the assured from responsibility and the *mutual* liabilities of partnership.

A Reversionary Bonus, equivalent to from 30 to 60 per cent., according to the age of the assured, declared in 1863.

The Reserve Fund in hand is upwards of six times the amount of the annual life income.

THOMAS PRICE, Secretary.

Western Insurance Company LIMITED. (NON-TARIFF FIRE OFFICE.)

Chief Offices—7, WATERLOO PLACE, LONDON; 77, KING STREET, MANCHESTER.

PAID CAPITAL, NEARLY £80,000.

A small Pamphlet, containing full particulars, may be obtained Gratis, or sent Post Free, on application to

FRANCIS RAVENSCROFT, *Manager.* [2

The Planet Permanent Building AND INVESTMENT SOCIETY. Established by Act of Parliament, July, 1848. Annual Income exceeds £200,000. Offices, 39, CITY ROAD, FINSBURY SQUARE, LONDON, E.C. The SEVENTEENTH ANNUAL MEETING was held September 12th, 1865. The Directors reported a large Augmentation of Business, and an Accumulation of Profits, which allowed a Bonus of £10 per cent., making the Dividend for the past year £15 per cent. The sum of £12,505, the Balance of Profit, had been carried forward for future division. The Assets of the Society had been increased during the year by £106,981. The Directors confidently reaffirm that—first, as a mode of investment at once secure and profitable; secondly, in the easy terms to Borrowers, and the facilities afforded for their transactions; thirdly, in the Equitable Adjustment of Repayment and Interest; fourthly, in the mode of Redemption; and, lastly, in the moderate fixed Law and other Charges, this Society stands alone. Shares £50; Entrance Fee, 2s. 6d. per Share. Deposits to any amount—upon which no entrance fee is charged—may be made. Interest, £5 per cent., repayable on fourteen days' notice. Prospectuses and all further information may be had of EDMUND W. RICHARDSON, Secretary.

Offices—39, City Road, London, E.C. [9

THE WORKSHOPS OF THE WORLD.

FILE-MAKING AT SHEFFIELD.

Files and File-making.

THE dispute in the Sheffield file trade has had the effect of directing public attention to a numerous and industrious class of workers, to whose labours we owe the production of one of the most useful tools with which we are acquainted in modern times. It is not our purpose here to go into the origin and history of the file, interesting as the subject undoubtedly is, but to describe the various processes of its manufacture. The common file, as every workman knows, is an implement the flat or curved surfaces of which are notched or serrated in such a manner, that on being rubbed on the wood, ivory, metal, or other hard substance for which the tool is intended, a surface of more or less smoothness is obtained.

Files are made of bars of steel prepared in a peculiar manner, it being necessary that the file should be formed of the hardest possible metal, or its working surface would be speedily worn away. The steel is therefore rendered harder than usual by means of a process known as *double conversion*, the metal thus prepared being said to be *doubly converted*. Small files are generally made of cast steel, which is for this

purpose preferred to forged steel, on account of its fineness and quality. The larger kind of files are forged from bars of steel, which have been beaten into the requisite shape by means of the tilt-hammer. In some places, we believe, the steam-hammer is being used for this purpose. The largest kind of files, rather formidable looking tools, are forged from the bar steel without the latter undergoing the preliminary process of tilt-hammering. The files are then shaped—the square and flat ones by means of a common anvil and hammer; those of a circular, half round, or triangular form, by means of bosses or dies, made of the corresponding shapes, and fitting into grooves made for them in the anvil.

The surface of the file thus prepared is perfectly smooth, but it has to undergo another process—that of *softening*—before it can be serrated or *toothed*. This softening, or "lightening," as it is technically called, is effected by placing a number of *blanks*, as the uncut files are termed, in a large brick oven, made perfectly air-tight, to prevent the steel from becoming oxidised. The fire is made to play round the oven until the "blanks" are perfectly red hot, when the heat is relaxed, and the oven gradually allowed to cool. On the perfection of this process depends much of the value of the file, and the labour of the worker. If the metal be too soft, the indentions may be too heavy and irregular; if it be too hard, the workman will find much of his labour fruitlessly expended. After being softened, the "blanks" are carefully ground and smoothened down to the requisite shape, after which they are passed to the file-cutters.

File-cutting is a curious and interesting process. The cutting-rooms are generally long, low apartments, with as many windows as possible, it being essential that the workmen should have plenty of light, so as to immediately detect or prevent any flaw in the cutting. The work-benches are placed along the wall, just below the windows, each file cutter sitting upon a stool, or astride a saddle-shaped seat, immediately in front of the bench. Before each workman is a small anvil, fastened to the bench in such a way that it can be instantly removed if required. The cutter ties one of the blank files upon the anvil, securing it from slipping by means of a strap which passes over the ends of the file, and is held tightly in its place by the weight of his foot. He then takes a peculiarly shaped hammer and a short chisel, rather broad in appearance, having a carefully ground edge, and formed of extremely hard steel. If the file to be cut be a common flat one, with broad indentations, the workman's task is a comparatively light one; but if it be one of the finer kind, a wonderful degree of delicate accuracy is expected of him. If we take a common file, we shall find it covered cross-wise with a series of well-formed and strongly-defined indentations running parallel to each other. These are the result of the special training of the file cutter. No unpractised hand, even if assisted with every mechanical appliance, could compete with the productions of the regular workman, whose keen and experienced eye and his steady hand are his sole guides in determining the relative distance of each groove or cut. Indeed, according to a writer upon this subject, "so minute are these cuts in some kinds of files, that in one specimen about ten inches long, flat on one side and round on the other, there are more than 20,000 cuts, each made with a separate blow of the hammer, and the cutting-tool being shifted after each blow!" Such a file may be bought for a few pence, the purchaser never dreaming of the vast amount of patient toil necessitated by its manufacture, before it could enter the market.

The process of cutting varies somewhat with the shape of the file. If it be a flat one, the task of cutting is, as before stated, comparatively simple and easy. If it be a half-round one, the cutter still uses a straight-edged chisel, but has to make three or four cuts before a complete cross-groove can be obtained. Chisels with semi-circular edges are used for cutting some varieties of round files, but even with these the straight-edged chisel is frequently used. Various attempts have been made for the purpose of substituting mechanical labour for that of the artisan, and it is stated that in America these efforts have proved successful. But this is stoutly denied by the workmen, who strenuously insist that file-cutting is a process which cannot be properly performed by any kind of machinery, however ingenious or skilfully devised. They state that machine-made files are, and always must be, inferior to hand-made files, and for the following reason. If one portion of the file be in any degree softer or harder than the other parts, the uniformity of groove, which constitutes the principal value of a good file, could not be maintained. The chisel would sink unequally into the metal, and thus render the file worthless. It is only fair to add that the advocates of machine-cut files deny these allegations, and profess to have overcome the difficulties complained of.

After being cut, the files have to be restored to their original state of hardness. There are various ways of effecting this, each manufacturer having his own particular method. The process commonly adopted consists in covering the files with a kind of temporary varnish, or composition, to prevent oxidation and scalding of the steel when heated. The files are then heated uniformly throughout in a stove, from which, when they have reached the proper temperature, they are quickly withdrawn and suddenly plunged into a bath of cold water. The effect of this, properly performed, is to give them an extraordinary degree of hardness.

The concluding operations are very simple. The files are scoured, for the purpose of removing the varnish, then carefully washed and dried, and finally tested; after which, they are wrapped in stout brown paper and passed into the warehouse, ready to be dispatched to any part of the habitable world. In this country, the chief seat of the file manufacture is at Sheffield.

In the Dark.

A CARPENTER'S STORY.

I wouldn't have been Robinson Crusoe, not for five hundred a year and no slack. It's all werry well being your own foreman and master, and so on, but then such a life to my mind's like a well-flagged deal board just made ready for flooring. You've been over it, and touched it well down with your jack plane, and finished off with your trying-plane, and there it is—or ought to be if it aint—scamped just like a bit o' satin, every knot just like a smooth brown eye, and every bit o' grain standing out as if polished; but then turn it over, and it's all as rough, and shaggy, and splintery as can be. It's all werry well being master and gauger, but then you has to be journeyman and labourer into the bargain. But that aint it so much, for I wouldn't give a clout nail, let alone tuppence, for a feller as can't turn his hand to anything in a push; it's the loneseomeness of the thing.

I expect it's not liking to be alone made me get married; and I must say that now there's an old bird at home, and five little ones in the nest, I aint werry lonesome there. How they do open their precious young beaks, and what a sight o' stuff it does take afore you can persuade 'em to shut again! But I aint grumbling about that, mind, and I hope I never shall. However, as I said afore, I don't like being alone, for it puts me in mind of a werry lonely time; but I do like having a mate come in for an hour's chat, and join me over a pipe and a pint of half-and-half in a quiet sociable manner, same as you have to-night, Dick Smith.

That's a good trying-plane o' yours—the one you had in the shop to-day—but I never did see, and don't suppose I ever shall see, such a tool as one I lost about four years ago—leastways I didn't lose it, for I sold it; but it was a loss for all that. Fine sound bit o' beech as ever you saw; while as to the iron, there was never a better bar o' stuff came out o' Sheffield. Just show it the ile-stand now and then, and knock it up to the right set, and then—whish! whish!—the shavings would seem to run off a board as fine, and thin, and soft as—as—well as shavings, you know.

I sold that plane for two shillings, and the next week I'd have given five to get it back, but was gone again, and I've never set eyes on it since. You see, nothing looks worse than for a man to be parting with his tools; and when you see a fellow doing of it, he's either one as isn't worth his salt, or else he's werry hard drove.

Now, I suppose I do make my salt, mostlings, or else I shouldn't have been two years in this shop; but about the time I told you of, I was going to part with one o' my tools, so you may suppose that I was hard drove. It don't matter where it was, but it worn't a hundred miles from Gray's Inn Lane; and, after being out six weeks, I was took on, and got my order to be off with a lot more down into Surrey, where there was a cottage army, as they calls it, a-building.

I slips off out o' the yard, ready to bust with the good news, and I was at the bottom o' the lane and across Holborn in no time; and in less than that I was down our court where we lodged, and up two pair o' stairs, and into the room before my wife had time to hide what she was doing of.

"Hooray, mother," I says, "took on!" and then I stops short; for though I would not let her think I knew she had been having a good cry, it all at once struck me that I should be setting her off again; for I'd engaged to go down into the country for a month certain, and I should have to leave her behind—so I stops short.

"Oh, father!" she says, "I am thankful; for I don't know what could have gone next."

We had, somehow, then got into the way o' callin' ourselves "Mother" and "Father;" and so she said she didn't know what could have gone next; and I'm sure I couldn't have told her, for a many of our things had gone about that time; for what with no work, and a long spell or two o' sickness, we had to make a good many visits to a certain relative, as I'm sure every honest, hard-working man hates the werry name of.

And now I aint speaking fair, for I said *we* had to make a good many visits; but it warn't *we*, for I'm blest if I wasn't such a coward myself that I daren't go, but stopped sneaking at home, and let the wife go instead, which worn't at all manly, says you; no more it worn't.

Howsomever, when she said that, I knew that something must go; and I felt so light-hearted with the idea o' that work that I made up my mind to go myself, and wrapping my old favourite plane up in a red handkercher, I slips out into Fetter Lane, where our uncle lived. Off I goes, full swing, as if it was all right, and with my mind made up to run right in, pawn the plane, and then let the missus have the money, and make shift till I could send her some more; and then what with thinking about having to tell her I was going into the country, and about how soon the foreman would let me draw something on account, if I didn't shoot right past the shop.

"Don't turn back yet," I says to myself, "or people will think there's something wrong." So I walks right on, and gets into Farringdon Market, and makes a bit of a twist, and comes back again, meaning not to miss it this time.

There it was—three golden balls hung out, and a window full of everything one could find a name for; working men's tools and watches, silk handkerchers and silver spoons, flutes, and fiddles without any strings, pistols and telescopes—the one to make a hole in you, and t'other to look at it with—glass decanters and tooth-drawers, pincers, rings, and chains, and ear-rings, and musical boxes, and composing-sticks; but there wasn't neither a smoothing, nor a rebate, nor a moulding, nor a jack, nor a trying plane in the whole window; and I cut by as hard as ever I could, and, "Tom Scott," I says, "you're a fool! You've come to the wrong shop!"

All at once I pulled up, and pretends to be looking in at the fishing-tackle shop, and stood there a-talking, as it were, to an old stuffed Jack that was a-staring at me with his yellow eyes, and his mouth wide open and full of hooky teeth, that would let anything go in, but precious little come out again; and then, somehow or another, it seemed to me as that great stuffed jack, or pike, or whatever you call it, was a sorter imitation o' that precious relation as I came out on purpose to see.

"Ah!" says I, "and we poor chaps is the gudgeon as he lives on. And a precious gudgeon you are, Tom Scott—six feet high, fourteen stone weight, and humbugging yourself, and pretending all sorts o' gammon, because you ain't got enough stuff in you to go in like a man to pawn that plane. Tom," I says, "I'm ashamed of you! Take it home again, and ask the missus to do it for you, and don't be a humbug and say you got to the wrong shop."

And so I gave it him—that's me, you know—hot and strong for about five minutes, and then I felt better.

"Don't be a donkey," I says; and then I hugs the plane up tight, and walks on; but I'm blessed if everybody didn't seem to know where I was again', and kep' staring at the red handkercher, when they wouldn't have took a bit o'

notice if I had carried the plane in my hand, open like.

"Now for it," I says; for I'd made my mind quite up, and meant business, when I meets a policeman, and he looks at me, and I looks at him; and I don't know how a chap feels that has stolen a plane, but if he feels half as bad as I did that afternoon, why, the sooner he turns honest, and earns the tool instead, the better for him.

I knew I was a fool to mind, and kep' telling myself so; but it wasn't no use, bless you, for before I'd got a dozen yards past the policeman, if I didn't turn round to look, and, as a matter of course, there was he turned round too, and staring at me. Talk about a look! why, his eyes went through me like mortice chisels in a door jamb!

I turns round again, and scuffles on, meaning to rush into the shop. "Now for it," I says again; and I believe I should have done it, if a chap hadn't have come out at the same moment, with his hand in his pocket chinking some money, and we nearly ran against one another, and started back, for he knowed me by sight, and I knowed him, through having worked a few benches off one another up at Cubitt's.

We just nods, and he was gone like a shot; for he knowed I could tell what he'd been in there for, while, of course, I put it to you, now, I couldn't go in then, could I? On I goes ever so far up the lane, and then back once more, and this time, although I knowed everybody was looking at me, I blunders right into the shop, slips off the handkercher, and bangs the plane down on the counter.

"Lend me five shillings on this for a week," I says; and two or three people in cupboards like reaches round to see who made such a noise; but as there was four or five more people in the place, nobody takes any more notice o' me, and there I stands, hot and savage, till a skinny little chap with a penholder across his mouth, like a bit, because he was vicious, comes up and turns my old plane over, and then he mumbles as well as he could for the pen—

"How much?"

"Twelve and six," I says; for I thought he meant what did I give for the plane.

He gives it a push and shakes his head, and I was just going to speak, when I feels a hand on my shoulder, and looking round, there was the policeman I met, and he says—

"Where did you get it from, my man?"

"Bought it," says I, in a regular flurry.

"Where?" says he.

"Charing Cross," I says; and, to make a long story short, I had to let him walk back to my lodging with me, and see my basket of tools, and then he only seemed half satisfied; while half an hour after I roused up and went out, quite savage, swinging the plane in my hand, and sold it at a marine store shop for two shillings.

It was hard work to comfort the wife when she knew that she was going to be left alone; for "Oh, Tom," she says, "the poverty's hard enough to bear without having to be separated." But I promised her that I'd take a lodging, and get her down with me as soon as I found the work likely to last; but next morning at breakfast I saw more than one tear drip into her teacup.

But it was a bright morning, and I'd been doing all I could to cheer her up; for I wasn't going to start till nine; so I gave young Tom a treat—washed his head for him, and rubbed on the soap till his little nob was all white.

"Now sloosh, faryer," he says; and I sloosh'd him, and never got the soap once in his eyes, nor yet up his nose, which wasn't surprising, seeing what a little chap he was then, and no nose at all to speak of.

Well, at last I had my tool-basket ready, and a hammer through the handles to swing it over my shoulder. There were three clean aprons inside and some odds and ends I should want; and then there was nothing else to do but say good-bye. But, there, I won't tell you about it, for she took on a great deal, as it was the first time I had been away from her.

"You will write, Tom?" says she.

"Why, of course," I says.

"And I've put four sheets and some envelopes in," she says, "so that you needn't write on the back of the sandpaper with your pencil, for it's so hard to make out."

And then, after five minutes' silence, I bolted out, and wouldn't look behind till I was out of the court.

Why, of course I was sorry to leave her behind; and I went along with my heart feeling as heavy as a lump of lead, and everybody I met looking dim and weary, which I should think must have been indigestion, or something of that kind; but it soon went off, and the clear sunshiny morning seemed to brighten one up, till I felt so hearty and cheery that I was ashamed of myself, for I felt as though I ought to be miserable, like I knew the wife was at home. But there we were, several of us, along with carts full of scaffold-poles and material, and before long we were out in the open country.

Out in the open country—God bless it!—with the birds twittering in the trees and hedges; the blue sky overhead, with now and then a light cloud slowly sailing across; the soft wind smelling that delicious, that we opened our mouths and drew in great long breaths, as though we should never be tired. There were flowers everywhere—lilac, laburnum, and may; orchards full of pinky apple blossom; while as to the green of the fields in the golden sunshine, ah! it was a sight to men who had been cooped up in close London courts, without knowing where the next day's bread was to come from!

Out in the open country, with fresh beauties at every turn! Why, we were like so many boys, running by the carts, larking, shouting, and making regular fools of ourselves, which must, of course, have been owing to the light, free air. I've heerd talk of prisoners, and sick men, and their delight at being out once more; but they could not have felt happier than we did, out in the open country, on that bright May day.

Every now and then, though, something dull would keep coming over me, and I wasn't sorry when it did; for what business had I to be so happy and cheerful, knowing how miserable I had left some one at home? But so it was; and the bit o' blackness wore off, and I was as lively as the best of them five minutes after, for, mind you, it isn't money as can give the real gladness of heart.

Well, we got down to the place, and the work went on merrily. The foreman was a good fellow, and made me one or two little advances; and as there seemed to me to be work for a good three or four months, I began to look out for a little place where I could bring some one down to; and a comfortable lodging I soon found, made all my little arrangements, and sent a letter up with a post-office order inside, so that some one and the two little ones could come down comfortable next day but one.

Every one, I dare say, has his own fancies; and I don't mind telling you one o' mine. I don't know any one thing so satisfactory as driving a nail home. You make a small hole with your bradawl; in goes your nail; and then, tapping gently at first, you go on by degrees, until the head gets nearer and nearer, and at last is driven right into the soft deal board.

Not much in it! says you. Perhaps not to your way of thinking; but every man to his trade, and, you may depend upon it, in every trade there's a similar feeling. I've seen blacksmiths laugh as they pegged away at their iron; the old cobblers grin as they drew the wax-end tight; the painters wag their heads as they laid on the flatting; and something o' the same kind in most trades; and it's only reasonable that it should be so, for a fellow would not be much of a workman if he didn't love his craft.

Well, I was busy driving the nails in a piece o' boarding, thinking all the time about the missus coming down, when I makes a false stroke, hit the nail o' one side, and it flew up and caught me right in the eye.

Talk about agony! No one knows what I suffered, for in a short time the inflammation spread from one eye to the other, and I was quite blind, so that I had to be led home to my lodging. Perhaps you know what a bit o' dust, or a lash, or anything o' that kind is in your eye; you know the pain and worrying it gives you; so you can think what I suffered—a great, tall, stout fellow—as I lay turning about, with the sweat dropping off me.

Doctor came, and did all he could. Next day came, and the pain seemed easier. Next day after that came, and a letter saying my wife would not be there for another day, and some one had to read it to me, for everything was black as night; and at last, worn out with pain and lonesomeness, and the horrid fear that I was to be a blind, helpless man, I turned over upon my face, and stopped there till the pillow was quite wet.

Yes, I know it was the act of a child; but I felt one then, as I thought of the bright light of God's sunshine gone from me for ever; that I should gaze no more upon the loving face of my own wife, and that the merry, bright eyes of my little ones would sparkle for me no more. That I should henceforth grope about in the dark, seeking, like that sorcerer in the Testament, for some one to lead me by the hand. That I, the great man of bone and muscle, should be in a moment stricken down helpless, to be henceforth a burden to my poor wife, and we—poor people.

It was the act of a child, I know; for, with an exceeding bitter cry, I lay there and sobbed miserably, while every tear smarted and burned like melted lead running over my eyeballs. Oh, yes, it was the act of a child, and I knew that I was now as helpless as the weakest. How I lay and thought of poor blind Samson, and pitied him! How I called to mind those with sightless eyeballs whom I had often passed by uncaringly; and how I thought and thought what could I do for my bread in the long, long night that now seemed my future.

"In the dark! in the dark!" I kept on groaning to myself as I lay; and then I thought of the past time, and of how great a blessing I had thoughtlessly enjoyed; and then the thought came to me of other blessings which never seemed blessings before, for being mostlings short o' money, I always thought myself hard used, and growled more than I need have done. And at last of all thinking and suffering, my head seemed to get hot, and I turned delirious—half mad, you know—and went on terribly, I suppose, till two days after, when I seemed to wake up in the dark, and lay still, thinking and wondering where I was, till I heard a noise as of some one moaning, and I calls out, "Who's there?" I knew who it was directly, for I just heard the one word "Tom" sobbed out, and then there was an arm under my head, and tears falling upon my poor sightless face, and such tender, hopeful words whispering to me, as made my heart swell and beat; and I felt that, come what might—come sickness, come sorrow, blind, or able to see—I had some one to lean on, and to lead me by the hand.

We were werry quiet then, and I lay on my side trying to look through the black darkness at that dear old face that I could feel close by me, as some one kneeled down by the bed-side; but, no, I could not see it with my eyes, though I could with my heart. And then she stopped sobbing, and talked of hoping for the best, and of how the eyes of the blind had been opened, and that perhaps my affliction might, by His help, yet be removed. And so we talked and talked, and she said that we would sorrow no more about it, and then how much she could get by needlework, and all on so hopefully, that I seemed to brighten up; but only for a few moments, for I knew what a dead, helpless burden I should be. And then she must have seen my face working, and, poor lass, she broke down herself, when I said she had better have been left a widder.

At last, in the quiet o' that little room, not a sound to be heard but the twittering o' the birds outside the window, I said, in better hope, some words with her, as she knelt by me, but we got no further than "Thy will be done."

* * * * *

Dick Smith, I never knowed how much love, and tenderness, and gentleness there was in this world until I groped about it in the dark. I'd been bitter, as many a disappointed working man, and railed at my betters; but now, in the midst of my trouble, I learnt that I had walked all my life in the dark, stumbling about, and not seeing the blessings that were spread around me. We never knew want during that dark month which we spent in that pleasant country place, where my wife led me about amongst the sweet spring flowers, while everybody had a kind and loving word for me. The governor allowed me half wages, and somebody did needlework, and they used to pay her double and treble, and send me all sorts o' things, so that we were well off. Then the doctor came every day, and told me I wasn't to fret about it, for he hoped I should get my sight yet.

One day I sat trembling in my chair, with the doctor operating—not trembling at the pain, but for fear he might have been deceived; somebody stood there, too, holding my hands, for she had got leave to be present. All at once there was a

bright flash of light, and then I felt my head swim and I fainted dead away, for I could not stand up against the swelling joy that burst upon me.

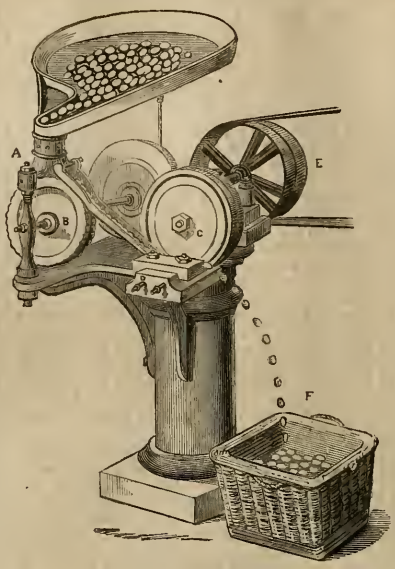
* * * * *

As keen a pair of eyes, as ready a pair of hands, and as willing and hopeful a heart as I hope are to be found in any workshop in England, Dick Smith; and I'm a humble and thankful man for it. But, Lord bless you, I has my fits of ill temper when things goes three cornered; and then Patty comes and whispers—God save her—in my ear, when the sun shines again, and I think of old times before my accident, and say to her—

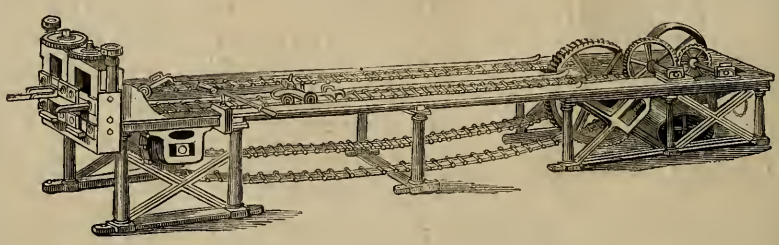
"Eyes shut, Patty. I was in the dark!"

*Coin from the Crucible to the Press.**

A more satisfactory idea of the ingenious mode of equalising the thickness of strips of the precious metals, which we described in our last paper, will be gained from the accompanying illustration of the draw-bench. It may be well, also, to explain that the strips themselves, after having been adjusted, are cut by hand-shears, mounted conveniently for the purpose on the draw-bench itself, into short lengths of about two feet each, so as to be more portable and more convenient for the cutting-out operatives to handle. It may be observed also that the draw-bench is not employed in dealing with bronze. Slight variations in the thickness of pence, halfpence, or farthings are obviously of little moment, and the rolling mills are found to do all that is necessary in the shape of adjustment, so far as fillets of that metal are concerned. Multiple cutting machines, each punching out three or more blanks at a stroke, have lately been introduced for expediting the production of blanks for conversion into the subsidiary coins just named; those machines are, however, inapplicable for gold or silver moneys.



MARKING MACHINE.



THE DRAW-BENCH.

We may now accompany a truck-load of the prepared ribands of gold into the next apartment, which is known as the cutting-press room. This is a handsome apartment of circular form, and it is surmounted by an iron roof of light and elegant construction. It contains twelve punching-presses, each independent of the other, and capable of separate and individual adjustment, so that blank pieces of various sizes may be produced simultaneously. The presses are arranged in a circle, on an iron platform at a convenient height above the stone floor of the room, space being left between the platform and the outer walls for the passage of workpeople and trucks. An upright shaft, supporting a heavy and large fly-wheel, the latter so placed as to run horizontally above the whole of the presses, occupies the centre of the circle. The fly-wheel has a series of twelve cams, or irregular projections, attached to its arms, and it travels slowly round, making, in fact, twenty-four revolutions per minute. Each press-screw has a lever fixed upon it, and this is alternately caught and released by the passing cams. Rods of iron are also attached to the levers. The rods stretch across the apartment, and pass through holes in the wall of the room into a series of small rooms or cells, in which are as many vacuum pumps as there are presses, and to the pistons of these latter the rods are connected. It will now be comprehended that, while the passing cams strike the press levers and raise the central screws of the presses, the pistons, acted upon by atmospheric pressure, pull the screws down again in quick and noisy succession.

THE COINING-PRESS ROOM.

Thus an alternate upward and downward movement of the press-screws is attained—their extent of travel being about an inch in each case. The presses themselves consist of cast-iron frames, with brass boxes or nuts in their centres for the passage through them of the main screws. To the lower end of each screw, and just above the level of the platform, the steel punches are fixed, so that they also rise and fall the distance just named, and as they descend they pass through as many steel cups, with sharp cutting inner edges, and of the exact size of the punches. Below the cups are holes leading to drawers recessed into the platform, and so arranged as to catch whatever may fall into them. It is hoped that this description of the punching machinery may lead to a more exact idea of the punching process; and now we may return to the adjusted gold fillets, which have been distributed among the cutting-boys, one of whom attends each press. The signal for commencing operations being given, the boys, seated in front of their presses, commence feeding them with gold, and by a neat arrangement of pedals and lines, each has the power of stopping and starting his press by simply exerting or relaxing the pressure of one foot on the pedal below his three-legged stool. Taking a single strip of gold, and placing its end on the cutting-out cup, one of these youthful press-feeders now starts his press, and, as his movements are copied by all his companions, it may be well to observe him closely. The punch, first raised by the fly-wheel cam, is drawn down with a sharp thud by the vacuum pump, and passes through the gold, displacing from it a blank, or disc, of the size of a sovereign, and which falls at once into the receiving drawer. Before the punch again descends, the dexterous youth pushes forward the fillet, and another disc is cut. Repeating the operation, another, and another fall into the drawer, the operator taking care to shift his strip of gold just far enough each time he moves it to bring an uncut surface beneath the punch. In a surprisingly short space of time the fillets are thus perforated from end to end, the receivers below being as speedily filled with what resemble, at this stage, shankless and rather dull-looking brass buttons. The exhausted fillets are laid aside for relegation to the melting-house, whilst supplies of new ones are handed to the cutting-boys. Thus the work of punching goes rapidly, if not musically, on, for each press produces sixty discs per minute, and careful testings of them by weight are constantly made by other attendants, in order to be assured that the punches are performing their duty accurately. It would signify but little that the metal had been adjusted exactly in thickness, if blanks were not cut of a uniform diameter. In fact, if they vary in weight more than half a grain from each other they will be useless as coin, and will not be suffered to pass out of the Mint at all. Great skill is therefore requisite in turning the punches and boring the cups, in order to prevent diversity of size in the resulting blanks.

When all the fillets have been thoroughly riddled, they are bound up for re-melting, and at this point are technically called "scissell" (from the Latin word *scindo*, to cut), as, indeed, is all kinds of

* Continued from page 140.

scrap metal in the coining department. A balance of good work and scissell is struck by the officers in charge, and the blanks are sent forward to undergo another ordeal, known as "marking." This is simply a raising of the edge or circumference of each piece, so as to prepare it for the reception, under the press, of the protecting rim, which, by-and-bye, will preserve the devices ornamenting it from defacement. This process is performed in a very beautiful, yet simple mechanical contrivance, of which we give an illustration, and which is known as the marking-machine. The blanks are seen in their various stages of progress. The workman deposits a batch of them on the surface of an inclined dish or hopper, to the lower part of which they fall by their own gravity into a tube, A, and rest upon the edge of a wheel, B, with serrations or notches upon its circumference, and which revolves under the tube. Each notch of this wheel, as it moves round, carries forward a blank, and, in exact order, they (the blanks) find their way down a smooth brass conducting-slide to the lower part of the steel disc, C, which turns rapidly on its axis, and has a groove sunk to a slight depth in its front or face. To this groove the pieces are unerringly conveyed by the conductor, and immediately *vis-à-vis* is a corresponding groove, sunk into a piece of steel, which again is fixed firmly by set screws, shown at D. This outer grooved "check" may be adjusted at any distance from the face of the revolving-disc, in accordance with the size of the blank coins to be dealt with. In this case we are treating of sovereign blanks, and the space between the two grooves is slightly less than the diameter of a finished coin of this description.

The well-known arrangement of a fast and loose pulley (seen at E) serves for starting and stopping the machine. Supposing it now to be in motion, the grooved disc will be driven in the direction from right to left as one faces the machine. The gold blanks being caught by it, are made to rotate two or three times; they are squeezed between the two grooves, and in a continuous stream, so long as the supply lasts, they are thrown forward into the basket, F, placed to contain them. On examination now we shall find that their edges have been compressed, and that thus rims have been raised on both sides of each piece, standing out beyond the plain surfaces. The marking process, too, smooths away the sharp edges which the punches have left on their circumferences, and leaves them round and sightly. At the rate of 600 per minute, blank coins, of whatever denomination, are thus "marked" at a single machine of this kind at the Royal Mint.

It will be remembered, that in the rolling-room the strips of gold were once annealed, but that afterwards they underwent a renewed series of laminations. This, and the subsequent action of the draw-bench upon the metal, hardened it again by the sheer force of compression; consequently, the blank coins cut from the strips are of the same character. To attempt to imprint devices upon them under these circumstances would be folly. They have, therefore, to be annealed, in order to make them yielding, instead of being, as they now are, obstinate and unimpressionable.

(To be continued.)

*Lessons in Mechanics.**

BY THE REV. PROFESSOR HAUGHTON, M.D., F.R.S., FELLOW OF TRINITY COLLEGE, DUBLIN.

It is a matter of great importance in the employment of human labour to make as much of its effect as is possible to be "useful" work—that is, work for which the employer ought to pay; and for this reason, if for no higher ones, it is important to lodge and feed the labourers as near the scene of their daily toil as possible, and to give them every facility that the ingenuity of mechanical contrivances can afford, to perform their work without unnecessary movements of the body to and fro.

The necessities of the landlord often require him to compel the labourers to reside at a distance from their work; but he really gains little from his narrow selfishness; for since the labourer's body, in obedience to physiological laws, can give out only a limited amount of work each day, whatever work is expended in walking to and from the place of labour is deducted from the "useful" work, of which the profits pass into the landlord's pocket.

No class of labourers suffer more, according to my experience, from this ignorance of the laws of nature in their employers, than miners of metallic ores, who are frequently obliged to climb, down and up, ladders of 200 to 300 fathoms in height, in addition to their daily work, which is diminished by the exact amount expended in mounting and descending the ladders.

Assuming, as I shall hereafter prove to be the case, that 400 ft.-tons per day is a large estimate for the available work given out by a labourer in his daily work, it is easy to calculate how much his employer loses by forcing him to descend and mount 250 fathoms of ladders each day. Multiplying 250 fathoms by 6, in order to reduce them to feet, we find 1,500 ft., which, being multiplied by 150 lb. —the weight of an average labourer —we find the

	ft.-lb.
Work done in mounting the ladders	225,000
Work done in descending the ladders, usually assumed at one-half	112,500
Total	337,500

Dividing this result by 2,240, the number of pounds in one ton, we find the quotient 150 ft.-tons for the daily work expended in carrying the miner down to, and up from, the scene of his daily toil; and from this calculation it follows that $\frac{150}{400} = \frac{15}{40}$ of his available labour is expended in useless work. If the miner were paid daily wages, he would be well worth three guineas a week, or sixty-three shillings, of which $\frac{15}{40}$, or 23s. 7½d., are expended without any return to the employer. In order to counteract this waste of labour, various mechanical contrivances have been devised to lift the miner, without labour on his part, from the depths of the mine. Among the most important of these, may be mentioned the celebrated "man engine" of Frieberg, introduced into Cornwall for the first time in Tresavean mine, and afterwards used in Dolcoath and other mines, to the great relief of the workmen and profit of the shareholders; and the inclined or diagonal shaft, employed in Botallack and United Mines, by means of which the Prince and Princess of Wales, without any effort, were lately lowered 200 fathoms below the sea, and raised again, amid the cheers of the loyal Cornishmen.

The lowest and most degrading type of human labour is that which I have already described, which consists in the effort of the labourer to raise his own weight from the ground; and it is generally assumed by mechanicians that a man so employed could raise his body through a height of one mile per day, corresponding to a daily work done of from 350 ft.-tons to 400 ft.-tons, according as the labourer's weight ranges from 150 lb. to 170 lb.

The next form of work done that I shall consider is, that in which the labourer is employed to raise materials to a height from the ground. The "hodman" employed to carry bricks from the ground to the masons at work on the scaffolding of a building is one of the best types of this old-fashioned description of work. He is represented

* Continued from page 101.

following his dangerous occupation in our first illustration.

According to the estimate of the best French writers, the work done by the hodman is—

Work per minute of raising weights, on the back, on a ladder	1,126 ft.-lb.
Work done per day of 12 hours, half rest and half work	181 ft.-tons.

The foregoing estimate takes account only of the weight lifted, for which the employer has to pay, and, of course, makes no allowance for the waste of labour involved in lifting the man himself up and down the ladder. This waste of force may be calculated as follows:—I have observed that hodmen employed in Dublin can make 40 ascents per day of ladders 40 ft. in height. If we assume the weight of the labourer and his hod to be 170 lb., then—

Work done in mounting = $170 \times 40 \times = 272{,}000$ ft.-lb.	
Work done in descending (or one-half)	136,000 ,,
Total work	408,000 ft.-lb.

Dividing this result by 2,240, the number of pounds in one ton, we find—

$$\text{Work done} = \frac{408000}{2240} = 182 \text{ ft.-tons.}$$

This work is equal to that expended in useful labour, and is entirely wasted, so far as the labourer and employer are concerned.

The total daily work of the hodman is therefore thus divided—

Useful work, lifting bricks	181 ft.-tons.
Wasted work, lifting body	182 ,,
Total	363 ft.-tons.

The hodmen of Dublin, whose labour is thus unskilfully employed, are able to earn only 12s. a week, and that in an occupation so notoriously dangerous, that it is well known to furnish a very large per-centage of the cases of accident admitted into the hospitals of the city.

The foregoing calculation tends, I think, to show that if science were summoned to direct their efforts, these poor men might easily earn 25s. per week instead of 12s., without the additional expenditure of a single ounce of force.

Dr. Young estimates the work done by a labourer employed in raising weights, by means of a rule, which leads to a result not differing materially from that of the French writers. He says*—"The daily work of a labouring man, of middle age, and in good health, will serve as a convenient unit for the comparison of moving powers of all kinds. It may be most easily remembered in this form:—A man can raise a weight of ten pounds to the height of ten feet in a second, and can continue this labour for ten hours a day." This estimate of work gives, per day—

$$\text{Work done in lifting weights} = \frac{10 \times 10 \times 60 \times 60 \times 10}{2240} = 161 \text{ ft.-tons.}$$

a result which agrees substantially with the 181 ft.-tons already deduced from French authorities.

The work thus done is supposed to be a weight lifted by means of a winch or pulley, and it is less than half the work (400 ft.-tons) per day that a healthy labourer scientifically employed ought to produce. The reason of this deficiency is different from that of the hodman. In his case half the day's labour was expended in lifting and lowering his body on the ladder, although nearly all the muscles of the upper and lower limbs were employed; but in the case of Dr. Young's labourer, working at the winch, or pulley, although the man may exert his utmost efforts, yet, as only the upper half of his body has been employed, after a whole day's labour he has only done half a day's work.

In this case, therefore, as in the last, science should be called to his aid, and the loss of 50 per cent. of precious work economised.

There is also another description of labour in which a great loss of force occurs, in consequence of the employment of a portion only of the muscles of the limbs. This labour consists in shovelling materials to a height of 5 ft., and is represented in the second illustration.

It has been ascertained, by careful observations made by Col. Morin and other French authorities, that, assuming the period of labour to be ten hours,

The work done by shovellers ("fillers") is 125 ft.-tons per day.

The error in this description of labour is two-fold:—

Firstly. The muscles of the upper limbs only are employed.

Secondly. The weight of the arms and shovel is lifted at each "cast," as well as the material itself.

Assuming (as I have found by observation) that the centre of gravity of the arms passes through the elbow-joint, and that the arms weigh 16 lbs., and that in a cast of 5 ft. 4 in. the elbow is raised 2 ft., the

Work done in raising the arms is $6 \times 2 = 32$ ft.-lbs.

It is stated on high authority that the shovels weigh 6 lbs., and that their centre of gravity is raised 4 ft. at each cast, from which it follows that the

Work done in raising the shovel is $6 \times 4 = 24$ ft.-lbs.

Six casts of the shovel usually make one cubic foot, which on the average of embankments weighs 90 lbs.; and, as the cast itself is 5 ft. 4 in., we have the

Useful work done in one "cast" $= \frac{90}{6} \times 5\frac{1}{3} = 80$ ft.-lbs.

It follows from this, that for every 80 ft.-lbs. of useful work done, 56 ft.-lbs. (32 + 24) are wasted in lifting the arms and shovel; and, since the total useful work of the day is 125 ft.-tons—

The work wasted per day $= 125 \times \frac{56}{80} = 88$ ft.-tons.

Hence, adding the previous results together, we find—

Useful work	125 ft.-tons.
Wasted work	88 ,,
Total	213 ft.-tons.

Notwithstanding the fatiguing character of this labour, the total work done, whether useful or wasted, falls far below what is obtained in other descriptions of work; and this deficiency can be explained only by the fact that in shovelling a much smaller proportion of the large muscles of the lower limbs is left unemployed than in other and more scientific kinds of work.

The estimate of the daily useful work of shovellers used above, on the authority of Col. Morin, is singularly confirmed by the observations made by Professor Lane, C.E., in the years 1848-49, on the Birmingham and Oxford Junction Railway. These observations are of great value, as they extend over a period embracing all the seasons of the year.

From these observations* it appears that each "filler" loaded $15\frac{3}{4}$ cubic yards of earth per day, that this earth weighed $1\frac{1}{2}$ tons per cubic yard, and was "cast" through a height of $5\frac{1}{2}$ feet. From these data we find—

$$\text{Work done by shovelling} = 15\tfrac{3}{4} \times 1\tfrac{1}{2} \times 5\tfrac{1}{2}$$
$$= \frac{63 \times 3 \times 16}{4 \times 2 \times 3} = 126 \text{ ft.-tons per day.}$$

This result is identical with that found previously by Col. Morin, and shows how utterly unfounded is our national prejudice that "one Englishman is equal to three Frenchmen." It has not been proved to be so, at least in the case of shovellers.

Loss of Life in Towns.†

When any of us are about to visit a strange country, our first care is, generally, to make acquaintance with some of its distinguishing characteristics, and thereby provide a basis of fact, as a nucleus for the observations naturally arising during our travel.

To such of our friends, then—and we hope their number is not few—who have read our introductory remarks on the loss of life in the great centres of the industry, intelligence, and wealth of this country, with the purpose of accompanying us in our subsequent endeavours to popularise a subject too commonly left entirely in the hands of professed statisticians, we offer a few explanatory remarks on certain technical expressions which we shall have frequent occasion to use. For unless the writer and the reader are agreed about their definitions, there can be no satisfactory result on either side.

The necessity for removing any doubt in this respect, is recognised by all who have to do with statistics; and as a case in point, we need only refer to the different systems of notation to be met with in works relating to life assurance, wherein each writer adopts his own plan, to the utter confusion of the student who would fain gather instruction from them all.

Happily our subject presents no such difficulty; its technicalities are reducible to the simplest form of words, and their illustration can be apprehended without special training for that purpose.

The term *death-rate*, or *rate of mortality*, is one which is very commonly misunderstood. It expresses the ratio between three elements—1, persons living; 2, time; and, 3, persons dying—and by losing sight of these compound units, very erroneous ideas are sometimes entertained. Thus, if the population at a given point of time is compared with the deaths in a quarter of a year, or a week, the result cannot possibly give the true rate of mortality. Again, the deaths in a district during a series of years may be doubled or trebled, or they may actually be reduced in number, and yet the *rate* of mortality may be unaffected by these fluctuations.

The *rate* of mortality is determined, then, by the ratio which the deaths bear to the years of life; and a *year of life*, which we adopt as the lifetime unit, represents one person living through a year, or two persons living through half a year; so the persons living multiplied into the *time*, will produce the years of life with which the deaths are comparable. This is, in fact, nothing more than an application of the old rule-of-three principle of reducing the divisor and dividend to the same denomination.

A disregard of this fundamental rule induced a provincial mayor, a short time ago, to challenge the accuracy of an official statement as to the mortality of a certain town. The Registrar-General had quoted the rate of mortality as so much per cent. *per annum*, during the quarter of a year then just expired, and the mayor sought to prove that this was incorrect, by showing that the deaths in that *quarter*, divided by the average population, yielded a mortality rate of only one-fourth of that which had been assigned to the town. This example illustrates the importance of a correct appreciation of the meaning of terms.

The advantage of a uniform basis for comparison needs no proof. In the computation of interest £100 is taken by general custom as the fixed unit, and a year is the most convenient unit where time is an element; so the *annual* rate of mortality is almost invariably employed for comparative purposes. Thus we see that in London the mortality for the week ending February 17th, is given as at the rate of twenty-three deaths per annum to every 1,000 persons living. That is obtained either by multiplying the deaths in that week by 52, or dividing the population by 52, so as to reduce both terms to an equality. The same rule holds good for other intervals of time. If, for example, the population of a town in the middle of 1861 was 50,000, that number represents 50,000 *years of life*; and if the deaths in that *year* were 500, the *annual* rate of mortality was one per cent.; but if the 500 deaths had occurred in six months of that year, then the *annual* rate of mortality during those six months would have been two per cent. Then another very important point to be remembered is, that the population yielding the years of life should agree as nearly as possible with that out of which the deaths occur. For example, the numbers living at the census date of 1861 are known exactly, but they would not represent the population out of which the deaths in that year occurred. Such a ratio would overstate the rate of mortality, as the population naturally increases and would, therefore, be much greater in December than it was in April. The rule generally adopted is to estimate the population to the *middle* of the year for which the mortality rate is required, on the assumption that the rate of increase observable between any two census dates may fairly be taken to rule over the years subsequent to the last enumeration. This, of course, is only an approximation, and may in some cases be quite erroneous, as, for instance, where any special movement of the population takes place in any district or town; but for all practical purposes, such an estimate is sufficiently exact; and, indeed, short of an annual enumeration, there is no safer mode of getting at the numbers living in intermediate years; for the *natural* increase, or the excess of births over deaths, is disturbed by emigration, as well as by immigration, and cannot, therefore, be relied upon.

In estimating the numbers living at any period, it must be remembered also that the population increases by geometrical progression, or by equal proportions in equal periods of time, just in the same manner as money invested at compound interest does; therefore it is not cor-

* "Lectures on Nat. Phil.," p. 101. 8vo. London, 1845.

* "Proceedings of the Institution of Civil Engineers of Ireland," 27th April, 1852.

† Continued from page 84.

rect to take one-tenth of the actual increase between two census periods, and assume that that represents the annual increase, which it would only do if the population increased by arithmetical progression, or by equal numbers in equal periods of time. The process of deducing the annual rate of increase of population by common arithmetic is very troublesome; and for the convenience of those who may desire to know a more ready way of estimating the population of any place at a given period of time, we append the following example, premising that no further acquaintance with logarithms is necessary than just enough to enable the inquirer to find the logarithm to a number, and its converse, which can be learned in a quarter of an hour:—

Example.—Required the estimated population of London in the middle of 1866?

		Log. Pop.
Population enumerated 1861 ...	2,803,989	6·4477763
Ditto 1851 ...	2,362,236	6·3733233
Logarithm of rate of increase in ten years...		0·0744530
Logarithm of *annual* rate of increase ...		0·0074453

And the number to this logarithm=1·0173; therefore as 100 increased to 101·73, the annual rate of increase in the ten years was 1·73 per cent.

The census was taken in April, 1861, and the interval between that time and the middle of 1866 is five and a quarter years, therefore five and a quarter times the logarithm of the annual rate of increase added to the logarithm of the population enumerated in 1861, will yield the required result:

Log. annual rate of increase	0·0074453
	5¼
	·0372265
	·0018613
5¼ Log. annual rate of increase	0·0390878
Log. population enumerated in 1861 ...	6·4477763
Log. population estimated to the middle of 1866	6·4868641

And the number to this logarithm is 3,068,061=the estimated population of London in the middle of 1866.

The difficulty of arriving at this result by common arithmetic will be understood when it is seen that the annual rate of increase could only be arrived at by extracting the *tenth* root of the actual increase in the ten years—an operation compared with which the finding of a cube root would be simplicity itself. Indeed, the use of logarithms for all purposes involving ratios, or the power of any number, is so advantageous in simplifying the process, as to make it well worth a person's while to obtain one of the small, cheap logarithm books, which are to be met with now-a-days, and to devote a little time to a study of their application; regarding which, all necessary instructions are given in the introduction to the Tables.

*Working Men's Clubs.**

BY THE REV. H. SOLLY.

The subject touched on at the close of my last paper, viz., as to clubs being self-supporting, is one of serious moment, but not falling within the scope of the present series. It requires a paper or two for itself. But the fact I then mentioned, viz., that many clubs are doing an immense deal of good without being self-supporting, and that some are self-supporting without doing much good, is deserving the attentive consideration of those persons who imagine that the great test of a club being wanted, of its being on a healthy basis, and likely to last, is, that it should from the beginning of its career, or very soon after, be supported entirely without help from any but its ordinary members. Unquestionably, where this can be legitimately accomplished, it is a great point gained, even as it is always an object to be earnestly striven after. But most of us had to be carried, I suppose, before we could walk; and we must not wonder if these societies, which will necessarily work a great change in the habits and tastes of those whom they are meant to benefit, should not at once receive all that support from working men which alone could make them independent of other help. I am not speaking now of the capital requisite for preliminary outlay. This, of course, must generally be found by wealthier parties than weekly wage men, although, when the latter can be induced to come forward in sufficient numbers, either to subscribe for shares in a limited liability company for building a club house and establishing a club, or to give donations for the purpose, I need not say this is the best possible basis for its formation.

Honorary members' subscriptions, however, or occasional levies on friends, to meet even current expenses, have been hitherto generally found necessary. That pioneer club established by the Rev. E. Boteler Chalmer, in Salford, Manchester (mentioned in my last paper), has needed and received such support, I understand, from its commencement in 1858; but the amount of good it has accomplished is remarkable.

In like manner the two clubs which followed Mr. Chalmer's in order of time, viz., Mrs. Bayly's, at Notting Hill, and Miss Cooper's, in Duck Lane, Westminster, have been successful to an extent as striking as it is gratifying, in benefiting their respective neighbourhoods; but the former required continual help from honorary subscriptions for the first five years of its existence, and the latter does so still—in fact, its supporters have no desire or intention of making it self-supporting. The weekly subscription there is only a halfpenny, and although many of the members would willingly pay a penny, yet, as it is greatly used by numbers of the very poorest working men—costermongers, scavengers, crossing-sweeps, &c.—Miss Cooper has always objected to increasing the subscription, in order that no one should be excluded on that ground, and because she finds no difficulty in raising the considerable sum required to make up the deficiency. No club in the country is probably doing more good than this and the one at Notting Hill, and good of a kind which leads and enables the members in various ways to improve their own pecuniary, as well as mental and moral, condition, so that it would be impossible to give money to help other people in a way that more directly assists them to help themselves. All this is equally true of the very large and flourishing club at Leeds, established by Mr. Darnton Lupton, and which costs him a comparatively large sum every year, as well as of various others through the country, which at present require honorary members' subscriptions to make both ends meet.

Moreover, in the case of clubs, many, if not most of them, only require extraneous help for a time. In the spring of last year I received returns from seventy-seven clubs, thirty-seven of which stated that they were self-supporting; but only a small proportion of these had been so from the first, while some of them would not continue to be able always to claim that distinction. Owing, in part, often chiefly, to the needful system of allowing weekly payments where they are preferred, most clubs are liable to great fluctuations of prosperity, especially during the summer months. About 100 clubs sent no returns at all, and it is to be feared a large proportion of them had no great success to announce in this direction; yet, unquestionably, like the thirty which returned themselves as non-self-supporting, they were nearly all doing much good.

Among clubs that are distinguished by having been at once self-supporting and extensively useful, I know of none that excel, few that equal, the Camden Town Working Men's Club, in King Street, Camden Town, London, N.W., commenced in 1863. Several have been as useful, and others as pecuniarily successful; but few, if any, have equally combined success in both departments. One cause has undoubtedly been excellent premises, including a concert and lecture hall, in a central situation. Another is to be found in the determination of the promoters and managers, from the first, to make the club something more than a place for mere recreation. They have fostered both the educational and commercial element, while they have, at the same time, been untiring in their attention to the recreation department. But the main secret of their success, humanly speaking, has lain in the devoted, self-sacrificing zeal and judgment of its committee and secretaries; while a still more noteworthy, because more important and rarer element of success is to be found, I believe, in the fact that, in the concluding words of their report, as a committee, they have always "sought wisdom and strength where alone it can be found." It is not, indeed, often that a club committee may be found in which, as in that of Camden Town, the persons composing it are all of them prepared and willing to commence their weekly meetings with united prayer. But I must be permitted to say I think it would be a wonderful blessing, and the surest guarantee of success, if they *could* do so and that, where that was not found practicable, if those who were thus disposed could either meet together at some other time to ask for help or guidance, or would each individually do this before coming to the meeting. It must be distinctly observed, that neither this course, nor that which the Camden Town committee have followed, in the slightest degree compromises the strictly neutral, unsectarian character of the club, which, indeed, cannot be too jealously maintained. If any of the members of a club, whether when meeting for business or any purpose, *unanimously* desire to engage in united prayer in a room where for the time being they have the sole right of access, no other person's liberty of conscience is affected, no principle of the club is in the slightest degree violated. But, of course, all depends upon the desire being unanimous.

The only ground for apprehension with regard to this club—but it is a serious one, and requiring constant attention—is, that it has been so good that tradesmen in the neighbourhood use it, and the class of working men by whom these clubs are especially needed is not so fully represented as one could wish. This drawback is probably increased by the ground-floor rooms being frequently occupied by classes and friendly societies, instead of being kept for sociable chat and the inevitable "weed." The best room in the house is given up to a "reading-room." However, there is no doubt as to the incalculable good the Camden Town Club has been instrumental in effecting.

A few other clubs should be specially mentioned as honourably distinguished, in the same way as Camden Town, for combining usefulness and financial success—viz., those at Wednesbury, Staffordshire; at South Shields and Sunderland, in Durham; at Preston and Buersill, in Lancashire; at Guildford, in Surrey; and at Essex Road, Islington, London.

The Wednesbury Club is also distinguished by owing its success almost exclusively to *bonâ fide* weekly-wage operatives, the only person a little above that rank among their managers being a clerk, whose position, character, and influence, however, have been a most valuable element in the enterprise. These men have raised more than £200 among themselves (about £7 only, I think, having been contributed by other parties), and the club has been inspired from the first with that corporate, brotherly spirit on which special stress was laid in my last paper.

The same description applies, almost word for word, to the society at South Shields. I am not equally well acquainted with the sources of the prosperity and usefulness of the Sunderland Club.

At Preston, in addition to an energetic and public-spirited committee and officers, the club has been fortunate in having its refreshment and dining rooms admirably managed; while, by turning its excellent situation (near the market) to good account, and throwing open the refreshment-room to the public, it clears £50 a year. Of course no other rooms in a club should be open to the general public without payment; and I believe that admitting casual visitors to them systematically at a penny a visit is in general a great mistake. There are exceptions, however, where the plan works well. Some clubs make a good deal of money by it, but it tends to impair, if not to destroy, the club principle. To the refreshment-rooms, however, public admission is quite a different thing. The Preston Club has lately held, in conjunction with the Literary Institution of that town, an Industrial Exhibition, whereby it will clear for its share of the profits £1,000!

The Buersill Club is to be marked with special honour, as having originated and been supported *entirely* by weekly-wage operatives (a few Sunday-school teachers, &c.), in the darkest days of the cotton famine. The feeling and principle of fellowship, self-help, and reliance upon a higher blessing, have nobly distinguished the cotton-spinners of this Lancashire settlement. It should be mentioned that the sympathy and encouragement of the vicar was of great value to them.

At Guildford and Essex Road there has been wise and vigorous management, combined with considerable attention to the educational element, while recreation has been actively cultivated.

* Continued from page 118.

MONEY PRIZES,

TO BE COMPETED FOR BY

WORKING MEN.

TWENTY PRIZES—TEN of FIVE POUNDS each, and TEN of THREE POUNDS each—are hereby offered by Messrs. Cassell, Petter, and Galpin. One Prize of Five Pounds for the Best ESSAY or PAPER, and One Prize of Three Pounds for the Second Best Essay or Paper will be appropriated to each of the following subjects, under the conditions specified below.

LIST OF SUBJECTS.

I. THE FRANCHISE.

The advantages of its extension, and the mode of extension most likely to promote generally the interests of the working classes.

II. TRADES' UNIONS.

Special regard to be had to the advantages and disadvantages of Trades' Unions. How the former may be increased, and the latter diminished. The suggestions must be of a thoroughly *practical* nature, and, where possible, illustrated by corroborative facts.

III. THE BEST MEANS OF SECURING A PERFECT ORGANISATION AND UNITY OF ACTION OF ALL THE WORKING CLASSES AS A BODY.

Special attention to be paid to the carrying into operation of such practical proposals as a Working Men's Parliament—Central Hall—Council of Advice, or Arbitration—District Councils.

IV. THE ADVANTAGES TO THE WORKING MAN OF SUNDAY AS A DAY OF REST.

Special attention to be paid to such questions as Sunday Amusements, Opening of Museums, &c., in regard to the effect which the carrying into practice of such proposals would be likely to have upon the working classes.

V. STRIKES.

Are they justifiable under any circumstances? If not, How may they be avoided?—Courts of Arbitration—Instances where disputes between employers and employed have been settled without having recourse to strikes.

VI. EDUCATION.

Of Children—of Adults—of persons in their peculiar trades—Obstacles to education at present—Proposed remedies.

VII. CO-OPERATION.

To be discussed in regard to its *practical* application for Supply of Food—Or a means of union between working men for carrying on business—Co-operation as between employer and employed—Manufacturing Co-operation—Causes of Co-operative failures.

VIII. EXHIBITIONS.

Their advantages—How to start them—What class of articles should be exhibited—Prizes—At what intervals they should be held—Should artisans be allowed to exhibit specimens of their own particular trades?

IX. WORKING CLASS DWELLINGS.

New Government Rule on this subject—Building Societies, how to form them—The Co-operative principle, how it might be more extensively adopted—The difficulties of procuring sites—The class of buildings necessary—Cost of construction.

X. DOMESTIC ECONOMY.

Practical Hints upon Household Management—Food—Domestic Education.

CONDITIONS.

I. Each essay must be the original production of a *bonâ fide* working man, or the wife or daughter of a working man.

II. The same persons may send in essays on two or more of the subjects specified.

III. Each article must be written on one side of the paper only, and on the top of the first page must be written a motto corresponding with that on an accompanying sealed envelope, which envelope is to contain the writer's real name, occupation, and address. These envelopes will not be opened until the adjudication has taken place.

IV. Each essay must, as far as possible, be of a thoroughly practical nature, and should not exceed in length three pages of the Working Man. Each page contains about 2,320 words.

V. The essays must be sent in before the first day of June next, addressed to "The Editor of the Working Man, care of Messrs. Cassell, Petter, and Galpin, Ludgate Hill, London, E.C."

VI. The papers to which the prizes shall be awarded will be published in the Working Man, and are to be the property of Messrs. Cassell, Petter, and Galpin, who will reserve to themselves the right of re-publishing them in any manner best calculated to give them the largest amount of publicity and efficiency.

VII. The Donors of the Prizes, of course, reserve the right of withholding the prizes in any department in which, according to the opinion of the Adjudicators, none of the essays submitted shall have evinced sufficient intrinsic merit.

The names of the Adjudicators will be announced in a subsequent number of the Working Man.

Opinions Wanted in Parliament.

The representation of working men is practically needed now in the House of Commons. There are no members there who know much of them personally—not one who is elected by them. The inconvenience of this is felt now in a striking way. Mr. Clay, the member for Hull, has introduced the Bill of which we have already spoken, with a view to make legal a franchise of intelligence. Mr. Gregory, the member for Galway, made a very generous speech in its support—no half-hearted utterance with a concealed purpose, frustrative, or mischievous—but an honest, thoughtful defence of the measure; even saying in a manly, open way—which no other member imitated—that if the Bill led to universal suffrage, all he had to say was, "so be it." Lord Elcho—who is a sort of king elect of the Volunteers—a connoisseur both in art and politics, gave his support to Mr. Clay's proposal. Even Mr. Horsman, who persists in being member for Stroud, and who has become a species of Ishmael among our legislators, gave the new proposition countenance. Indeed, the new franchise had the singular good fortune to receive the support of the members most able to damage it, if unfriendly to it.

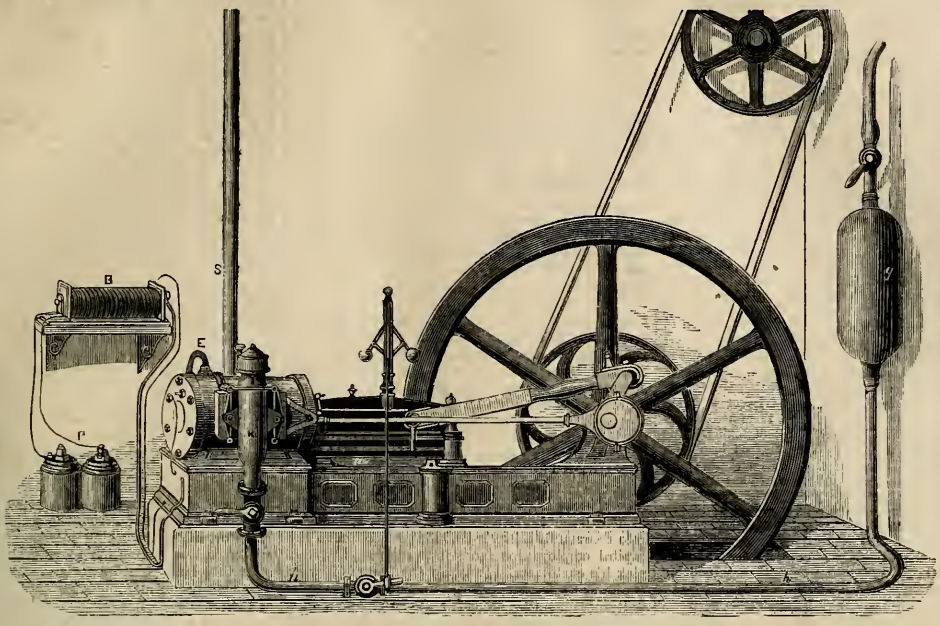
The question is fairly landed in the House, and will in due course come on for a second reading. Now a new difficulty arises. What do working men think of the Bill? Does it meet their views? Do they want it? Would they be at the trouble to go through the kind of examination proposed as a qualification for the franchise? Is Mr. Clay's Bill likely to lie upon the shelf if passed? In fine, what is the opinion of working men about it? There are members of Parliament by no means unfriendly to the working class who see objections to this Bill, but they want to know what working men themselves think of it. Since there are no representatives in the House of Commons who can personally report the opinions of working men, we, in response to some solicitations which reach us from members, undertake to make inquiries in this place.

We remember that a political union in the north of England of some reputation, did send a memorial to Lord Stanley when the Reform Bill of the Derby Government was before Parliament, praying his lordship to introduce a popular intelligence franchise into the Bill of his party; but their demand was—examination in the elements of industrial economy and constitutional history. But beyond this memorial, and a pamphlet to the same purport—published by a writer quoted by Mr. Gregory in the late debate on Mr. Clay's Bill—we do not remember any agitation among the working class on behalf of a measure founded on the Intelligence principle.

Now that a Bill is actually before Parliament to enfranchise working men who have intelligence, will intelligent working men among our readers give it attention? It is very seldom that the House of Commons wants to know the opinion of working men on any question; but now it does, its laudable and exceptionable curiosity should be gratified. Will, therefore, such working men as may peruse this article think over the subject, make up their minds upon it, and ascertain what views are entertained upon Mr. Clay's Bill, in working class circles, in workshops, in working men's clubs and institutes, in trades' unions, in reading rooms, and in whatever societies working men meet? It will fare ill with working class interests in the future—it will discourage members of Parliament anxious to promote the advancement of the people—if no attention should be given and no trouble taken to throw light upon a measure introduced with friendly intent towards them.

We have endeavoured to put with plainness the kind of questions to which answers are desired. The art of asking questions, without suggesting replies, is one of the greatest accomplishments of the lawyer. At the risk of infringing upon this excellent rule, we must indicate the points to which attention should be directed. There are many men able to give an opinion, but they naturally require to have explained to them the points on which an opinion is expected. It is calculated that a perfectly ignorant, unlettered man would require to give three months' application, to learn what would be necessary to enable him to pass his examination, and then he would have to take trouble to get unusual forms, fill them up, and dance attendance on examiners, and be at some small expense to get his certificate of the suffrage. We put the matter in the worst light, because it is in that light in which it should be considered. Do the working class want the franchise at all? If they do not, they will not take any trouble to get it. If they do desire it, will they be likely to take all this trouble to acquire it? That is the chief question.

Under this Act a candidate for a vote would require to write from dictation. A word sounding like "rane" he might write "rein," a bridle, or "rain," a shower, or "reign," the duration of Her Majesty's occupancy of the throne. He might understand each thing quite well, and be in a dense fog as to the orthography of the matter. Is he to be denied citizenship because of a clerical error which the barons who signed Magna Charta would have made? This seems absurd. But with this absurdity—which is more apparent than real—working men have just now nothing to do. Members of Parliament will exercise their wit upon these points. Voting, we are well aware, is but a small part of the duties of citizenship, which is a very different thing from clerkship. There may be objections to Mr. Clay's Bill. There are to every possible Bill. There are greater objections by far to the present blundering, irregular, uncertain, partial, and materialistic franchise which we now have, and which some people dignify with the name of "constitutional." Working men have not to consider what are the merits of this Bill compared with all possible Bills, but what would be the advantage to them of this measure, which is the only one specially directed to promote their entrance to citizenship. Answers and information on this point we shall be happy to record.



THE LENOIR AIR-ENGINE.

The Lenoir Air-Engine.

The Lenoir air-engine recommends itself to the notice of all manufacturers who require the constant or occasional use of a small motive power. In its working parts it greatly resembles an ordinary steam-engine, but it requires no steam nor coal, it has no boilers, nor feed-pumps, nor chimney, and involves no risk from fire or explosion. Its piston works with the greatest regularity, fast or slow, at the pleasure of the guiding hand; and it saws, and planes, and grinds, as if by magic.

What, then, it will be asked, is the invisible agent that gives life to these docile organs, which impart so regular a motion to this curious machine? This power which gives life to our manufacturing industry is the same agent that gives light to our cities—coal-gas: the same gas which, under the name of fire-damp, causes such terrible explosions in our coal mines. But in the Lenoir engine this destructive power is subdued to the will and convenience of the engineer, and becomes his slave.

Most of our readers have seen a flickering gas-light, in which a rapid series of trepidations, the result of an alternate mixture of a stream of air and a stream of gas occur; and they have doubtless noticed what takes place in the flame of a candle or a lamp. Similar phenomena take place in the Lenoir engine. The distributor opens in succession a series of small holes, through which a stream of gas issues, penetrates, and mixes in the cylinder with a stream of air; then an electric spark inflames the gas, which, by virtue of its great calorific power, suddenly heats and expands the air which the combustion has not decomposed. This dilated air, in proportion as the gas arrives and becomes inflamed, drives forward the piston; similar effects are produced at the other end of the cylinder; the piston returns, its motion is established, and the engine works.

The Lenoir engine is, then, a hot air-engine, or rather a *dilated air-engine*, but immeasurably superior with respect to the results obtained to any other machine of this class yet invented; for in such engines, besides the complication of the motor and its accessories, the oxygen of the air heated to a high temperature in a short time renders the cylinders useless. We have seen the cylinder of a Lenoir engine, after being in constant use upwards of two months, remain as bright as when it was turned out of the machine-shop.

The production of the gas is as simple an affair as can be desired, and requires only a very cheap material. All inflammable gases are available for this engine, but hydrogen answers best. A stream of water allowed to trickle upon live coals or coke readily yields a supply of hydrogen, which of all gases exhibits the greatest calorific power, and is consequently that which gives the maximum effect.

The engine consists of a cylinder placed horizontally upon a cast-iron frame; of a piston which works in a cylinder, and, by means of a crank, transmits its motion to the crank of the horizontal axle, to which the fly-wheel and the moving-pulley are attached. The gas arrives by the pipe *h*, after having passed through the regulating reservoir, *g*, made of vulcanised india-rubber, the function of which is to regulate the supply, and to suppress all action upon the branches which may draw from the same gas main. A pipe, K, receives the gas brought by the pipe *h*, and conveys it to the valve, which a rod, moved by the excentric chuck at the end of the axle, opens and shuts alternately. The two Bunsen batteries, P, which serve to produce the electricity, are placed near at hand, and put in communication with a Ruhmkorff's induction apparatus, represented at B. The electric current of this apparatus is conducted by isolated wires to the *distributor of electricity, m*, placed on the front of the frame of the engine, and, by an ingenious combination, the motion of the piston-rod regulates itself, by carrying a little movable runner before the distributor, and also regulates the supply of electricity, and its arrival at one or the other of the *inflamers* placed in each end of the cylinder. The burned gases, after their action in the engine, escape by means of a valve through the channel S, and the water employed to cool the motor-cylinder enters between the double envelope by a pipe placed near the gas escape-valve, and goes out by the pipe E.

Such are the elements of the Lenoir engine. To set it in motion, first establish the electric circuit; open the cock to admit the gas; turn the fly-wheel, and then the engine is in operation, and may be stopped with the same facility that we light or put out a candle.

From a half-horse power to that of three or four horses, these engines are destined to render valuable service to small manufacturers and others to whom steam power is too expensive. "I had four men," says a manufacturer, "whom I employed at grinding-mills, at a cost of 12s. a day. I have replaced them by a one-horse engine, which costs me only 6s. or 7s. a day, and works as I wish, and when I wish, always obedient and ready to serve me." All who desire a small and portable motive power, without furnace, chimney, boiler, or danger of explosion or fire, and free from all kind of nuisance to the manufacturer or his neighbours, which may be placed anywhere, in a cellar, shop, or factory, will find their wants supplied by the Lenoir air-engine.

THE MANCHESTER ART WORKMEN'S EXHIBITION.

The second annual exhibition of the Association of Art Workmen resident in and about Manchester was opened on Feb. 26. The inaugural meeting was presided over by Sir J. P. Kay Shuttleworth, Bart., and the usual address, or lecture, was delivered by Lord Houghton. The noble lord showed that, in itself, an exhibition of works of art was a good thing; that such an exhibition as that which they were inaugurating, in which art and industry were combined, was a very good thing, and that its influence upon workmen and others must be very considerable. He wished to see a larger development of the artistic feeling in manufactures, and it was but natural to ask that, in return for the beauties of scenery of which our manufacturing system had been the means of robbing us, we should have beauties of another kind. The art of which he knew most was the art of literature, and he had very frequently received verses and other specimens of that art from men who told him of the few opportunities which they had of cultivating the mind. Even when what he thus received was very poor in quality, he was careful to treat the men with respect, for they deserved it. They showed that they had some aspirations after what was better than a mere animal life. But he always took care to warn such men of the danger of looking to that which might ornament their life for their main support. To very few indeed could literature afford fortune and renown, and it was wise that those who looked to it for either should be asked to think of the disappointment which might await them. This applied as much to other arts as it did to literature. He was glad to see that in the exhibition which they were thus opening there was an illustration of the way in which working men might laudably add to their art knowledge, increase the value of their labour, and improve their own intellectual and moral condition. Such an exhibition ought to be encouraged by all classes: the upper classes ought to afford a living, not a dead patronage; employers of labour should see in it a means of increased gain to themselves, from the increase of skill in the employed; and working men themselves ought to feel more and more the advantages of cultivating to their utmost the faculties which God had given them. Such an exhibition was, too, a palpable public advantage. It ought to show how far resident workmen could do the work which, at present, it was too much the custom to have performed by men sent from a distance.

Speeches were also made by Mr. Oliver Heywood, Dr. J. Watts, Ph.D., Dr. Fairbairn, Sir J. Bardsley, the High Sheriff, Sir Elkanah Armitage, and others.

The exhibition is a very important one. The improvement upon that of last year is very apparent. Much of the space is occupied by examples of decorative

art, and in painting and graining; in wood carving and modelling, enough is shown to convince the visitor that Manchester artisans are equal to any ordinary demand which may be made upon their skill. The committee of management have done wisely in determining that the exhibition should have a distinct and useful purpose. Hence, whilst they do not utterly refuse admission to "hobbies," they show that they attach more importance to such an employment of leisure time as will tend to aid the workman in his daily duties. The association from which the exhibition springs intends devoting itself to the development of the art-skill of the workmen whom they can bring together, and one main object of their present effort is to show what skill those workmen possess now. It is hoped that, as one result of this exhibition, the association will be able to furnish, for the use of its members, a selection of educational works on industrial art, together with illustrations and practical examples, which have been hitherto beyond the reach of individual workmen, but which are of the highest value to all who aim at improvement in their various callings. Indeed, it is intended to make the association a permanent art institute for art workmen. No one can over-rate the importance of such an institution, and we believe there is so much of business tact and organising power in the Manchester working men that, with the aid and advice of those to whom they have been so far indebted, there need be no doubt of their success in their new undertaking. The exhibition contains a number of articles on loan from gentlemen who feel some interest in it, and these are mostly illustrative of art industry. Some fine old Wedgwood ware, some Sèvres porcelain of the time of Louis XV., as well as some English porcelain of to-day, will attract considerable attention. It is noticeable that the committee have attended more to the tasteful arrangement of the objects gathered together than has been the case in most industrial exhibitions. In doing this they have had the aid of two architects and an artist exhibitor.

Building Societies.

Benefit Building Societies are not at all properly understood by the great majority of the industrious classes; and even among the members of these societies themselves there is wanting an intelligent "because" for the various arrangements which are in force.

It is with a view to supply this, and to assist a "working man" to select from among the many and varied societies established *the one* that shall suit his circumstances better than all the others, either for investment, or as a help in his aspiration to become the proud owner of his own house, that these remarks are written.

Building Societies are all either permanent or terminating. A permanent society is so constituted that, while any member can terminate his connection with it whenever it may suit him, without any particular prejudice to the society or loss to himself, a constant influx of new members is secured to make up for those who, from time to time, withdraw, by the society offering precisely the same advantages to borrowers and investors who join after it has been any number of years in existence as those shareholders enjoyed who were enrolled the first year; and thus the society becomes a permanent society. We are aware that permanent societies are regarded by many as suitable exclusively to the capitalist; but as we know that many working men do, and that many more might, use them with considerable advantage to themselves and families, we cannot pass them altogether without notice.

A Permanent Benefit Building Society consists of two classes of shareholders—investors and borrowers. The former are induced to place their moneys in the society by the prospect of a high rate of interest, which the latter have to pay.

The method of receiving moneys, both on paid-up and subscription shares, is closely similar in the different societies; but in respect of repayment and rate of interest, there are scarcely two societies alike. With respect to investors, we suppose that the first consideration with a working man, who feels he can put away a few shillings periodically, is *security*. He wants to feel quite sure that what he is putting away is perfectly safe. Secondly, he must know that he will be able to get it again whenever he may require it, without loss or delay; and, thirdly, he wants, if he can get it, a higher rate of interest than can be obtained elsewhere, provided he is satisfied that his money is safe, and easily withdrawable.

Now, as to security. Those societies which speculate in houses or land—that is, buy either or both, with the expectation of selling again at a profit—must always run the risk of losses. And although we are quite aware that losses are very seldom incurred, yet, as they are now and then, we advise the working man not to use such societies for investment, but to leave them for capitalists, to whom a slight loss will not be of so much consequence.

J. Tidd Pratt, Esq., the barrister who certifies the rules of building societies, will not certify a rule empowering the directors to borrow money for the purposes of the society; so that, if money is borrowed, those who obtain the accommodation are alone liable.

A permanent society, therefore, which merely receives the subscriptions of one class of its members, the investers, to advance to the other class, the borrowers, upon approved mortgaged property, can only suffer loss in consequence of some of the property becoming forfeited, and, upon being sold, realising less than the amount advanced thereon. Seeing, however, that permanent societies make it a rule only to lend three-fourths or four-fifths of the value, and that they always set apart a certain portion of the profits to form a reserve fund, there appears to be very little probability of the investors suffering, even if a loss to the society be incurred. It is worth knowing, that the permanent societies whose charges are least to borrowers are less likely to make losses than those whose charges are higher; and this is so because, as a rule, the latter advance nearer up to the value of the property than the former; and the reason is evident: the tradesman whose prices are moderate commands a larger trade in proportion to the capital employed, is more independent, and can pick his customers. Precisely the same is it with Building Societies.

Respecting the second and third points, a working man wishing for an investment should be careful to learn from the rules for himself what are the provisions relating to withdrawal, interest, and bonus.

Some societies do not pay any interest if investing shares are withdrawn within the first year; some only four per cent. per annum for a certain period, then five per cent. for a longer period, and only the full share of profits after a long time—eight years, for instance. Other societies there are which allow the usual interest and full share of profits after the first year. The former answer the purpose of the capitalist who can allow his money to remain, because he not only takes his own share of profits, but he participates in those shares of profits which have been forfeited from time to time by the poorer members who have withdrawn, while the latter are much more suitable for the working man, because the profits are divided annually.

The average interest which permanent Building Societies pay, including bonus, appears to be about seven to eight per cent. per annum.

We come now to consider the advance department of a permanent society.

A special advantage is here offered to intending borrowers. The money can generally be obtained almost upon application; and although a man may have to pay a high rate of interest for the accommodation, it often happens that—provided he can secure a house or property by a certain time—it not only pays him to do it through a permanent Building Society, but he actually realises a handsome profit from the transaction. The following illustration will serve to show how this may be the case, the particulars being taken from a prospectus of a Building Society in London. Supposing a person wishes to purchase a £250 house; the society will advance about £200 *net*—

The re-payments to the society, including principal and interest for fourteen years	£21	10	6
Ground rent	4	0	0
Repairs, insurance, &c.	3	0	0
Total	28	10	6

The rental of such a house will be about £26 per annum. Thus, after allowing for law costs and amount paid to complete the purchase, with interest thereon, for the whole term, and the extra annual amount required beyond the rental of the house, there appears a clear profit of £120 to the member at the end of the term; or, to put it the other way, he will then be in possession of a £250 house of his own, to enjoy rent free for the remainder of the lease, at a cost of only £130. If a working man intends, however, applying for an advance, let him bear in mind that very nearly all permanent societies deduct a certain amount from their shares for commission or discount. The exact net amount which is advanced per share, should, therefore, be ascertained, as well as the gross amount of the re-payments required; also, what proportion of the purchase-money is usually advanced by the society, and the amount of the surveyor's and solicitor's charges; so that he may know how much ready money he will require to complete the purchase. Some societies, but not all, require, as additional security, their borrowers to keep up an investing share, which adds to the liability, although the amount paid on such share is placed to the member's credit. With respect to the mortgage, it should only secure the amount actually advanced—not, as in some societies, a certain number of monthly payments of a stated amount. Because the monthly payments include both principal and interest for the whole time; and if a member pays off the advance in seven years, instead of fourteen years, it is anything but fair to make him pay interest for the whole term. The rule on redemption ought to be very clear, so that a person redeeming within the period allowed by the mortgage, shall be charged interest only for the time he has had the use of the money.

The above particulars cannot be learned from a prospectus (indeed, sometimes it does appear as though the prospectus was merely used to veil the truth), but only by a perusal of the rules, while some of them can only be ascertained from the manager or secretary, or from some person who has actually borrowed from the society.

Unfortunately, working men have little time, and often less inclination to read the rules, even after they have joined a society. But the writer, who has had considerable experience of the working of these societies, has always found those members to be the most satisfied, and the best members, in every particular, who are acquainted with, at least, the rules of their own society. They know the extent of their liability, and do not grumble when the rules are faithfully administered, and, understanding the constitution of the society, they expect no more than they are likely to realise.

Terminating societies are of two distinct kinds; firstly, those consisting of two classes of shareholders—investors and borrowers, and which are announced to terminate in a fixed number of years; and, secondly, the Mutual Benefit Societies, which are established upon the reciprocal loan principle; that is, every member is supposed to sustain the double character of investor and borrower; these societies terminate only when all the shares have been advanced or withdrawn. We shall consider their features in another article.

(To be continued.)

The Textile Manufactures of England.

BY WILLIAM ROSSITER, FELLOW OF THE WORKING MEN'S COLLEGE.

II.—IN THE ROMAN, SAXON, AND EARLY NORMAN TIMES.

The ancient Briton knew but little of wearing clothes, and still less how to weave the materials for them. The dried skin of an animal served him alike for daily wear and nightly covering, until the Phœnician trader, who sought the "tin islands" for tin, copper, and dried skins, taught him, in return, how to make a rude kind of cloak out of the wool that had before covered his sheep.

The Roman found, in his new province, rude miners and ruder husbandmen, whose only dress was a coarse cloak made of wool, undressed, but often dyed. In the interior, where neither mining nor agriculture were known, the only occupation of the native was hunting, his only dress the skin of the bear or wolf, hyæna or tiger, that he had recently caught and killed. Of many, the only costume was a coat of paint.

With the Roman went order and system. Under his teaching, the Briton grew more corn and wore more clothes, worked deeper mines, and built better houses, began to live in towns, and to have a social life, adopting the manners of his teacher, and also his dress. This dress consisted of an under-garment, a tunic, and the toga; or, to use more modern names, a shirt, a coat, and a cloak. These were all of wool, as were also the leggings, which, with the leathern shoes or

sandals, completed the dress of either Roman or Briton.

Boadicea, the Queen of the Iceni, who headed the revolt of her subjects in the first century, wore the dress of the people against whom she led them, her vanity being even greater than her patriotism. She is described as wearing "a various-coloured tunic, flowing in long, loose folds, and over it a mantle, while her long hair floated over her neck and shoulders."

The Roman found Britain a wild country of woods and fens, peopled by a race of half-barbarous hunters and husbandmen; he left it a settled country, with large towns, good roads, a productive agriculture, and extensive exports, enjoying peace and prosperity in a much greater degree than any province on the Continent.

While every Continental province was again and again devastated by successive hordes of barbarians, the Britons, protected by the surrounding sea, that moderated alike the climate and the inroads of invaders, quietly grew corn enough, not only to feed themselves, but also to send in large quantities to Rome, and when left to themselves, the Roman legions being called home, they contested with the invading Saxons every inch of ground.

From their first landing in the Isle of Thanet, it took the Saxons nearly 150 years to establish six of the seven kingdoms of the Heptarchy. Of the Britons, some retired to the mountainous regions of the west, some remained to cultivate for the Saxon the land they had hitherto tilled for themselves and the Romans.

In the seventh kingdom of the Heptarchy, called Mercia (or boundary), all the conflicting tribes of the Saxons, together with the Britons and Romans who were living in the centre of the country, met in conflict for the land, and gradually merged into a kingdom, ruled by the strongest of them.

But all this time, and amid all this fighting, the Saxon British labourer still worked, the corn still grew, the wool was still woven into coarse cloth, and the Saxon, in time, dressed very much as the Briton and Roman had dressed before him. The alterations were in the fashion rather than in the material, in the cut rather than in the cloth.

Wool and leather were still almost the only materials for clothing, but linen was used for the under-garment, as it had been in the later time of the Roman rule. About the third century, the spinning and weaving of flax had been brought from Egypt to Rome, and soon became general in Britain. Fuller mentions in his "Church History" a St. Audre who, in the seventh century, made herself conspicuous by wearing only woollen garments, which "whether it made her more holy or less cleanly, let others decide."

The dress of a Saxon soldier was a linen shirt, a short woollen or leather tunic, and a short woollen cloak fastened on the right shoulder. Leather leggings, or pieces of wool bound round their legs, with leather shoes or slippers, completed the dress.

A Saxon leader wore a linen shirt, a long woollen tunic, and a long cloak of wool, lined with fur and bordered with gold. This was fastened in front, distinguishing its wearer from his serf by its length, quality, and manner of being worn. The women wore long loose robes, some of linen and others of wool, and a veil for the head.

The Normans—gay as adventurous, equally at home wherever they found themselves, whether in Normandy, England, Sicily, or Jerusalem—brought with them graceful manners and splendid costumes: fair linen, fine cloth, silk cloaks, gold embroidery, foreign furs, and jewelled gloves, adorned as well as clothed the new lord of the land; but his Saxon serf continued to wear the leathern coat and leggings, while the Saxon thane dressed in a style intermediate between the richness of the Norman and the coarseness of the swineherd.

But neither the splendid apparel of the Norman lord, nor the comfortable dress of the Saxon thane, was of English make. The wool made in England was still too coarse for any but the roughest use. The finest cloth was made in Flanders and in Spain; the silks were brought from India, China, and Italy.

The trade between England and the Continent was carried on chiefly by Flemish merchants. They brought hither jewels, wrought silks, cloth of gold and of silver, fine woollen cloth, spices, sugar, linen, and many other things; taking away, in exchange, raw wool, lead, tin, sheep and rabbit skins, leather, and cheese.

Venice was at this time the centre of trade between Europe and Asia; bringing to the former the silks, spices, and jewels of the latter, and taking from her, in exchange, woollen cloth, leather, and raw wool.

In the reign of Henry I., a number of Flemish weavers, whose home had been inundated by the sea, came over to England to seek a new one. Henry gave them welcome, and settled them first near Carlisle, and then in Gloucestershire.

This was the first great improvement in English weaving. Under the influence of this Flemish teaching, the quality and extent of the cloth made increased rapidly, and England began to sell less raw wool, and buy less woollen cloth, and also to send abroad more cloth of her own making, thereby enriching the country by the extent of the wages thus earned.

By the end of the twelfth century, wool weaving was established in the towns of Oxford, York, Nottingham, and Lincoln; and soon after the English weavers began to buy foreign raw wool, to work up with their own; thus further increasing both the quantity and quality of their work.

Edward III. married a Flemish princess, Philippe of Hainault, and partly from his own desire to increase the trade of his country, and partly through his wife's influence, induced great numbers of Flemish weavers to come over and settle in England. Fuller, speaking of the quantity of raw wool sent out of the country to be manufactured and then brought back again, says that the Duke of Burgundy instituted the Order of the Golden Fleece, because the English found the fleece, and the Flemings the gold by weaving it. He describes the English as "knowing no more of the wool than the sheep that wear it." He continues—

> Happy the yeoman's house into which one of these Dutchmen did enter, bringing industry and wealth along with them! Such who came in strangers within their doors, soon after went out bridegrooms, and returned sons-in-law, having married the daughter of their landlord who first entertained them. Yea, those yeomen in whose houses they harboured soon proceeded gentlemen, gaining great estates to themselves, arms and worship to their estates.

Edward dispersed his new subjects over the kingdom, lest upon anything displeasing them they should return in a body. They found in England fuller's-earth of a better quality than they had had before; and this enabled them to improve still more the process of fulling or felting, by which the fibres of the woven fabric are brought into closer contact, in which process fuller's-earth is used.

Fuller, in his quaint way, says—

> And now was the English wool improved to the highest profit, passing through so many hands, every one having a fleece of the fleece, sorters, combers, carders, spinsters, weavers, fullers, dyers, pressers, and packers. . . . Nature may seem to have pointed out our land for the staple of drapery, if the idleness of her inhabitants be not the only hindrance thereof.

Woollen manufacture was now fairly established in Norwich, Sudbury, and many towns in Essex, Kent, Sussex, Berkshire, Hampshire, Gloucestershire, Devonshire, and Yorkshire; and it is at this date of 1331, when the Flemish weavers came to England at Edward III.'s invitation, that the English woollen manufactures are generally said to have begun.

The first manufacture of silk in England was about 1400, and of cotton about 1650, so that while the wool manufacture was steadily improving under every encouragement, all the silk used was purchased from abroad, and cotton was entirely unknown. Both silk and cotton have, however, been spun and woven in other countries, from the very earliest times of which we have any records.

China is the birthplace of silk, and the only country in which it was manufactured before the Christian era. The knowledge of the art gradually extended to India, Persia, and Syria. About the year 500, some eggs of the silkworm were hidden in a hollow cane, and secretly conveyed from China to Constantinople; and from these few eggs all the countless myriads of European silkworms have been produced.

At the time of our Saviour's birth, silk was very little known in Europe, and was worth its weight in gold. Rome was the chief country where it was used, and the wearing of it was forbidden by the Emperor Tiberius to all but women of rank. The trade between Europe and India and China, the two countries where silk was wrought, was carried on by Persian merchants; but when, under the Emperor Justinian, the art was brought to Constantinople, Venice became the centre of the silk trade. About the time of the Norman Conquest, Rome was the only country in Europe in which silk was made; but in 1100, the Normans, who plundered Athens and Thebes, carried with them to their new home in Sicily both silkworms and silkspinners.

From Sicily the working of silk spread throughout Italy—Florence, Bologna, and Modena being the chief places. It next reached France and Spain; and by the end of the fifteenth century it had made its way to England, and had become one of the settled manufactures of the country, though as yet only spun and woven into narrow ribbons, and other small articles.

Cotton was spun and woven in India, its native country, in the time of Herodotus, 445 B.C., who describes a plant "producing wool instead of fruit." In the first century it was found in Egypt; the Mahometans introduced it into Arabia; and from India it was taken to China. The cotton plant, and the spinning and weaving of its woolly fibres, was thus extended over the whole of Southern Asia and Egypt. Muslin derives its name from the town Mosul, in Mesopotamia, where it was first made; nankeen from Nankin, in China; and calico from Calicut, in Hindostan.

Columbus, when he discovered America, found the cotton plant growing wild in the West India Islands, and the people wearing cotton dresses; so that cotton seems to have been native in two different parts of the world far distant from each other, and having similar names—the East and the West Indies.

Results of the New Associative Principle.

An incidental proof that Co-operation, in a partial form, has no injurious effect upon profits, comes from manufacturing quarters in Halifax. Twelve months ago, the public were informed that the firm of John Crossley and Son, of which Francis Crossley, M.P., is a principal, had converted their large carpet works into a Co-operative concern, and rendered all their numerous work-people, even the young unmarried hands of both sexes, eligible to become shareholders. The shares were fixed at £15 each. A considerable portion of the hands—a larger number than could reasonably be expected—took shares. This admission of the workmen as shareholders in the factory in which they labour may be considered to have been attended with beneficial results; and certainly no disastrous results have ensued, for the new company, after the first year of working upon the Co-operative principle, have declared 15 per cent. profit. The Messrs. Crossley may, therefore, be considered as having furnished a new means of profitable investment for the workmen in their employ. Security so undoubted and interest so high are probably not within the reach of the working class in any town. It is something to the credit of the new principle of associative industry that this result has been so early attained.

The experiment at the Methley and Whitwood Collieries, where the Co-operative principle is yet further extended, is also proceeding satisfactorily. A half-yearly report has been issued to the shareholders, and a satisfactory dividend is anticipated at the conclusion of the year. More coals have been worked than under the old system, and a better appreciation of the system is growing up among the workmen. In these collieries the workmen not shareholders participate in the profits accruing after 10 per cent. has been realised.

An energetic and experienced manufacturer in the north of England has under consideration modes of applying Co-operation to the department of engine manufacture, and to shipbuilding also, with respect to which it has not as yet been attempted to be applied.

The project of the Clayton Bar Iron Company, whose seat of operation was to be in the neighbourhood of Manchester, and which was based on well-defined Co-operative principles, has been for the present abandoned. It is said that the Co-

operative principle was fatal to it. Influential persons, who might have joined the company, were under the crude impression that Co-operation was a sentimental principle, instead of the newest productive element of industry. A new scheme is in agitation in Manchester for extending the principle of Co-operation to the production of coal and clay; but the Clayton failure remains a fact.

This circumstance, which some time ago would have been cited as a fatal fact, is now counted as a mere incidental difficulty of a nature often to be expected, provided for, and passed by, and the predetermined work of association to be proceeded with. Messrs. Greening and Co., the chief promoters—indeed, we might say, the official promoters — themselves manufacturers of iron gates, wire fences, and similar goods, have, as we briefly announced last week in our gossip column, proceeded to put their own company upon the new principle of associative interest. They have held a meeting at which it has been unanimously resolved: "That, in order to stimulate the zeal, fidelity, and goodwill of the clerks, foremen, and workpeople employed by this company, and with a view of enabling them to acquire a substantial interest in the prosperity of the firm, the directors undertake to recommend and support, at the first ordinary meeting of shareholders, the adoption of the following special arrangements:—1st. Whenever the net profits in any one half-year exceed 7½ per cent. upon the gross paid-up capital of the company, then for every additional 2½ per cent. dividend or bonus paid to the shareholders upon their capital, a dividend or bonus of 2½ per cent. shall be paid to every person employed by the company upon the amount of wages earned by him or her in the same half-year; provided always that such participation in profits shall not give to any of the workpeople (not being shareholders) any right to interfere in any way in the management of the company's business; nor shall it render them liable to any debts or responsibilities incurred by the company. 2. That shares of the company at par value be issued from time to time to the workpeople, and that they be permitted to pay the calls upon same, either out of a common fund to be subscribed by them, or out of dividends and bonuses accruing to them. 3. That these resolutions be printed and circulated amongst the workpeople, with a cordial appeal to them to co-operate in promoting the welfare of the establishment of which they form a part."

The Messrs. Greening show great practical mastery of the new principle, and always devise very clear and just rules for applying it, not only clear but manifestly equitable, which is a most necessary thing to accomplish, and very rarely reached. Dubiety here is danger. Unless equity appears to be equity, it may look like injustice, and repel like it.

There is published in Philadelphia an industrial newspaper, entitled *Fincher's Trades' Review*, which copies weekly from the English journals the whole of the Co-operative news they happen to contain. Thus the incidents of progress made in the various towns of England and of Scotland immediately produce effects on the other side of the Atlantic, and serve as arguments to encourage the workmen of America to proceed energetically with their schemes of Co-operation. It is surely encouragement to Co-operators here to know that success achieved in Great Britain generates success across the Atlantic.

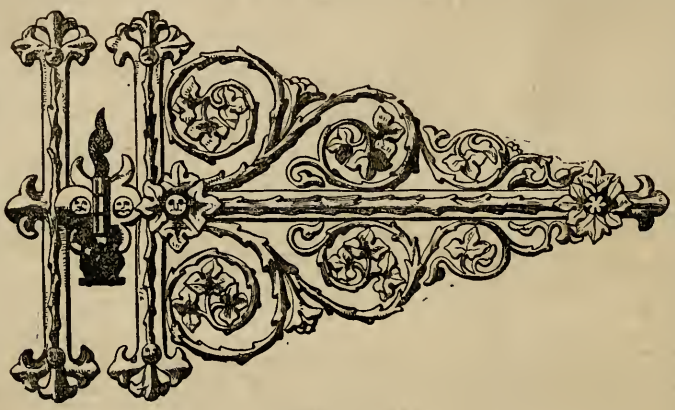
The sum required to defray the expenses for the coming year of the royal parks and pleasure-gardens under the management of Her Majesty's Commissioners of Works is £98,769. Of this sum Kew Gardens take £20,216, and St. James, Green, and Hyde Parks, £26,639.

It is estimated that the expenses connected with the Houses of Parliament in the coming year, will amount to £61,090, of which sum £21,420 is for "completing the Clock Tower, and for works in New Palace Yard and its approaches," and £4,800 for various works of art.

Art Designs

FOR USE IN TRADES AND MANUFACTURES.

In mediæval architecture, the hinge was frequently rendered a conspicuous and characteristic architectural ornament, instead of being, as at the present day, generally looked upon as a grievous eyesore, to conceal which the art of the carpenter or the mason becomes necessary, although not always with encouraging results. Architects, as a body, seem to entertain a strong aversion to the hinge as an ornamental architectural feature. Yet there are not wanting numerous modern examples to show the effective manner in which it can be rendered a graceful and appropriate adjunct to the outer doors of a building, adding not merely to their beauty, but likewise to the strength. It was in the construction of ornamental hinges and similar articles, in which ornament was combined with utility, that many of the ancient Continental iron-workers acquired much of the taste and skill which has given their productions such a widely extended fame; and it is a matter for regret that the art should have declined. The revival of Gothic art in this country has, however, led to the re-introduction, with considerable success, of the ornamental hinge into modern architecture; and, as the public taste becomes still more improved, we may naturally look for a considerable extension of the ornamental hinge manufacture. The accompanying illustration represents a tasteful specimen of this branch of art-industry.



ORNAMENTAL HINGE.

Flange Iron Girders.—The application of iron girders to domestic building purposes as a substitute for wood in beams and joists, has latterly commanded much attention in engineering and architectural circles, and it is therefore not surprising that a goodly number of scientific men responded to an invitation from Messrs. William and Thomas Phillips, of the Coal Exchange, to witness the testing of their patent solid flange girders, which took place at the experimenting works of Mr. Kirkaldy, in the Grove, Southwark. The testing machinery is fixed in an apartment having all the attributes and aspects of a millwright's workshop. Like the girders, it is the result of long and deep engineering investigation, and its province is to determine the strength and capacity of iron castings. To this ordeal two rolled iron beams adapted for a spacious West-end mansion were experimented upon, and the results were generally allowed to prove the economy and adaptability of the patent, for which credit must be given to Mr. Holman, who is alike the founder and exponent of this new application of wrought iron for buildings. While engaged in making a series of tests, this gentleman discovered that rolled iron beams always exhibited a tendency to yield laterally before their full resistance was developed, and by the application of his improvements the beam can only give vertically, thereby increasing its power of resistance, to an extent of at least 40 per cent. The first girder submitted to test snapped on a strain of 15½ tons; at 10 tons the deflection was imperceptible; at 12½ it was an inch and a third, and the set the fifth of an inch. The second girder had tests applied to it up to 30 tons, when it twisted in the centre; at 18 tons the deflection was an inch, and the permanent set the tenth of an inch; at 20 the deflection was 1·84 inch, and the set one-sixth; at 22 one and a third, with a set of one-fourth; at 24, 1½ and one-third set; at 26 tons the deflection was one and three-fourths, and at 28 two and a third, and 9-10ths of an inch set. At 30 it broke down by twisting.

HISTORY OF NAIL-MAKING BY MACHINERY.

At the last meeting of the Manchester Literary and Philosophical Society, Mr. J. P. Joule, LL.D., F.R.S., Vice-President, in the chair, a paper was read by Mr. J. C. Dyer. The following is an abstract:—"About the beginning of this century the great consumption of nails in America in wood buildings, and the high rate of skilled labour, had led to many attempts to make nails by a more summary process than that of the hammer and anvil, used for making those imported from England. Those called 'cut nails' were made by cutting angular slips from iron plates by the common shears, and the heads were made by a separate process of the die and hammer, worked by hand; and to unite these two operations in one machine was the object sought. For this purpose a machine was invented and patented by Mr. J. Odiorne, and another machine by Mr. Jacob Perkins, about the year 1806. These two patents, though for the same object, differed so far in construction that they were held to be distinct inventions. A third machine was invented by Mr. Reed, which, however, was a combination of the former two, and I believe was not held valid as a patent. In 1810, Messrs. Wells and Co., of the Charles River Iron-works, near Boston, having arranged with the patentees, sent out models of the nail machine to me in London, to be patented for our joint account. The operations of the machines were as follow:—1. Feeding-plates, of the width and thickness to form the nails, as pushed endwise over a fixed cutter, against a stop under the traversing cutter, and at such angle with the line of the cutters as to give the severed nail the head and point ends, and the plates turned over between each successive cut. 2. A fixed gripping die is placed just under the fixed cutter, the face of it and the cutter being in the same line, and the counter die moves forward to bring both together, so as to hold the nails firmly, a portion of the large end standing out beyond the dies to form the heads of the nails. 3. The heading die then advances and presses the end into the 'rose,' 'clasp,' or 'clout' heads. Success or failure often depends upon slight changes in power-driven machines. These nail machines answered very well for large nails, but failed as applied to very small ones, but as a means of saving the labour applied to making tacks and very small nails, it became important to adapt the machines to them also. This object, after some time, I succeeded in accomplishing, and thereby rendered the patent nail manufactory, established under the patents for the original invention and the improvements on it, a success. The average rate of working was about 100 per minute for nails and 120 per minute for tacks. In after practice the tack machines averaged about 80,000 a day, whilst the best hand-workers made about 1,200 to 1,400 a day. Each machine was tended by a youth, much like those employed in hand-making, so that one hand with the machine turned out as many tacks per day as would require about 60 hands working with hammer and anvil. Some of the movements in these nail machines have since been adopted, and found very efficient in riveting machines and others of recent invention."

Things Talked About.

We are now told officially that the disastrous loss of the *London* was mainly caused by the sea pouring into the vessel through the hatchway opening into the engine-room and putting out the fires; but Mr. Traill, the magistrate, and the nautical assessors who conducted the inquiry, suggest that, probably, "the same violent action of the sea which carried away the skylight might have caused some other unobserved injury to the ship." The practice of stowing a vast mass of coal on deck, and going to sea with all the top gear aloft, is condemned. Altogether, the report is well worth the earnest attention of owners and captains, and, we may add, of the public generally. One valuable practical suggestion is made—"If the deep-load line were permanently marked on all vessels, there would not be occasion to deplore the annual loss of life which occurs from presumed overloading."

The cattle plague is increasing, meat is dear, and yet a working man—in Glasgow, at least—may get a good dinner cheaply. The manager of the Great Western Cooking Depôt in that town reports that—"On the first three days of January we had repeatedly to close the doors of several of our principal branches, being quite unable to accommodate the large number of visitors who preferred the refreshments we supplied to the attractions of the public-house. The receipts for these three days

alone amounted to £721 12s.; and when I state that this involved the service and cleaning of upwards of half a million of separate articles of crockery, some idea may be formed of the extent of our labours. To give a familiar illustration—if all the persons who dined in the Great Western Cooking Depôt on these three days had been seated at one dining-table, it would have extended in one continuous line from Glasgow to Edinburgh, a distance of more than forty miles." A hot dinner of good meat, potatoes, and plum-pudding is provided for—what do our readers think?—exactly fourpence-halfpenny, and for another penny, a large cup of tea or coffee can be added. A sixpenny plate of meat is not quite unknown to Londoners, and its merits are not usually conspicuous. The cheap cook-shops of the metropolis are cheap indeed, but too often nasty into the bargain. "Of course," some persons may be disposed to say, "the Glasgow Cooking Depôt is supported by benevolence, and tradesmen must live, and to do that, must make a profit on the things they supply." Quite right, that latter clause of the sentence; but the Cooking Depôt happens to be self-supporting, and to yield a fair profit besides of nearly £890, after paying 5 per cent. interest for cash advanced to start the Depôt. A good dinner, then, can be had for less than sixpence; and if in Glasgow, why not in London and other large towns?

We all remember that, during the cotton famine of 1863-4, various public works were undertaken in the manufacturing districts, for the purpose of providing employment for the hands thrown out of work. It seems strange to say that we are gratified in learning from an official source that these works have been, for the last nine months, nearly at a standstill; but as that fact implies that labour has returned to its proper channel, and that the renewed activity of the mills has afforded fitter employment to the skilled workmen, it is really a matter for congratulation. But they did good work while employed on public works. Up to the end of December last, 515,833 lineal yards, or 293 miles, of main sewers and drains had been laid, and were in working order. The total area of paving and other works of street and highway improvement completed at the close of the year, was 1,913,685 superficial yards, or about 395 acres; the total length of these streets and highways being 236,326 lineal yards, or about 162 miles. Of the water-works several are already completed. The public parks and cemeteries are rapidly approaching completion, the Alexandra Park, at Oldham, having been opened last summer. This speaks well for English pluck. The brave men of Lancashire would not sit down and starve despondingly when work was to be obtained, however strange to their former habits. When the bobbin failed, the pickaxe was grasped manfully; and in twelve of the principal towns, earned £226,884 for themselves by honest hard work. A gratifying fact is that during all that time of trouble, "no disturbance or tumult troubled the peace and order of the district." A good argument, that, for giving the working classes a more potent voice in the government of the country.

The secretary of the Society of Acts is disposed to look despondingly upon the result of the last year's competition for prizes by workmen. In 1863, prizes to the amount of £162 were offered, seventy works sent in, and £109 out of the £162 were taken by the competitors. In 1864 the offered prizes amounted to £623; the works sent in numbered ninety-six, and the amount taken was £274. In 1865 the prizes tendered amounted to £666, of which £174 was distributed, and sixty-one specimens of work were exhibited. But Mr. H. Cole, of the South Kensington Museum, answered the secretary by saying, that though the number of specimens of art work sent in had diminished, yet the quality of the work was higher. Hitherto the competition has been limited to works executed by men in their leisure time, and not in the way of trade for an employer; and we ought to take into account the increased dearness of the necessaries of life, which renders it almost imperative that the workman should devote all his time to immediately remunerative work.

The active competition with English iron-workers by continental firms, to which we have more than once alluded, is having its effect on trade questions at home. The men employed by the Palmer Iron Shipbuilding Company have lately asked for a diminution of the hours of labour by one-tenth, without any corresponding diminution of wages. A meeting for consultation, attended by the directors of the company and about 2,000 of the workmen, has taken place, and an excellent spirit prevailed throughout. Mr. Palmer, the chairman of the company, addressed the men, showing that the rate of wages paid on the Tyne side was really higher than on the Clyde, the Mersey, or the Thames. If they virtually raised the rate of wages, by reducing the hours of working, competition would become impossible, and they would be left isolated. Besides, "competition was not only a national, but had become a continental question. France and Belgium especially were competing with us, and in every way the trial was a strong one. The measure asked for would fatally embarrass their position, and he begged they would be patient and not press upon employers what they could not by any possibility concede. This raising of wages by 10 per cent. would lessen the productive power of the district in a like degree, and just in proportion as the power of production in this country was diminished the prosperity of the foreigner would be increased." The men appeared to be struck with the force of the reasoning, and ultimately agreed to return to work, and that six of their number should meet six of the employers, and calmly canvass the whole question.

A few items respecting foreign industry in other branches of manufacture are interesting. We hear that the manufacture of French gloves has increased considerably for the last few years. In the year 1837 the gloves exported were estimated at 5,516,600f. Their value increased to 25,000,000f. in 1849, and to 30,900,000f. in 1853, and is still increasing.

The watchmakers of Clerkenwell and Coventry know well what foreign competition means, and they must prepare for a keen struggle. The French town Besançon competes successfully with Geneva in making watches, and the produce of the former town is in many places preferred to that of the latter. There were 91,595 gold and 200,418 silver watches manufactured at Besançon during the year 1865.

The London operative coachmakers, who, as yet, have little to fear from foreign competition, are endeavouring to obtain a half-holiday on Saturdays. A meeting on the subject, at St. Martin's Hall, with the Earl of Shaftesbury in the chair, was well attended, and the resolutions unanimously and enthusiastically carried. It was stated that of the 270 masters who had been applied to in the matter, 249 had sent back no reply; 13 were willing to give the half-holiday; 3 conditionally so; and 5 disapproved of it.

There is reason to believe that a strike in the building trades of Manchester is imminent. The men claim higher wages; and the masters, on their side, make a statement of their grievances. We shall be glad to hear that as good a spirit of mutual forbearance exists at Manchester as on the Tyne side. A large meeting of the masters in the building trades throughout the country is, we understand, to be held in Manchester next month, with a view to adopt some common action in the way of resisting encroachments. They say that the existing trade restrictions so hamper them that they are unable to carry on their business with "either pleasure or profit."

An ugly feature of the disputes in the building trades has appeared at Birmingham. A large firm employed a man who did not belong to the trade society, and were threatened that, unless they discharged the man, all the other workmen would leave. The man who was the medium of conveying these threats, and who had induced the other men to quit their work at a quarter of a day's notice, has been sent to prison for six months.

Another unpleasant matter is reported from Cornwall. There has been a strike at the Caradon, Marke Valley, and Drake Walls Mines; and at the latter mine, one man who wished to continue at work was "rode on a rail" through the village. In this case, too, the law will be appealed to. We are sorry to hear that there is a prospect of a very disastrous dispute throughout the district, the managers being firm on their side, and the men equally determined. So serious is the aspect of affairs, that not only in Cornwall, but in some parts of Devonshire also, the military have been called out.

The London broad silk-weavers have held a meeting to receive the report of the deputation appointed to wait on the President of the Board of Trade, and represent the depressed condition of the silk-weavers, and the great reduction in the price now paid for weaving compared with the current rate some years since. They solicited the support of the Government in asking for a Parliamentary Committee. Mr. Milner Gibson replied that he could not interfere between master and men. That is the reply which may always be expected. In this case, again, it is foreign talent and foreign enterprise which are making their way into our markets. The masters say that the effect of the late commercial treaties has been to render them unable to compete, except by a reduction of wages. A Silk-weaving Co-operative Company is talked about.

A "leading" bricklayer, employed by Messrs. Simms and Marten in the erection of a new church at South Kensington, summoned his employers, on Thursday last, for £1 5s. 10d., being the amount of four days' wages. The defence was, that he was not entitled to the money, as, during the time, the weather did not permit of his working. The question to decide was, whether he, being a leading, or foreman bricklayer, was subject to dismissal at an hour's notice, as, by the trade regulations, ordinary bricklayers are. Sir Eardley Wilmott, Judge of the Brompton County Court, decided that the plaintiff could not recover; but said he should adjudge that even hourly contracts must be considered as running during the entire day, and, therefore, gave the plaintiff a verdict for 7s., one day's pay, with costs.

Small employers are often annoyed by the delay and difficulty experienced in the collection of money owing to them, and the want of which often seriously embarrasses them. It may be the means of saving time if we tell them that, for the payment of 5 per cent. on sums under £20, the General Advance and Debt Recovery Company, 21, Harp Lane, Great Tower Street, will relieve them of all trouble in the matter, and even, when the security is good, at once make an advance on it.

The letter-carriers are preparing for a great meeting, to decide upon the most effectual means of obtaining an advance of wages, and an alteration in the scale by which promotion is now regulated. The manner in which the claims of the men have been treated by the Government has aroused a very strong feeling.

General Information.

WORKING MEN'S CLUBS AND INSTITUTES.

Working Men's Club and Institute Union.—The Council of the Union beg to give notice to members of London clubs that they have fixed on the 12th of March as the last day for sending in names for the chess competition formerly announced. It is proposed that the competition should take place in the office of the Union, 150, Strand, on Tuesday, the 20th inst., at 8 p.m. The prize, as before stated, will be books to the value of £2. —The council desire also to give notice that their visiting agent, Mr. Pocklington, will now be happy to aid the secretaries and committees of clubs in preparing for united summer excursions, cricket-matches, rowing-matches, &c. The length of time necessary to make arrangements for these trips, especially in collecting weekly contributions, renders it necessary to lose no time in commencing operations. When several clubs join together for an excursion, it not only makes it less expensive, but also secures that good fellowship between them which is extremely valuable; and the services of the visiting agent may be found very useful in enabling the secretaries to arrange for such joint excursions, if he can commence, in good time, to inform the committees of their mutual views and wishes. The council would also suggest to the secretaries of district unions the desirableness of commencing similar preparations at once in their various localities.

Appeal to Club Committees and Secretaries from the Council of the Union.—The council, once more, respectfully request those secretaries and committees who have not yet filled up the "Form" which was forwarded to them at the beginning of the year, with particulars of their respective clubs, to consider whether it is not well to take that small amount of trouble for the common good. The council again repeat that not the slightest interference with the liberty or management of individual clubs is even remotely contemplated by this or any measures adopted by the union. That union exists to aid, not to control; and its power of aiding both particular clubs and the movement generally is necessarily much promoted by gaining an accurate knowledge of the working of the various societies, of the success or failure of their various plans of usefulness, and of the extent to which they are able and willing to promote each other's welfare. The council conceive that to give this information is only a debt which each club owes to society generally; for each has received assistance from disinterested friends in its own formation and career—each has benefited largely by the interest which this Union has awakened throughout the country on behalf of Working Men's Clubs and Institutes—each, therefore, may reasonably be expected to contribute gladly, especially what costs nothing but a little time, towards the benefit of the whole movement. Should this meet the eye of any secretary who may have mislaid the form sent him, we shall gladly send him another on being informed thereof; and perhaps the committees of all the clubs in which the Working Man is read, would kindly inquire if the return from themselves has yet been sent in. The council doubt not that, both in this and all other opportunities of useful co-operation, the members of Working Men's Clubs, generally, will manifest the same spirit of sympathy for other societies of a similar kind which has nobly marked their conduct in other cases, and which has proved how well English working men understand the great truth that, whether people like it or not, they and their organisations are indissolubly bound together for mutual good or evil so long as they continue to exist. The council take this opportunity of cordially thanking those gentlemen who have already forwarded their returns. Henry Solly.

The Chelsea Working Men's Club.—The annual festival of this club was recently held at the Vestry Hall, King's Road, and, though the weather was most unpropitious, the gathering of members and their friends was most numerous. Tea was on the table at six o'clock, when about 300 sat down. After the tea, the large hall was prepared for a vocal and instrumental concert, which had been arranged for the further entertainment of the club. The whole was under the able direction of Mr. James Radermacher, of whose earnest and indefatigable labours too much praise cannot be spoken. Miss Kate Montgomery presided most ably at the pianoforte, which was one of Erard's best, and there was a good selection of songs and recitations. A very pointed and appropriate address had been written for the occasion by Mr. Wyeth, one of the members, and was spoken by Mr. C. Lacey with considerable effect. The hall was well filled, and the greatest satisfaction was manifested.—[We much regret that we have not hitherto found an opportunity of inserting the above; but we do so now, though it is rather after date, both because the members of the club have manfully exerted themselves for its prosperity, and because they took the trouble—as we should be glad if all other clubs would do—to make us acquainted

with their doings. It is also an interesting and noteworthy fact in connection with this club, that the Literary Institution just opposite to it, so far from showing any unworthy jealousy of its humbler sister, has always lent its valuable help to promote the prosperity of the club.]

INDUSTRIAL EXHIBITION.

City of London Working Classes' Industrial Exhibition.—For some days previous to the opening of this important exhibition, the Guildhall was the scene of extensive preparations in connection with the inaugural ceremony, which was performed on Tuesday last, by the Lord Mayor, the programme including a grand morning concert, at which Mr. Benedict presided. It is the first exhibition of the kind held in the City proper; and the Guildhall, in its newly restored and decorated state, lends it additional interest and attraction. It contains about 1,000 articles in all, carefully selected and classified, including architectural models, specimens of carving and turning in wood and other materials, drawings in water-colours, crayons, and pencil, wood engraving, decorative furniture and cabinet work, graining and marbling, glass work, heraldry, illuminated writing, inventions for promoting domestic economy, working in leather, naval architecture, photography, and many other subjects. Between 1,400 and 1,500 offers to contribute articles have been made to the managing committee, but they were obliged to limit the number to about 1,000, and the subjects have been selected with a strict regard to their intrinsic interest. A guarantee fund to a considerable amount, and to which several of the City merchants are understood to have subscribed largely, has been provided to meet the attendant expenses, and the Corporation of London has placed their ancient hall at the disposal of the committee, entirely free of cost, imposing only on them such conditions as may be necessary to ensure its safety from accident. The interior of the hall and roof has been tastefully decorated with banners, and a grand organ was put up expressly for the concert on Tuesday. The prices of tickets for the concert were 7s. 6d. and 5s. The exhibition will last five weeks, and be open from ten till five daily (Sundays excepted), and from six till nine every evening, the price for admission being 1s. in the daytime, and 6d. in the evening.

Co-operative Intelligence.

Chester-le-Street Co-operative and Industrial Society (Limited).—Mr. Wilkinson, the secretary, writes:—"It is now rather more than three years and three months since eight of us working men in the village met together to form a Co-operative Store. We managed to raise 4s. amongst us. Of course, a treasurer and secretary were appointed, and the rest were all to be committee men. Our next meeting was about the same, 4s.; but the third was better, for we had an addition of two recruits, and made our capital up to £3 10s. We secured the licence, and commenced business in a small back room of one of the members; and by strict attention and economy (for we saved all our old newspapers, and were our own grocers after leaving our employment at nights), our receipts for the first quarter were £36. Our thirteenth quarterly meeting was held in the National School-room on Saturday evening, 17th Feb., Mr. Jonathan Wilkinson, from North Hetton, in the chair, who, after a few pithy remarks on the benefits to be derived from Co-operation, called on the secretary, James Wilkinson, to read the report, which showed the receipts to be £2,128 0s. 10½d., being an increase over the previous quarter of £532 17s. 6d., allowed 5 per cent. on all paid-up shares, reduced the fixed £17, added £30 to the reserve fund, and a dividend on members' purchases of 2s. to the £1. A very pleasant evening was spent, some of the new members expressing their feelings regarding the excellent quality and good weight of the goods from the store."

Elsecar.—Following the example of several neighbouring places, it has been decided to establish a cheap meat association at Elsecar, near Barnsley, upon the Co-operative principle. The shares are £1 each, many of which are already taken up.

Hindley Friendly Co-operative Society (Limited).—On Monday evening, the 26th of February, the Hindley Friendly Co-operative Society held a tea party in the Independent Methodist Chapel, New Springs, to celebrate the opening of a new branch store at that place. Mr. James Winterbottom, the worthy president of the society, occupied the chair, and after having made a few brief remarks, called upon the secretary to read the report, from which it appears that the society has been established since May, 1858, having commenced operations with the small capital of 13s., which had been contributed by thirteen members. In July of the same year the number of members had increased to seventy, and the capital to £200. The business had increased in like proportion—in fact, so much so, that it is found necessary to take larger and more commodious premises. Accordingly, a remove was made, and the business having again outgrown the accommodation, they determined to build new stores, a public hall, and free reading-room, which were completed in June, 1864, at a cost of upwards of £2,361. In April of last year they again decided to extend their business, and resolved to build a branch store at New Springs. This branch was now completed, at a cost of about £700, and it was for the purpose of inaugurating that building they had assembled on that evening. From the statistics which follow, it appears that during the past year an increase in sales had taken place to the extent of £608 10s. 7d. as compared with the year 1863; that in 1865 the net profits amounted to £772 18s. 2d., of which sum £226 17s. 2d. had been paid for interest, £478 1s. 6d. for dividends, and £61 14s. for depreciation of fixed stock. The report, which was listened to with marked attention, concluded by observing that, should the profits allow, it was their intention also to open a free reading-room in connection with the branch store, as a means of furthering the education of the working classes, and more especially of their members, an announcement which was received with applause. The New Springs glee party having given "Hail, smiling morn" very creditably, the chairman introduced Mr. Fam, of Manchester, who said, had he known that he should have been called upon to address them that night, he might have been induced to take a memoranda of what he had said when with them on a former occasion, so as not to give a repetition; but he was glad to say that he could not speak too much (even in one strain) in favour of Co-operation. He congratulated the New Springs people on having a store in their village, and trusted they would all co-operate together, and then sure success would attend their stores. The Revs. Harvey Phillips and John Dickenson, of Wigan, having addressed the meeting, votes of thanks to the chairman, speakers, and other officials, terminated the proceedings.

Correspondence.

**** We shall be happy to receive early information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

"BUILT TO SELL."

To the Editor of the Working Man.

Sir,—Will you kindly place the following cautions before your readers who invest in "To Let or Sell" houses?

1st. Ascertain that the house is not built on made soil, where the gravel has been dug out and sold. 2nd. That it has deep, concrete foundations. 3rd. That all the materials are new, and the bricks hard "stocks." 4th. That no iron chimney bars, supporting the arch, are absent. 5th. That the drainage is distinct and separate, properly connected with the main sewer. 6th. The strength of joists, quarterings, lintels, rafters; thickness of doors, shutters, floor-boards, skirtings, shelving—in short, the quality and quantity of timber used. It is truly frightful to see how slightly houses are timbered. 7th. Whether the grates, locks, ironmongery, blinds, and other fittings are of the very cheapest description—unfit for wear. 8th. That it has a trap-door fire-escape to roof. 9th. Avoid zinc gutters, cisterns, flats, &c. as zinc is a very temporary affair. Insist upon lead or stone cisterns, &c. 10th. If the parish has not taken the road, have money security for its cost from the seller—it may save you £10 to £30. 11th. Find out if it is an estate where any scamping is allowed, to create heavy ground-rents. 12th. Investigate the title thoroughly. Beware of needy or bankrupt vendors, and improved ground-rents. Lastly. Before purchase or deposit, insist upon a legal warranty, with full specifications attached, subject to penalties if false.

Soliciting your kind co-operation to suppress "slop" building of structures, run up "to let and not to last," of which so many hundred samples can be viewed in the "speculative" building sites N., S., E., W., I am, Sir, your obliged reader, Wm. Truman.

3, Maryon Villas, Green Lanes, N., 22nd Feb., 1866.

WORKING MEN'S HALLS.

To the Editor of the Working Man.

Sir,—Having read the various articles on Working Men's Clubs, in your valuable paper, I wish to suggest a plan by which working men's halls might be built, and working men's halls established. In our village there are about fourteen lodges, or benefit societies, which average about £140 for each society. Our society has one share paid up in the building society—that, is £66.

If each of these societies were to invest their money in building a working men's hall, on the limited liability principle, in £1 shares, each lodge or society taking, say, sixty or seventy, or more, shares, according to their ability, and let the public have the chance of taking shares in the building; it would be a great boon to the lodges—by removing them from the public-house—and to the workman in general.

It is well known that public-house lodge-meetings are a great evil in many ways. For instance, it is very common at the half-yearly meetings, when they pay the rent for the lodge-room, to ask for something back for drink. Sometimes I have known the whole of the rent sent back, on condition that they would put a like sum to it and spend it all in drink. Now this is a great evil. Then, when a new member is made, they will, perhaps, ask him for his "footing," and they will all subscribe something to it and spend it in drink. This is another evil.

Then, again, there are men, and a good many of them, who will not go to the meetings, owing to their being held at the public-house. Now this is a very great evil, as it prevents that friendly intercourse which ought to exist in all friendly societies.

I should like to hear some of your more able correspondents' opinions on this subject.—Believe me, yours truly,

Bramley, Feb. 22nd, 1866. Bramley.

TO CORRESPONDENTS.

The Birmingham Exhibition.—A contributor who sends us a long letter on this subject, is requested to furnish us with his name and address. Imputations of such a serious character cannot be made on the authority of an anonymous writer.

H. F.—To solder steel upon steel, the following ingredients, finely pulverised, are employed:—Boracic acid, 41 parts; dried sea-salt, 35 parts; yellow prussiate of potassa, 15 parts; dried carbonate of soda, 8 parts. Another preparation consists of a solution of phosphorus in nitric acid, evaporate the solution to the consistence of a thick syrup, and add one or two volumes of alcohol at 80 degrees; it is applied to the iron or steel with a brush, or the metal may be dipped into it.

H. Collison.—You had better make inquiries on the spot of some one who occupies a situation similar to that you desire.

Wm. Telesfield.—Muriatic acid gas is not recognised by chemists of the present day. That term is obsolete. The other was a typographical error.

M. E.—Soluble glass may be obtained of almost every operative chemist; hydraulic lime of the dealers in limes for building.

A. L.—Blue printing-ink is made by grinding, on a marble slab, balsam of capivi, 36 parts; Prussian blue, or ultramarine, from 5 to 13 parts, according to intensity required; rosin soap, 12 parts. The longer the grinding is continued the better the colour of the ink. Your suggestion cannot be adopted, on account of the space being occupied by woodcuts.

Watson, H.—You are working at the wrong end. No kind of cowl or chimney-pot will cure a smoky chimney. You must contract the throat above the grate as much as possible, and secure a good supply of air to the fire.

John Bennett.—The reed of the harmonium consists simply of a strip of sheet brass, a full tenth of an inch thick, some two or three inches wide, which is placed on the edges and on one face. A slot is cut in it by a small circular cutter, and the ragged edge of the cut removed by a peculiarly constructed file. The tongue is sawn out by means of a series of delicate cutters, set in a wheel. Success depends upon the workmanship and experience.

G. Ascough.—To answer all your questions would require a treatise, and occupy more space than we can devote to the subject. Consult an encyclopædia, or "Days at Factories," by J. Thorne.

S. J. Cooper.—Replies to your questions would occupy more space than can be spared to the subject in these columns. The questions have been discussed in various magazines. Consult Hone's "Every-day Book."

Cuth Bushey.—1. Tackett's "Bookbinding" will supply the information you require. 2. Bookbinders' tools may be obtained at any of the large tool-shops. 3. The work will be published in monthly parts shortly. As to the other books named, no answer can be given at present.

Martin S.—The address of the agent for the sale of the paraffine lamp, described in No. 1 of the Working Man, may be found in our advertising columns.

F. J. O. (Blackheath).—We do not share our correspondent's conviction that the jug is an authentic relic, and therefore beg to decline the photograph.

A Mason (York).—There is scarcely a large town where good plaster casts from the best modern and antique sculpture cannot be obtained. In London, Brucciani's, in Great Russell Street, Drury Lane, is a large and first-class establishment.

O. P.—Salt of tartar is an old name for sub-carbonate of potassa. Salts of lemon is a compound of oxalic acid and potassa; it is not obtained from lemons, the acid of which is called *citric*.

Dayton, W.—The best mode of treating the wooden posts is to char that portion which is buried in the ground; this effectually preserves them against decay.

Amer.—The intensity and volume of the blowpipe flame may be modified by reducing the pressure and the size of the aperture in the nozzle of the blowpipe.

S. B. T.—A typographical error occurred in the reply to your inquiry in No. 8; for *carbonic* acid read *carbolic*.

W. S.—Zinc added to copper produces brass; tin and copper yield bronze, gun metal, &c., according to the proportions of each metal.

J. O. A.—Nothing is required to be done to the glycerined clay model to fit it for casting off. If any difficulty occurs, reduce the quantity of glycerine.

J. H., who inquired for particulars of glass-gilding, is informed that a letter will be forwarded to him on receipt of stamped addressed envelope.

A. B. D.—The information you require may be found in the articles on "Apprenticeship," and "Master and Servant," which have appeared in the Working Man.

"Overtime" is evidently under a misapprehension as to the indenture containing a covenant on the part of the apprentice, "to serve his master faithfully *day and night*." What is expressed in the indenture is, that he "shall not absent himself from his master's service day or night *unlawfully*." There is no law laid down as to "overtime," in the case of an apprentice. A master is bound, by the general principles of the law, not to task his apprentice unreasonably, or beyond his strength, and in case of grievance, the apprentice has his remedy by an appeal to the magistrates, as pointed out in our second article.

Baker and Baker's True UNCOLOURED TEAS are imported and sold Free from all Adulteration; they can, therefore, be relied on for Uniform Good Quality, Fine Flavour, and Lasting Strength. Sold by Chemists, Confectioners, &c., in most Towns. [7

Government of South Australia EMIGRATION DEPARTMENT.

FREE PASSAGES are granted to South Australia, in vessels chartered expressly by H.M. Emigration Commissioners, to PLOUGHMEN, farm servants, miners, masons, bricklayers, wheelwrights, blacksmiths, sawyers, carpenters, gardeners, grooms, collar and harness makers, country shoemakers, &c.

ALSO TO SINGLE FEMALE DOMESTIC SERVANTS.

Further particulars and forms of application may be obtained at the office of the Emigration Agent for the Government of South Australia, 5, Copthall Court, London, E.C. [8

The Planet Permanent Building AND INVESTMENT SOCIETY, Established by Act of Parliament, July, 1848. Annual Income exceeds £200,000. Offices, 39, CITY ROAD, FINSBURY SQUARE, LONDON, E.C. THE SEVENTEENTH ANNUAL MEETING was held September 12th, 1865. The Directors reported a large Augmentation of Business, and an Accumulation of Profits, which allowed a Bonus of £10 per cent., making the Dividend for the past year £15 per cent. The sum of £12,505, the Balance of Profit, had been carried forward for future division. The Assets of the Society had been increased during the year by £106,981. The Directors confidently reaffirm that—first, as a mode of investment at once secure and profitable; secondly, in the easy terms to Borrowers, and the facilities afforded for their transactions; thirdly, in the Equitable Adjustment of Repayment and Interest; fourthly, in the mode of Redemption; and, lastly, in the moderate fixed Law and other Charges, this Society stands alone. Shares, £50; Entrance Fee, 2s. 6d. per Share. Deposits to any amount—upon which no entrance fee is charged—may be made. Interest, 5 per cent., repayable on fourteen days' notice. Prospectuses and all further information may be had of EDMUND W. RICHARDSON, Secretary. Offices—39, City Road, London, E.C. [28

Working Men's College.—BUILDING FUND.—Subscriptions are requested in order to allow the Proposed Buildings to be begun in the Spring. Admission, Ordinary Days, 1s.; Evening, 6d.

TRANSFERABLE SEASON TICKETS, £1 1s.

Surplus funds to be appropriated to the establishment of a Free Public Library.

William Ramsey, *Hon. Sec.* [36

Offices, Guildhall.

The Victoria Benefit Society.

Enrolled Pursuant to Act of Parliament (18 and 19 Vict., cap. 63.)

Chief Office, 49, Fleet Street, London, E.C., with Branches throughout the Country.

Vice-Patrons.

Richd. D. Alexander, Esq.
Mr. Serjeant Atkinson.
Rev. Thomas Aveling.
J. Broomhall, Esq.
Rev. Jabez Burns, D.D.
Rev. Frederick Trestrail.
Harper Twelvetrees, Esq.

Trustees.

James Arbiss, Esq.
Charles Henry Elt, Esq.
John Francis Bontems, Esq.

Auditors.

Hy. J. Phillips, Esq., F.S.S.
A. Shrimpton, Esq.
Cornelius Walford, Esq., F.S.S., F.S.A.

Arbitrators.

G. M. Murphy, Esq.
Edmund Fry, Esq.
Joseph A. Horner, Esq.
Henry Thomson, Esq.

Physician.

James Edmunds, Esq., M.D., L.R.C.P.

Standing Counsel.

Samuel Pope, Esq.

Bankers.

The London and Westminster Bank.

Actuary.

W. S. B. Woolhouse, Esq., F.R.A.S., &c.

More than 20,000 Proposals for Assurance have been received, and upwards of £10,000 paid in claims.

This Society is adapted to every class, *saves all the expenses of Public House Meetings*, which are forbidden by the Rules, secures all the advantages of a *Sick Endowment* and *Burial Club*; DIVIDES THE WHOLE OF THE PROFITS AMONGST THE MEMBERS; and is enrolled under Act of Parliament, and certified by J. Tidd Pratt, Esq.

It provides a *Weekly Income during Sickness*, a *Pension in Old Age*, £10 to £200 at *Death*, and *Endowments* up to £200. 1s. 7d. per month at 23 years of age, will secure 15s. a Week in Sickness, with Medical attendance and Medicine. 4d. per month at age 18 will secure £10 at Death. 1s. 1d. per month will secure £10 at a period of 13 years hence. Agents wanted in Districts not represented. Rules, 6d. Tables and every information may be obtained by applying to the Agents, or

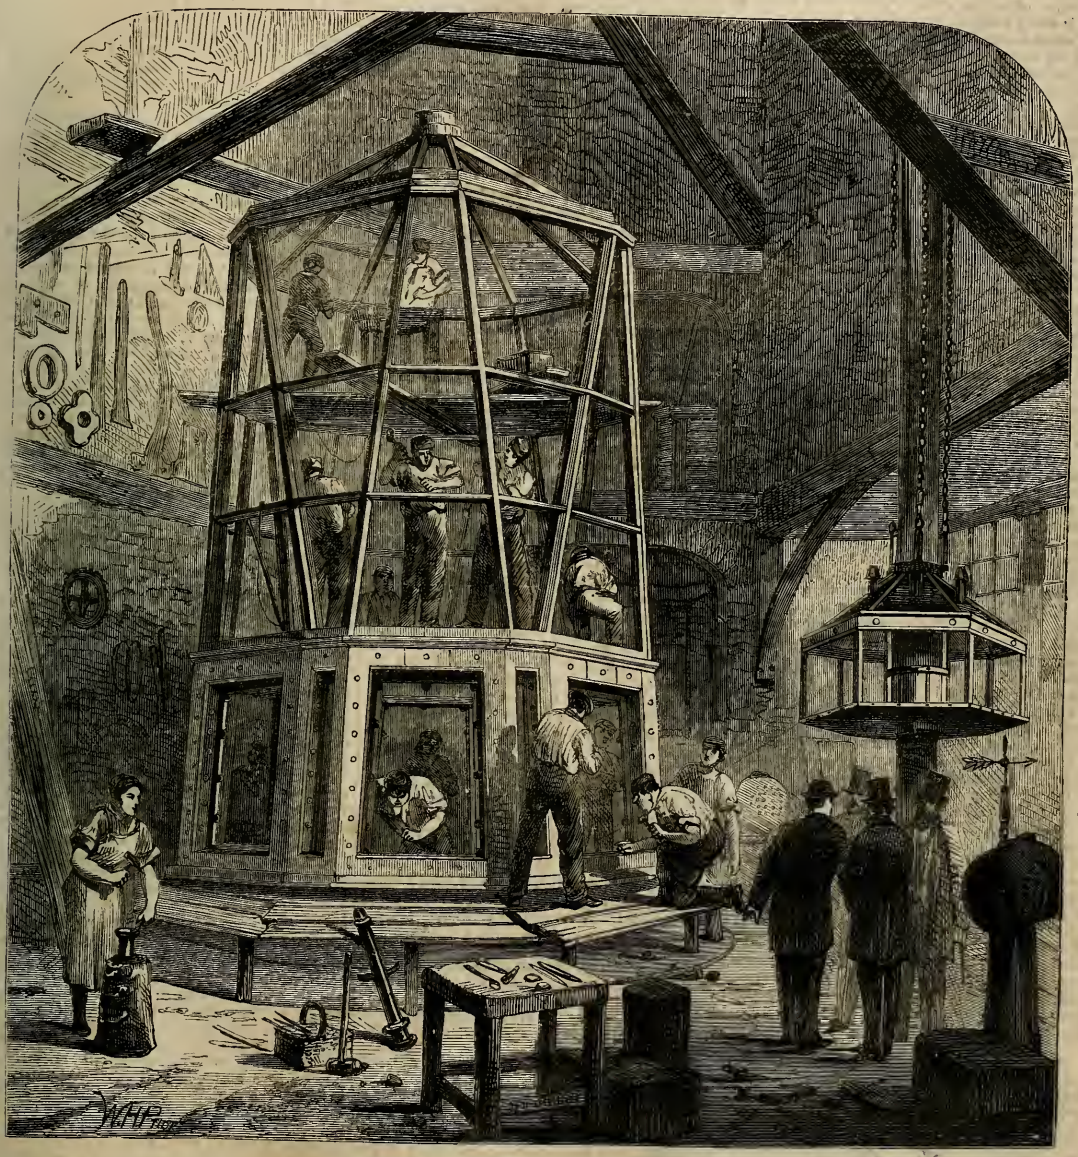
THE WORKSHOPS OF THE WORLD.



INTERIOR OF A LIGHTHOUSE LANTERN MANUFACTORY.

The Lighthouse Lantern Manufacture.

AMONG the numerous branches of our engineering and mechanical industry, none are more curious or more interesting than that connected with the production of those immense lanterns which crown the summits of the lofty beacons whose warning light bids the adventurous mariner beware of the dangers which lurk in their vicinity. The use of lighted beacons for the purpose of guiding or warning seamen approaching near a dangerous coast, is of great antiquity, the most celebrated lighthouse of ancient times being that erected about B.C. 283, in the reign of Ptolemy Philadelphus, on the island of Pharos, opposite to Alexandria; but it was not until a comparatively recent period that the methods of lighting employed in these structures were conducted upon anything like scientific principles. The lights were fed with oil, and in some cases reflectors of glass or polished metal were used, but no attempt was made to concentrate or economise the rays of light in such a manner that they should be rendered visible at the utmost possible distance at which a light could be perceived.

To effect these results, great improvements had to be effected, both in the construction of the lamp and in the arrangement of the glass windows which protected the lamp from the wind and rain. The light was required to burn with a steady and uniform flame, while, at the same time, it became obvious that the windows might be made something more than a mere protective covering; that they might be so constructed as to assist in concentrating and intensifying the rays of light emitted by the lamp or lamps. This led to the gradual adoption of the system of lighting now used in this and other countries.

The principal mode of lighting, as practised in this country, consists in placing a powerful Argand burner in the focus of a large parabolic reflector. This latter is made of silver strengthened with copper, or of copper strongly plated with silver, and is about three or four inches in focal length, and about twenty-one inches in diameter. It is of great importance that the sizes of the flame and the reflector should be scientifically adjusted, otherwise there would be a considerable waste of light. In France, the mode of lighting generally employed consists in placing a large Argand lamp, having four concentric wicks, and giving an extremely powerful light, in the centre of the lantern, a series of glass lenses, of peculiar construction, being scientifically arranged round the lamp. This gives a *refracted* instead of a *reflected* instrument to collect the light, and enables a single lamp or light to produce an effect otherwise obtainable only by the use of several. The lenses employed in this manner are each about thirty inches in diameter, and having a peculiarly arranged fluted surface, difficult to describe without the assistance of diagrams.

The reflecting lights are known as *catoptric* lights, while those in which lenses are employed are called *dioptric* lights. Each system has its special advantages, but the dioptric method is considered to be the most efficient.

Considerable ingenuity is required in devising the various peculiarities by means of which mariners are enabled to distinguish the various lighthouses from each other. In some a steady light is exhibited, which may be coloured by the use of coloured glass; in others the light is intermittent, that is, it is made, by means of machinery, to appear at certain regulated intervals; in fact, the varieties of lights are almost endless.

The construction of the framework of the lantern is scarcely less important than that of the light. Unless made of strong and sound materials, and finished in a workmanlike manner, it would not long withstand the fury of the destructive gales which so frequently sweep along the coast. In our illustration we have represented the ordinary method of constructing the lantern, the metals employed being chiefly gun-metal and iron. All the parts have to be made and put together in the workshop, after which the lantern is taken to pieces for the purpose of being more easily conveyed to its destined locality.

The workshop represented by us forms a portion of the establishment of Messrs. Wilkins and Co., the celebrated lighthouse engineers, of Long Acre, London. The smaller lantern shown in the illustration is intended to be placed around the mast of a light-ship, of which we have many, such as the well-known floating light at the Nore, in places where the navigation is intricate, on account of sand-banks and shoals, as at the entrance of large tidal rivers, like the Thames or Mersey. The pedestal of the large lantern depicted by us is made out of cast-iron, the framing of gun-metal, and the roof of copper; the whole being surmounted with a copper ball and vane—shown in the engraving—for purposes of ventilation.

Employment for Women in Germany.—An association has been formed in Berlin to promote the industrial employment of women, especially of those belonging to the middle classes of society. Although in England a similar undertaking has been affiliated to the National Association for the Promotion of Social Science, in the metropolis of Prussia the new movement is still regarded by many persons as likely to alienate women from their "manifest destiny." A hearty meed of praise is due to the eminent men who have placed themselves at the head of the Berlin association. A still larger share must be bestowed on her Royal Highness the Princess Royal, for openly professing a great interest in the object of the society, and for contributing a considerable sum of money to its funds. In the kingdom of Würtemberg, by an order of the Government recently issued, women are admitted to appointments in the postal service.

Employers and Employed.

Having explained, in our article entitled "Master and Servant,"* the chief principles of the law concerning the contract or engagement entered into between employer and employed, we have now to consider

II.—THE DUTIES AND LIABILITIES OF BOTH PARTIES

during the continuance of the service.

The first duty which civil as well as moral law exacts from the servant, is proper and faithful performance of the service entered upon. He must show himself *competent* to perform his work, and do it, not in a careless or negligent manner, but with due diligence and attention. He is also bound to obey the master's commands, so far as they relate to the employment, and, if he be an in-door servant, must conform to the rules of the establishment. Any breach of these conditions will justify the master in putting an abrupt termination to the engagement, and, if the case be a clear one, the law will uphold him in refusing to pay the servant the stipulated salary, or any portion of it.

It must be noted that the servant who has undertaken one description of service, cannot legally be called upon to perform another. To take, as an illustration, the case of domestic service, a person engaged as coachman cannot be required to act as footman; and so with respect to any other class of employment. He may, of course, undertake other duties by his own consent; but if he should do so simply as a matter of temporary accommodation to the master, he will not be bound to perform them during the remainder of the engagement.

A servant must exercise due care over his master's goods. He is liable to the master, not only for wilful damage, but also for injury to his property through gross negligence. But it is a mistake to suppose that the law gives the master power to deduct the amount of damage from the servant's wages. His only legal remedy is by *action*, which may be brought in the County Court. Nevertheless, practically the matter remains much the same as if it were left in the master's hands in the first instance; for the master may *withhold* the servant's wages if he refuse to allow the deduction, and compel him to take legal steps to recover them. He may then bring a counter action for compensation, against the claim for wages; and if, as is probable, each party has to pay a part of the costs, both will be the losers by resorting to legal process. Therefore, it is not the servant's interest to refuse to allow the deduction, if he be fairly liable to it, and the amount be reasonably estimated.

Finally, as regards the servant, if he involve the master in adverse proceedings through any careless or illegal act of his own, he is bound to recompense or indemnify the master for the expense to which he may be put in consequence. For instance, if, by negligently leaving a grating open, he causes injury to a passer-by, who brings an action for damages against the master, the servant is liable to repay to the master the damages awarded.

It is the first duty of the master to pay his servant fair remuneration for the service, or such remuneration as may have been agreed upon; and next, to afford him reasonable protection against injury. With respect to in-door servants, the master must supply them with proper shelter and necessaries. In the case of sickness, he is bound to continue to provide them with lodging and necessary food, but not with medical attendance.

A master is not entitled to inflict personal chastisement on his servant under any circumstances. Although the law allows moderate chastisement for misbehaviour in the case of an apprentice under age, it does not permit the infliction of such punishment upon a servant. If anything affords ground of displeasure, the master has his remedy in dismissal, which he has not in the case of an apprentice; and any corporal punishment of the servant is, therefore, an assault, for which the master is liable to action.

As to protection against injury, the master is bound to take every reasonable precaution to secure the safety, in life and limb, of his servant. He must not expose the servant to dangers of which he cannot be expected to be aware—for instance, by allowing him to work at machinery which the servant would presume to be safe, but which the master knows is unsafe. If the servant see, or be made acquainted with, a danger, and choose to continue his work notwithstanding, he does so at his own risk. But he may lawfully refuse to do any dangerous work; and if the master should persist in requiring it, the servant will not be debarred from the right to his wages by the refusal, so long as he may hold himself in readiness to perform his proper duties.

The Factory Act renders it incumbent on a master, in whose factory machinery may be employed, to fence such portions of that machinery as may be dangerous to those at work at it, or to passers-by. Any person who is injured through the absence of proper fencing may recover damages for the injury from the occupiers of the factory; but the master is not bound to keep machinery fenced while it is not in motion; and he is not liable for damages if the servant contributes to the injury by his own negligence.

If the master takes care that his servants are persons of proper skill and ordinary carefulness, he is not liable for any injury that one may receive by the negligence of another in a service which they are performing in common. The servant's remedy in such a case is against his fellow-servant. And if the servant discovers that he is exposed to danger by the incompetence or carelessness of another, and, nevertheless, continues to go on with the work, the master is not answerable for the consequences.

Corresponding to the duty of the servant to indemnify the master for the results of his own negligence, is that of the master to indemnify the servant for the consequences of any act done at his own bidding, and not in itself contrary to law. But if the servant do an illegal act, knowing its true character, he can claim no indemnity from the master. On the contrary, where such an act is performed by the master's instructions, both parties are liable to punishment.

A master is liable for the acts of his servant, even where he may not have given express instructions, but where such acts appear to have been done in the ordinary course of business known to and sanctioned by the master. In the case, for instance, of a fraud on the revenue committed under such circumstances, the master is answerable; and it may be, although this does not in all cases follow, that the servant also is amenable to the law.

As a general rule, however, the servant is liable, under the criminal law, for a wrongful act; but the master is not liable for the wilful act of his servant, done without his knowledge or consent, and not coming within the proper scope of the employment.

If a servant, in course of his ordinary occupation, or any other act of service, inflicts an injury upon any person by negligence—as in the case of the driver of a vehicle, who may run over a person in the streets—the master is liable in damages to the person injured; but he is not liable when that person, by the exercise of ordinary care, might have escaped the consequences of the servant's carelessness or misconduct.

A master is liable to third persons under contracts or engagements made by his servant, if that servant is acting with his authority, either express or implied. Express authority is where the authorisation is given in so many words; and authority is implied where, according to usual practice, the servant is understood to act on behalf of the master as his agent. A foreman, as we mentioned in our last paper, has implied authority to take on other workmen; a shopman has implied authority to warrant his master's goods; a "traveller" has implied authority to collect his master's debts. The master may relieve himself from his liability for any such acts, by notifying by public advertisement, or to those persons with whom he may deal, his refusal to recognise the servant as any longer an agent in his behalf. It is not sufficient merely to forbid the servant to act, without giving the public or the customers such notification.

With regard to a servant who may purchase goods for the master, if the latter has always been in the habit of paying ready money, he is not liable for what may have been obtained on credit without his written order. But if the master is known to send for the goods, sometimes with ready payment, and sometimes on credit, he is answerable for what his servant may obtain on credit, within a reasonable amount, whether it has been procured for his own use or not.

---

* See page 118.

Where a servant has no authority to act for the master, either by express sanction or by common usage, the mere fact that he is a servant will not be sufficient to bind the master in any way for the engagements he may enter into. The servant is answerable in damages at the suit of the third parties for any undertaking so made without the master's consent.

In our next paper we shall explain the provisions of the law as to Wages.

A Sad Story.

BY A LANCASHIRE LAD.
